OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

In meeting the war needs of the country California has not disappointed her warmest admirers. Not only have the products which this state yielded for years been greatly increased, but development or increase along new lines have made this state a commercial factor where before she was only making experimental planting. For instance, in rice and in cotton California has added to the country's production nearly $10,000,000 each. We are glad this week to give some illustrations taken in Southern rice fields, with a Californian's estimate of the worth of the industry to this state.

In addition, from Arizona we have an article written by Mr. Bemis, touching upon the great long staple cotton industry of that section. Arizona has proven a wonderful help to the world in the prosecution of the war through the furnishing of long staple cotton which is not grown in the South. There will be particular interest to Californians in Arizona's accomplishment for we are joining Arizona in production of this much needed long staple. Imperial Valley's greatest production has been of an improved short staple cotton. The San Joaquin Valley is now planting almost exclusively to the long staple. We give on cover page a view of an Arizona cotton field.

"Extravagance costs blood, the blood of heroes."—Lloyd George.

W. S. S.

The day of W. S. S. pledging has passed, and it appears the pledges indicate a liberal enough purchase of war savings stamps will be made to cover the two billions asked through this method. The best part of the campaign is that feature which calls for economy and conserving of our funds to be ready to make these purchases.

THUNDER!

Southern California was visited by a freak storm the last day of June and first of July. It was an electrical storm very much like the ones we were used to "back in the states". Lightning struck in the mountains and caused several mountain fires, destroyed oil tanks, and played havoc with the long distance transmission systems. In some sections a downpour accompanied the electrical manifestation, but the damage from rain will be limited.

HOLD BONDS

There have been many cases where purchase of liberty bonds has been made, possibly under a certain degree of pressure, and the purchaser has almost immediately turned and made sale, and, of course, always at a discount. This has resulted in speculation which in the open market means a slight shading. Worse, there were early in the bond campaign many merchants who advertised to accept the bonds, encouraging the purchasers to transfer them, and the same result was accomplished through the merchant putting them later on the market. The government is taking a stronger hand and urges everyone to hold his bonds till the end of the war.

The main duty of noncombatant Americans briefly may be stated as follows: Increase production, economize in consumption, lend your savings to the government, and hold your liberty bonds.

FOURTH LIBERTY LOAN

No announcement is yet made as to the next or fourth liberty loan, but the treasury is asking of bankers subscriptions to treasury certificates of indebtedness which will bear four and a half per cent and mature October 24. This is no indication that the next bond issue will carry other than four and a quarter, in fact, Mr. McAdoo states: "No thought has been entertained of issuing the bonds of the fourth loan at a higher rate than four and a quarter per cent." He is urging that future government loans be stabilized at four and a quarter. He says: "As an intelligent people we should make a stand for financing our government during the period of the war at a stabilized rate of interest," naming four and one-fourth as the proper figure. The patriotism of the American people is not measured by the rate of interest on government bonds. This was indicated in the result of the third liberty loan drive and the war stamp drive.

COSTING MONEY

The financial cost of the war at the present moment is around 50 millions of dollars daily, or about 12 times the cost of running the government before the war. It seems like a great cost until we stop to consider that, divided amongst the people of the land, it aggregates only a matter of 50 cents per day for each one of us. Of course this has to do with the actual cash cost through the government, and not to the cost through increased price of commodities which we all bear less wilingly than we do the war's direct cost.

It is now proposed to raise one-third of the direct war cost during the coming year by taxation. Instead of relying upon the four billions which is raised under the present taxation scheme, it is urged that congress shall revise the tax law so as to raise eight billions, and it is suggested that this should largely be through the levying of a very heavy excess profits tax. In addition the secretary of the treasury has recommended that there shall be a substantial increase in the amount of normal income tax.

"LOTS OF LABOR"

The fruit harvest finds the labor situation most serious. Some sections where best of housing conditions obtain and long wages are paid are harvesting and curing crops satisfactorily. For those industries that can pay the price during a short harvest time the loss from labor shortage will not be great, but industries requiring 365 days of service each year cannot pay the long prices and are suffering seriously. Swine production in the Imperial Valley for instance: The cantaloupe production has been great; the necessity for harvesting quickly made it imperative that plenty of help be secured; long prices were paid, these prices ranging from five dollars up according to skill required. This resulted in the producers of hogs, dairy foods and other 12-month in the year productions, being embarrassed.

Patriotism impelled the sending of numbers of high school pupils to all producing sections. Some of these were quick to take a hand and do their best; others who were offered places on alfalfa and hog ranches at $60 and $70 per month and board refused to take the job unless paid $90 and board, but in any case preferred positions where they could direct other laborers. This from youngsters from the city of Los Angeles who have never done any practical work on a farm. It now appears that the labor and feed situation will result in hundreds of cars less of hogs being shipped from the Imperial Valley this year than during the past year.

In referring to the labor situation the department of agriculture called attention to the fact that in many towns and cities stores are closed and merchants and clerks take a hand in harvesting operations, and adds; "Unselfish service is the imperative demand of the hour." All honor to such service, but meanwhile the farmer desirous of dependable year in and year out service is up against it.

This Week's War Notes

In general it may be said that it is a week of disaster for the Teutons.

The war has now arrived at the place where it is costing the American people $50,000,000 daily.

At a Red Cross fair held by Germans in Cologne a few American prisoners were exhibited in a side show at ten pfennig admittance.

Arrests of 20 persons were made at Nogales, Arizona. It is charged the men were fomenting revolution in Mexico. They had charge of over 20,000 rounds of ammunition and a large supply of rifles.

Submarines are still in action as shown by the sinking of Landovery Castle, a Red Cross ship on its way to England from Canada. She had on board 258 nurses and members of the medical corps; only 24 are as yet accounted for.

The new army bill as passed appropriates 12 billion dollars and provides for any army of three million men, for the organization of Russian fighting legions, formation of government controlled aircraft corporation with a capital of a hundred million, and many details which will guide in the work of the coming few months.

The "work or fight" order which went into effect Monday morning resulted in police war squads making raids on various pool halls and places where loafing is permitted. Warning was given that the new regulation would be enforced to the letter. It is to be hoped that a vast number of the useless callings may be abolished and husky young fellows be put into useful labor.

General Diaz is receiving congratulations from every quarter. He has succeeded in driving the Austrians back at almost every point. The victories along the lower Piave are now being equalled by those in the mountain sections. The Italians are advancing very cautiously and are prepared for any trap. Most careful estimates now place the number of Austrians killed at between 50 and 60 thousand and total Austrian losses at exceeding a quarter of a million.

The Allies are concerned over the great quantities of ammunition and provisions stacked up along the Archangel railway, waiting transportation to Russia. These supplies accumulated during the first years of the war when the Russians were still fighting with the Allies. Only a narrow gauge railway was available to transport them; the Russian government began putting in standard gauge, and the work was only completed when the German peace was signed at Brest-Litovsk, since which time the Germans have been endeavoring to get control of these supplies through the Bolsheviki or the Finnish White Guard acting under orders from Germany. There is now a force of British, French and American marines in the harbor of Kola, Archangel Province.

"The Yanks are coming"—more every day, and it is now rumored that they are distributed over at least 70 miles of the battle line. The efficiency of the American troops is shown in every action in which they have taken part. Artillery action has increased in fury, millions of gas shells being used. There has been during the past week no extended infantry action, and such raids and minor activities as have occurred have been initiated by the Allies. The Yanks came to the aid of hard pressed French in Lorraine, singing, "Hail, the Gang's All Here." Soisson is apparently to be the center of the next plunges of the Germans. This will take in a sector in which the American boys will have opportunity to show their mettle in a larger way. The German war office has admitted that British troops have advanced over a five mile line. The British report the capture of many machine guns, also a trench mortar and larger guns. It has been a terrific jolt, according to report from Amsterdam, to Ludendorf, Hindenburg and their troops to learn the number and effectiveness of the American troops already in France.

The Russians seem to be slowly making up their minds to oust the Bolsheviki. It was rumored for a time that Grand Duke Nicholas had been made czar. Officers and men of the Russian army are flocking to Moscow where an army is being formed under General Alexieff. Grand Duke Michael is also organizing an army at Omsk. Amnesty is being offered to all who assist in rebuilding a stable government. The Czecho Slavs are still holding the trans-Siberian railway. In the extreme north the government of Archangel has proclaimed a state of war; in the south the Germans are in entire control of the Ukraine. However, a large number of mine layers and small cruisers of the original Russian Black Sea fleet have been concentrated at a port in northern Caucasia where they are organizing opposition to the Turko-German advance. Kerensky is in England appealing for allied assistance, and Mme. Botchkareva, leader of the Woman's Death Batallion, is in Washington urging an Allied force of 100,000 American, British, French and Japanese troops in Russia as a nucleus for an army of a million.

Arizona Long Staple Cotton

By M. E. Bemis

A FAVORITE indoor sport in Arizona is discussion of the question, "When and where was the beginning of what is now generally recognized as the biggest single agricultural industry in the state—the growing of Arizona Long Staple Cotton?" Among old timers there is no agreement as to the beginning, but from the oldest inhabitants down to the newest arrival there is a gratifying unanimity of sentiment regarding the value of the crop to the grower and to every citizen, for indirectly all have been benefited, and to the world at large.

It really doesn't matter much to those of us of today, who had the somewhat doubtful honor of growing the first cotton, because first the short staple cotton which was tried out was not a tremendous success, or at any rate so far as we can learn the same man did not grow it but once, and anyway the early settlers were not the pioneers in the Arizona cotton game because the Indians had grown so far back that its beginning with them is only legendary. Then too before the Indians there were the prehistoric races that built cities that have now crumbled and left only mounds, canals that once carried water from the rivers to the thirsty desert lands and dwellings in the cliffs in the headwaters of the rivers. These people passed away and left no written records of their achievements—nothing remains save these monumental ruins, but within these ancient dwellings we find many things that help us to guess of much of their lives, and among other things we find cloth made of cotton, and we know that they, before the Indian and ages before the white man, grew cotton in the valleys of the Salt and the Gila.

The cotton of the ancient races, the Indians and the early white settlers, was a far different staple from the splendid fibre that is now produced, though it is said that about 35 years ago a bale of cotton was grown near Phoenix which was sent to the New Orleans Exposition and received a premium.

The real beginning was made about 1901 or 1902. Some seed of the Egyptian cotton was planted at the old experiment station northwest of Phoenix. It is said that yields of one variety produced as high as 460 pounds of lint cotton to the acre. For some unaccountable reason no further experiments seem to have been conducted by the state experiment station, but about this same time the United States department of agriculture took up the work, planting a number of varieties at Bard just across the Colorado on the California side from Yuma.

The objects of these early experiments were two fold, first to find a variety that would be adapted to Southwestern conditions and second to gather data on when to plant, how to thin and how much and when to irrigate. At first thought it would appear that since the country along the Nile, where the Egyptian long staple is grown, is similar in many respects to our own irrigated valleys such as the Salt River, Imperial and the Yuma, that any variety that would succeed there would succeed here and cultural methods that were successful there would prove correct for this country. This has not proved altogether true however, and it has required endless patience and untiring efforts on the part of the pioneer experimenters to adapt the Egyptian cotton to Southwestern conditions.

In 1907 experiments were discontinued at the Yuma station and then work taken up at the government station at Sacaton on the Pima Indian reservation about 40 miles south of Phoenix and on the Gila River. All the work was done under the direction of officials of the bureau of plant industry, United States department of agriculture. Among those most actively interested and to whom we are in consequence most indebteded should be mentioned Thos. H. Kearney, O. F. Cook, W. T. Swingle, C. S. Scofield and Chas. J. Brand. The work of supervision, recording results and gathering data was done by E. W. Hudson, superintendent of the Sacaton experiment station from 1907 to 1916 and during the last named year field agents acting in cooperation with the state agricultural service and the United States department of agriculture. At the present time Mr. Hudson is employed as agricultural adviser for the Southwest Cotton Company, mention of which will be made later. He is regarded by cotton growers as the highest authority on the growing of long staple cotton in America.

Brings Wealth to the Southwest
Boll long staple cotton grown in Arizona.

Progress was rapid from 1907 to 1912. One variety had been proved to be adapted to its new home; cultural methods had been well worked out and a considerable quantity of seed had been selected and saved, so in the spring of the year 1912 about 400 acres of cotton was planted in the Salt River Valley. About half of this was planted by Herbert Atha on his farm north of Phoenix. The previous year he had experimented in a small way, but sufficiently to become enthusiastic over the possibilities of cotton growing. About 20 different farmers in the vicinity of Mesa also planted small acreages that year. All of this did very well, and two gins were built, one at Mesa and one on the Atha farm. It might be mentioned in passing that the gins for the long staple cotton are the so-called knife gins instead of the saw gins used for short staple.

The success of Atha and the Mesa growers made cotton growing contagious, and the following year there were about 4000 acres planted. Most of this did splendidly in spite of the fact that many inexperienced growers were trying out new methods.

The following year the acreage increased to 10,000 acres. This was the year of the outbreak of the big war; cotton prices went down to 18 cents a pound for the long staple. Even at this price fields that had had careful culture yielded so well that they paid a profit. The price remained so low during the winter that the following year the acreage dropped back to about 4000 acres, prices began to advance and the following year, 1916, more than 7000 acres were planted in the Salt River Valley and a small acreage around Tucson and also in the Casa Grande Valley.

So far the variety planted had been the original selection of seed from Sacaton, which was and still is known as the Yuma Variety, but this season a new variety which has been selected and bred from one single plant and named by the originators at Sacaton the "Pima" was put out among a few careful farmers, 275 acres being planted of this variety, and the seed carefully saved for planting the next year. Some of the cotton from these fields brought as high as 56 cents a pound, and all cotton in 1916 brought good prices so that the next year, or 1917, the acreage jumped to 34,000 acres in the Salt River Valley alone. Several thousand acres of this was planted to the new and improved Pima. These fields were carefully "rogued" under government supervison and sufficient seed obtained to plant the greatly increased acreage of approximately 75,000 acres the present season in the Salt River Valley. In the Casa Grande Valley and in the Yuma Valley there are several thousand acres of the old Yuma variety. The 1917 crop has sold for 65 to 70 cents a pound for the most part, some selling for more.

Gins have been built in various parts of the valley to accommodate the growers, and several more will be built this season to handle the big crop that is being grown.

The average yield of lint cotton is something under one-half bale to the acre. This rather low average is due to the fact that a great deal of cotton is grown on new land, and yields from such land are generally about half what they are on similar land which has been in cultivation, especially if it is old alfalfa land.

The following are actual results that have been obtained and prove that tried methods are best and are an indication of what we may expect when cotton is grown in a well planned rotation:

Last year a young Mesa rancher, who does not wish his name to be mentioned, purchased ten acres of land and put it into cotton. He did all the work himself with a small amount of outside labor and cleared enough on the cotton to pay the entire purchase price of his land, which was $200 an acre.

J. L. Alexander, (now deceased) raised in 1917 five acres of cotton. His farm was located just a little northeast of the Indian school near Phoenix. His cotton field was a little less than five acres, but he produced 12,000 pounds of seed cotton, or one and one-third bales of lint cotton to the acre.

Warren Parker, manager of Frank Parker's farms, produced in 1917 on 20 acres, 20 bales of cotton. On seven acres of the 20 he produced 2150 pounds of seed cotton to the acre or nearly one and one-quarter bales per acre.

On the Germann ranch at Higley, which is just outside of the Salt River project, but part of the great Salt River Valley, nevertheless, there was produced on a five acre tract last year seven and one-half bales of cotton.

A full blooded Pima Indian on the Pima Indian reservation near Sacaton, on a 12 acre field cleared $200 an acre over his expenses, which included part of the labor of producing and all of the cost of picking. It is interesting to note that this Indian, whose name is Juan James, purchased $500 worth of liberty bonds and thrift stamps out of his profits.

The cost of cultivating land with present prices of land, labor and tools may be estimated about as follows:

Rent of land $25 to $30; (some land owners make terms of 20 per cent of the lint cotton in lieu of cash rent); water, $1.25; thorough preparation of an acre of land, $5.00; planting including seed, $2.50; hand hoeing and weeding, $6.00; man and team for nine months, $30; picking 1800 pounds of seed cotton at three cents, $54; ginning, $12.

This makes an expense of about $140 an acre, and many do not expend this much, but for best results, such as examples noted above, thorough work is necessary, and this is expensive. Yields of one bale to the acre are possible and will in time I believe be the rule rather than exceptional. A bale of 500 pounds or 1800 pounds of seed cotton at 60 cents would bring $300 and at least $20 more for the seed, which would leave a profit that would almost pay for the land.

The labor required to pick the cotton is considerable and especially with as large an acreage as that which was grown last year, and of course more than double this year. Last season a considerable number of Mexicans were imported, many of them being brought in from Mexico by special permission of the United States labor department. It is believed that similar measures this season will insure planty of labor to harvest the crop. Many Indians from the near by reservation are employed and make good hands. The growers are well organized with local associations in the several localities and one central association at Tempe.

Long staple cotton is used for a variety of purposes, such as the making of thread and mercerized goods. The most important use yet, and one which has created a demand far beyond the amount produced, is for automobile tire fabrics. The fibre is exceptionally long measuring in the Pima variety one and one-eighth to one and three-quarters of an inch in length.

Another use which may make it even more valuable now is for wings for airplanes. There seems to be a fairly good prospect that a considerable quantity of the long staple Arizona cotton will be used for this purpose.

The cotton industry in Arizona has received a wonderful impetus through the efforts of the Goodyear Rubber Company of Akron, Ohio. Experts found in 1916 that the cotton grown in the Salt River Valley of Arizona was especially adapted to the manufacture of the fabrics for automobile tires, and this great company immediately took steps not only to produce it but to finance and otherwise assist local growers to produce more and a better quality. In all about 30,000

Continued on Page 7

Agricultural News Notes of the Pacific Coast

Northern California

Tehama County is to have a farm adviser.

Northern citrus sections show promise of normal crop.

Butte County reports its prune crop in excellent condition.

Grass Valley, Nevada County, reports pear blight under control.

Sutter County peach growers are selling their fruit at $60 per ton.

Women cherry pickers in Placer County earn from $2.00 to $4.50 per day each.

Wool Administrator Jastro will soon call a meeting of wool producers of the state.

Sonoma County cattlemen recently met at Santa Rosa and decided to organize a county association.

Field Representative Dargitz of the farm labor committee is planning to import 5000 Mexicans if found necessary.

A large bean grower near Sacramento finds very satisfactory returns from women's work. He is paying 30 cents per hour.

Vacaville now has its first woman's land army, 25 women from San Francisco aiding in farm work. Military camp rules prevail.

Dr. H. A. Payne of the United States department of agriculture is investigating hog cholera conditions in Sacramento County.

Boys and girls of the high school of Jackson, Amador County, have joined the working reserve and are picking fruit and working in canneries.

Most wool growers have completed shearing. Sonoma and Mendocino clip is commanding around 64 cents. Lower grade wools are running around 50 to 57.

Creameries of Eel River Valley, Humboldt County, paid for May butter fat 47½ cents. This is the highest price paid by these creameries at this period of the year.

Peach growers have practically settled upon an 11 and 12 cent price, or rather, recommendations to the food administration. Washington has made no announcement as yet.

The "king" of the fish market in San Francisco has been ordered by the market commissioner to close his place of business for ten days because of alleged violation of law.

The farm bureau of El Dorado County is appealed to to manage the the purchasing of a threshing outfit which will save the ripened grain in Pleasant Valley and other sections of the county.

Expert sheep shearers are commanding at piece rates $40 per day, and one man is reported as having asked increase that would amount to $60. Present shearing rate is 15 cents per head.

The great Berkshire, Grand Leader 2d, formerly owned by A. B. Humphrey, recently died in Pennsylvania where he was sold by Mr. Humphrey after his winning of grand championship at the P. P. I. E.

The Ferndale cow testing association is closing its ninth year. The average production for the 3193 cows for the past year is 304 pounds fat. The highest herd average is that of J. W. Coppini, 510.3 pounds fat.

Central California

Apricot harvest at Hanford, Kings County, is in full swing.

Hughson, Stanislaus County, is harvesting a big honey crop.

Stanislaus County barley fields are producing 10 to 12 sacks per acre.

Corcoran, Kings County, reports its long staple cotton as doing exceptionally well.

Grape men of the San Joaquin Valley met in Stockton, June 27 and discussed standardization.

Modesto reports its warehouses will be more than filled with Stanislaus County's big grain crop.

Alfalfa growers of Woodville, Tulare County, have organized for the purchase of marketing alfalfa.

Some damage to stone and citrus fruits is reported in the San Joaquin Valley from the June hot spell.

Riverbank, Stanislaus County, found no difficulty in securing sufficient help in harvesting apricot crop.

Watsonville and Hollister have agreed to stand together and observe the same labor regulations and prices.

San Joaquin Valley has planted extensively to beans, and the output will probably be much greater than last year.

Tulare County dairymen were recently paid $141,000 in cream checks; this for cream delivered during the month of May.

Fresno district fair is planning for the largest exhibition of farm boys' achievements in the history of the San Joaquin Valley.

While Tulare County dairymen have been pressed to make expenses Dairy Inspector Peairs reports most dairymen have done well.

San Jose Grange Patrons of Husbandry will hold a patriotic meeting in San Jose, Saturday, July 6, also an all day meeting July 29.

California's pear crop which broke all previous records in 1917 is reported as averaging this year about 95 per cent of a normal crop.

The largest single owned acreage of improved property in the Terra Bella irrigation district is owned by a San Francisco Chinaman, Two Mock.

San Joaquin County fair directors recently met at Stockton and because of financial and other conditions decided not to hold a fair this year.

Merced is shipping large quantities of tomatoes, bell peppers, garlic and summer squash. It is proving a very profitable early truck crop section.

The horticultural commissioners of San Joaquin Valley and grape growers are to hold a meeting Thursday of this week and discus standardization.

Tulare business men are discussing the providing of a fund for financing any farm or food production scheme which needs financial encouragement.

United Farmers of Santa Clara Valley have fixed on $3.50 as standard pay for workers in fruit harvest for a ten hour day. The members also have agreed not to entice help away from neighbors.

San Joaquin County farm bureau have resolved that: "If the city of Stockton votes dry for the period of the war, then we ask the board of supervisors to grant no more liquor licenses in the county outside the city."

Southern California

Hemet, Riverside County, canneries will open July 5.

"Finest quality ever" is declared as to the apricot output.

Imperial Valley shipped its first full car of honey June 20.

Antelope Valley live stock men report grazing still good.

Nuevo, Riverside County, is harvesting an immense crop of potatoes.

Suburban electric lines of Southern California are asking for increased rates.

A million dollar cement plant is to be built at White Water, Riverside County.

Hemet apricot dryers are using 150 high school boys and girls in the apricot harvest.

Orange County citrus growers are offering liberal rewards for capture of fruit thieves.

Imperial Valley hog raisers find milo grain fully equal to corn as a finisher of hogs.

Victor Valley, San Bernardino County, is still working for that experimental farm.

Pomona had her "goat day" last Saturday. Milch goats were present in large numbers.

During cantaloupe season Imperial Valley shipped out an average of 500 cars of food daily.

Ventura County farm bureau urges closing of all saloons in California as a war measure.

Imperial honey producers are discussing affiliating with the State Bee Keepers' Exchange.

Kenneth MacRae of Rialto has grown a 40 ton crop of oat hay as intercrop on 20 acre orchard.

The Lankershim Laconic suggests that Uncle Sam's commissary department "no savvy" the apricot.

Southern California has been given a turn at humid weather induced by thunder showers on the desert.

The Elsinore Valley Growers' Association has bought the plant and dry yards of the Dried Fruit Association.

Chino sugar factory employes are being transferred to Oxnard, which mill will handle the crop of both sections.

Farmers at Chino, San Bernardino County, are to make a trial on Saturday of this week of "Farmers Sale and Exchange Day."

Indio and the Coachella Valley generally reports the greatest season's express shipments of early vegetables since the settlement of the valley.

Hemet apricot growers met last week and discussed with officers of the California Prune and Apricot Growers Association disposal of this year's apricot crop.

Prof. H. J. Quayle will conduct a series of fumigation lessons at Covina on July 20. There will be practical demonstrations. Dr. Coit, farm adviser, will unite in the work.

Citrus growers are still watching trees to determine as to the usual "June drop." All is favorable thus far, and it is thought that at least 75 per cent of a full crop will be secured.

Lima bean growers are watching the ship building campaign with particular interest because of the announcement that the principal outlet for Lima beans this year will be by way of the Panama Canal.

The Coast and General

Oklahoma is paying harvesters $4.00 per day.

Roseburg, Oregon, is building a cannery.

Idaho reports wheat has stooled much better than last year.

Southern states report cotton in from fair to excellent condition.

Gem County, Idaho, is building more silos this year than all she had before.

Wenatchee, Washington, is materially increasing its storage facilities for fruits.

Eight hundred Y. M. C. A. boys are camped in the berry fields of Puyallup, Washington.

A cold rain in eastern Washington killed 270 head of valuable ewes for one sheep breeder.

Arizona farmers are appealing for "standardization" or wages as well as of farm products.

Merchants in some Texas towns are closing stores part of the week and aiding in harvest fields.

Isle of Pines citrus growers have found certain low-grade paraffine oils excellent in control of white fly.

Farmers are building a reinforced concrete elevator at Joseph, Oregon, with a capacity of 80,000 bushels.

Cochise County, Arizona, farmers are complaining because of invasion of their fields by Mexican parrots.

The state horticultural inspector of Washington has resigned and will take work with the United States bureau of markets.

The stockholders of the Farmers Union Mockonena Warehouse Company, Washington, recently declared a 40 per cent dividend.

Prof. Lewis of Oregon agricultural college reports Polk County walnut orchards as showing splendid growth with promise of fine crop.

Sunday picnickers near Bellingham, Washington, have been asked to go to the woods and gather spaghnum moss for the Red Cross.

It is estimated that 100 per cent of the population of Nome, Alaska, was on the wharf to greet the first steamer of the season early this month.

The biggest irrigation event in western Canada is to be the gathering of the Western Canada Irrigation Association at Nelson, British Columbia, this month.

Yakima, Washington, has been making a study of pollenization of cherries and finds that Royal Anne set near good "pollenizers" bears much larger crops.

Yuma Valley, Arizona, stock men are feeding mesquite beans to hogs and securing good returns. Indian women gather the beans and sell at $18 to $20 per ton.

A Yuma Valley date grower has been investigating date growing conditions in Mexico and hopes to find bearing dates in that country which may prove of value.

The Arizona state fair is offering free trips to girls who are members of canning clubs and boys who are doing cow testing work. There will be competition at the fair for scholarships.

Colorado farmers are being filled with the story passed on by pro-German propagandists that they should not grow certain crops because the government intends levying a five to six dollar per acre tax.

California Rice Rich in Food Value

By Arthur L. Dahl

IN THE constantly advancing procession of food prices the average American has to give thought to what he shall eat and the relative food values of different articles in the daily menu are coming in for more thoughtful attention. In the process one of the world's oldest and best foods is being given the recognition in this country it has for centuries had in those countries which are the most densely populated in the world.

Rice forms the principal food of one-half the population of the earth. It is more widely and generally used as a food material than any other cereal. Where dense populations are dependent for food upon an annual crop, and the climate permits its cultivation, rice has been selected as the staple food. It is one of the most nurishing foods in the world, is easily handled, will keep indefinitely, and it can be eaten continuously for longer periods without being unpalatable than almost any other single item of food. One pound of raw rice will increase in volume three hundred per cent when boiled; one pound of potatoes will shrink 25 per cent. Potatoes are 72 per cent water, while rice holds only nine per cent. But two per cent of rice is not digested.

Rice is rich in carbohydrates and contains little fat. Analyses show that one hundred pounds of rice contains 87.7 pounds of total nutrients, consisting of eight pounds protein, 0.3 pounds fat, 79 pounds carbohydrates, and ash 0.4 pounds. Boiled rice is digestible in one hour, and hence it is an admirable food when ease of digestion is a matter of importance. In rice producing countries rice is used in the daily food as a substitute for potatoes and wheat. It is eaten alone with a little dried fish or other material to balance the ration. Rice being deficient in nitrogenous food elements, in tropical countries where leguminous plants, such as beans and peas, grow luxuriantly, these vegetables are used very largely to balance the rice ration. In China, Japan, and Java soy sauce, soy bean cheese, or other similar product is eaten with rice in considerable amounts and furnishes a large part of the protein necessary in the daily diet. In the United States rice is coming into more frequent use as a substitute for potatoes.

Most of the rice produced in the United States is grown and milled in the states of Louisiana, Texas, Arkansas, and California. The rice grain as it is received at the mill from the farm thrasher is contained in a hard, silicious hull which incloses the edible kernel. This hull is covered with small needlelike points. Directly beneath the hull, but separate from it and attached firmly to the starchy body of the kernel itself, is a light brown bran coat. The milling process removes the hull, most of the bran layers and leaves only the starchy part of the kernel. As most of the oil found in rice is contained in the germ, which goes into the bran, very little of it becomes available for food except for stock fed upon the bran.

A Louisiana Rice Mill

The rice as it comes to the mill is termed "rough rice" or "paddy." In the mill the rice is taken to the top floor where the cleaning process begins. The rough rice goes over a machine called a "scalper" which removes the sticks, stones and other coarse material by screens and removes the dust and fine particles by suction. From the scalper the rice goes to the "clipper" which removes the long beard and stems; and from the clipper to a "monitor" which, by suction, removes light or blighted grains of rice. The product is now known as "cleaned rough rice" and it is ready for the milling process proper.

The first step in the milling process is the removal of the hull. This is done by having the grains pass through a pair of milling stones similar to the old-style flour-mill buhrstones. These stones, the top one of which usually revolves, are set some distance apart, so that the revolving of the stone causes the grains to assume a somewhat vertical position. In this position a pressure is exerted on the ends of the grain, which cracks or splits the hull, allowing the kernel to drop out.

From the stones the mixture goes to the "stone reel." This reel is a large revolving, octagonal framework covered with wire screens, the square meshes of which are usually 14 to the linear inch. The fine material, consisting of broken hulls, germs and true bran, passes through the screens, while the rice and hulls pass over the reel and are conducted to a monitor which removes the loose hulls by suction.

The rice stream next goes to the "paddy machine" which separates the rough from the hulled rice. The paddy machine is a large, mechanically-operated box shaker with zigzag divisions formed by vertical metallic plates. These plates, together with the shaking, separate the light unhulled grains from the heavier hulled grains. The unhulled grains are directed toward auxiliary stones set closer together, where the hulls are broken.

The natural brown rice from the paddy machine is conducted to a set of "first-break hullers." The huller consists of a grooved, tapering cylinder revolving within a concentric hollow cylinder so spaced as to rub loose a portion of the bran coat with as little breaking of the grain as possible. After leaving the first set of hullers the loosened bran is removed and the rice goes to a second set of hullers, where the same process is gone through with an additional quantity of bran rubbed off of each grain. During this process the grains become very hot from the friction and they are accordingly run into cooling bins and allowed to remain for several hours to regain their normal temperature. From the bins the grains pass on to their final milling process, which consists of running the grains through what is known as the "brush." This brush consists of a vertical cylindrical frame covered with a thick padding of soft leather strips. This frame revolves at a high rate of speed within a cylinder of wire screen. The rice enters at the top of the brush and is rubbed smooth by friction with the brush and screen while passing to the bottom of the machine. The rice leaving the brush is suitable for market, though it is usually graded by machines.

The by-products of rice milling consist of three substances, rice hulls, a rice bran, and rice polish. These by-products are used for various purposes, including the fattening of live stock with the bran.

The fact that rice requires to be grown in standing water restricts the localities for its culture to those where water is plentiful, the lands are level, and the subsoil semi-impervious to water to prevent excessive waste. Many such localities are found in the South, and in California. In the latter state, although the industry is comparatively new, great progress has been made and the acreage devoted to this crop now runs over 100,000 acres. Owing to the long, warm growing season the California rice is of superior quality and easily competes with the finest imported from Japan and India.

For rice culture the lands are plowed as with other grain crops and the seed is sown early in the spring. After the seed has been sown the ground is lightly harrowed and a small amount of water run onto the land to insure germination of the seed. When the rice reaches a height of from six to eight inches, the lands are flooded to a depth of from three to six inches and the water remains on the growing fields until the grain is ready for harvesting, when it is withdrawn to allow the soil to dry out sufficient for cutting the grain. While the water covers the growing grain it is kept constantly circulating or renewed, to prevent stagnation.

Rice is not a great impoverisher of the soil, especially if the straw and chaff are regularly returned to it. It is also claimed that the flooding of the rice fields restores to the soil as much nutritive material as the rice crop removes. This is partciularly true where the lands are flooded from large rivers carrying silt, such as the Mississippi.

When the rice has become fully grown and is ripe, the water is drained from the fields and the harvesting begins. Where the ground is not too soft reaping machines are used, and in other instances the grain is cut with hand sickles. Tractors, with their broad wheels or endless track means of locomotion, have been found very valuable in rice fields, as their weight is so evenly distributed and they possess so much power. that they can be successfully operated upon lands too soft to permit horse-drawn machines.

The rice is cut at 6 to 12 inches from the ground, and the cut grain is laid upon the stubble to keep it off the wet soil and to allow the air to circulate about it. After a day's curing the grain is removed from the field. The grain is shocked upon dry ground and the shocks are built to protect the heads from the wind and rain. When the weather is dry, 10 or 12 days after cutting is sufficient for completely curing the grain. The rice is thrashed in the regulation steam thrasher, or one operated by the motor of a tractor. The grain is placed in sacks and hauled to the mills, where it passes through the process already described.

Hauling Rice to the Warehouse in Texas

Three Operations Finished In Once Over the Field

JOHN DEERE

VAN BRUNT

Single Disc Grain Drill

It is war time thrift to use a Van Brunt Grain Drill. In one trip over the field it pulverizes the soil, makes the seed furrows, drops and covers the seed. The Van Brunt Grain Drill makes horse power and man power available for other purposes—it helps solve the labor problem. Besides saving labor, a Van Brunt Drill will increase your crop yield because it does better seeding.

Patented Adjustable Gate Force Feed—Insures Even Seeding

All the seed is planted at the same depth—evenly, uniformly from every feed. All the seed reaches the bottom of the furrow. It matures evenly. No seed is wasted. Thorough seeding, you know, means much towards increasing your crop production. Van Brunt Drills do first class work in any soil capable of being seeded and do not choke up in mud, gumbo, sticky or trashy ground. Save labor, save seed and increase your crop yield by using a "Van Brunt" Grain Drill.

These Books Free for the Asking

"Better Grain Yields From the Same Fields"—32 pages beautifully illustrated, telling how to select, test and plant seed. Also *"Better Farm Implements and How to Use Them"*—a 156 page text book on farm implements. Worth dollars.

To get these books just state the implements in which you are interested and ask for package B P 43.

JOHN DEERE, Moline, Illinois

TEAGUE QUALITY

CITRUS TREES

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teague's budselected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

AT IT 29 YEARS

Nitrogen Problem in Citrus Culture

PROF W. P. KELLEY of the University of California, connected with the citrus experiment station at Riverside, has investigated many soil problems, especially those which confront the citrus grower. In discussing the nitrogen problem Prof. Kelly has said:

The continued success of the citrus industry in Southern California is probably as directly dependent upon the proper maintenance of the organic matter of the soils as upon any other factor. The virgin soils in many sections contain very limited supplies of organic matter and the intensive methods employed promote rapid decomposition. Under the existing conditions the physical, chemical and biological conditions consequently tend to become unfavorable for the growth of citrus. Closely connected with and indeed almost inseparable from the organic supply, is the nitrogen question, for the nitrogen content of soils in general is roughly proportional to the amount of organic matter present, and the nitrogen occurs mainly in chemical combination with the organic matter. Therefore the methods employed in maintaining the organic supply, if properly selected, should go far toward providing the element nitrogen upon which citrus makes relatively heavy demands.

The liberal use of manure and leguminous cover crops will insure the maintenance of the organic matter, but once nitrogen is incorporated with the soil, a second and probably more difficult problem arises, namely, the securing of the maximum efficiency from the nitrogen present.

As is well known, soil organic matter undergoes decomposition as a result of biological agencies and insoluble organic nitrogen becomes oxidized into soluble nitrate. The process of nitrification is conditioned upon and susceptible of modification by many factors, some of which are physical, such as aeration, temperatures, etc., some chemical, as for example acidity, soluble salts, etc., and others biological, such as the acidity of other groups of organisms. In general the evidence to date indicates that nitrification becomes quite active in the lighter soils of Southern California wherever sufficient nitrogenous materials are present and the moisture conditions are suitable, provided an excess of carbohydrate be not present. Plowing down a strawy manure or mature cereal cover crop, such as barley, will likely induce poor nitrogen conditions for considerable time due to the action of the cellulose and carbohydrate consuming bacteria. These organisms consume relatively large amounts of nitrate in their activity and also at the same time probably seriously interrupt the process of nitrification.

In the heavier soils such as occur near Whittier, in portions of Orange, Ventura and Tulare Counties, for example, insufficient aeration and excessive amounts of water in the soils, either as a result of rain or improper irrigation, probably go far to bring about insufficient nitrification, but with the more porous soils, nitrification is likely to be quite active wherever nitrogenous materials are applied.

While it is true that nitrification takes place in the subsoils of semi-arid California, at least to some extent, the chief nitrification is largely confined to the first foot and frequently to the cultivated zone. The cover crop and fresh organic materials become incorporated with this upper layer of soil and consequently the main decompositions must necessarily take place there. Unfortunately, however, comparatively few citrus roots occur in the cultivated zone, due to interference by cultivation and unsuitable moisture conditions.

The matter of securing suitable distribution of the soluble nitrates once they are formed at once suggests itself. The furrow system of irrigation predominates, and in many sections a more or less dense plowsole occurs which often becomes increasingly evident as the irrigation season advances. Under these conditions the irrigation water moves downward to the plowsole, then laterally, carrying the nitrates with it. Considerable time may elapse before the irrigation water breaks through the plowsole, consequently the soluble nitrates are swept toward the zone to a somewhat midway position between the irrigation furrows and only a small portion is carried below the plowsole where the feeding roots mainly occur. As the season advances this tendency becomes aggravated; capillarity tends to bring nitrates toward the surface and consequently the distribution of nitrates becomes less and less favorable as the season advances. Under such conditions the nitrogen problem may become acute even where there are abundant nitrates in the upper layers of soil.

With the nitrates concentrated above the root zone, the heavy winter rains falling over the entire surface penetrate into the sub-soil, carrying the nitrates downward, thus causing relatively large losses of nitrogen. Experimental data obtained at Riverside indicate that in some cases more than 50 per cent of the nitrogen applied as fertilizers is thus leached below the point of recovery by capillarity or tree roots.

The indications are that a solution of these problems lies first, in the liberal use of organic materials including leguminous cover crops. In this way it is possible largely to prevent serious plowsole formation and secure a more uniform circulation and movement of the nitrates that are formed in the upper layers; second, the fertilizers and cover crops should be plowed down rather than be left on or near the surface. There is more evidence, however, that mulching also offers a solution of the problem. Under a suitable mulch, the moisture content of the surface soil may be maintained at more nearly the optimum point and tree roots be encouraged to come near the surface where the nitrate supply is likely to be abundant.

ARIZONA LONG STAPLE COTTON

Continued from Page 3

acres have been leased and purchased and operations were begun on a big scale. The local name of the company is the Southwest Cotton Company. A considerable tract of land about 25 miles southeast of Phoenix has been reclaimed from the desert, water being pumped from wells by hydro-electric power which is developed from the Roosevelt irrigation project. A new town is being built which is called Goodyear. West of Phoenix about 15 miles is another large tract of land that they have likewise reclaimed and which is being watered from wells, the power also being from the Roosevelt project. Another new town is being built here. In all this company has expended about $3,000,000 in development work. This past season in addition to the cotton which they produced on about 6000 acres they have purchased of growers about $3,000,000 worth.

Other tire companies are glad to get the cotton if enough could be secured to make it worth while, so that with the other demands and other uses it would seem there would be little doubt of an assured market for all that can be produced for all time.

Egyptian cotton has been a powerful factor in increasing the value of farm lands in the Salt River Valley, although it has by no means created a boom. Land values have steadily advanced in keeping with the value of the product grown. It is obvious that the profit from one season's crop should not be as great as the value of the land, or conversely the land is worth considerably more than a season's profit.

Cotton here as elsewhere has a distinct place in a well planned rotation. Here where alfalfa is at its best, the most profitable farming in the long run is that where alfalfa is the principal crop and fed to live stock. To keep the alfalfa up to its maximum a rotation is necessary, and one good money crop in a rotation where alfalfa and live stock are the basic principles of the farming fits in well with almost any sort of a rotation, that is it can be made adaptable.

Cotton is planted here in March, begins to blossom in June, and cotton picking begins in early September, continuing until after Christmas. It is an all season crop, but with good management the land may be put in a grain crop and a good crop produced the next season, leaving the land for a crop of corn or grain sorghum following the grain the same season.

In these times when it is necessary to produce both food for human beings and feed for stock, it sometimes seems that to produce a crop like cotton is not patriotic, but let us see. From each 1000 pounds of seed cotton, and it may be said that this is about the average yield for an acre of old land, we would have, besides about 400 pounds of lint cotton, 20 gallons, or 150 pounds of cotton seed oil, a most valuable food product and approximately the amount of butter fat that might be produced per acre for a farm where dairy cattle were kept. There would be, too 500 pounds of cotton seed meal, one of the richest concentrated cattle feeds and a product which is now being used to some extent for human food. We would have too, 250 pounds of cotton seed hulls, a fairly good stock food, and 25 pounds of linters of especial value now for powder making.

So while we may regret to see choice alfalfa fields plowed up to be planted in cotton, there is considerable compensation in the fact that no little amount of food is produced as well as the valuable lint. In view of the fact that thousands of acres of desert land have been brought into cultivation to be planted to cotton it is probable that in spite of the thousands of bales of cotton that are shipped out and bring good prices to the producers, that there is very little less stock feed and human food produced now than formerly, and yet it is probable that our alfalfa acreage will be less this season by 15,000 acres.

Cotton too has its value in war times even more than in peace. We hope to grow the cotton for the wings of the airplane that shall drop the first bomb on the palace of Berlin. We expect too, to equip with tires made from Arizona cotton the autos for the triumphal tour of Pershing's staff through Germany.

CAPRIFYING THE SMYRNA FIG

Written for California Cultivator
By Claude D. Tribble

SUCCESS with the caprification of the Smyrna fig depends on getting the capri figs in the Smyrna trees at the proper time. The fig becomes receptive when about one-half to five-eighths inch in diameter and when it shows a peculiar lustrous, lively light green color.

In some localities the blastophaga, or fig insect, does not issue soon enough to pollinate the first Smyrnas that become receptive, and these are lost unless the grower sends to another district where the insects issue earlier. We exchange later capris with growers who have earlier. Our season for the capri, with our many varieties and seedlings, begins from June 20 to 30 and lasts from August 1 to 15.

We place strawberry baskets in the trees and are very careful to have them shaded as well as possible, for if a capri fig is placed on hot ground all insects in it will be dead in less than an hour. About four baskets should be used in a large seven year old tree. This distributes the insects better and not so many enter the same fig.

In gathering the capri figs they should be allowed to fall on the ground so the milky end will fall in dirt to prevent the sticky gum from trapping the insects. Where capri figs are shipped the ends should be stuck in dust to dry up this milky gum.

The capri should be pushed off the tree with thumb or finger instead of pulling with the hand, which often mashes the inside and kills some of the insects. The capri begins to show a light color; the eye or hole in end begins to open and the fig softens when insects are about to issue. Pollen may be seen around the end of fig where the insects have crawled around before one may discover the insect itself.

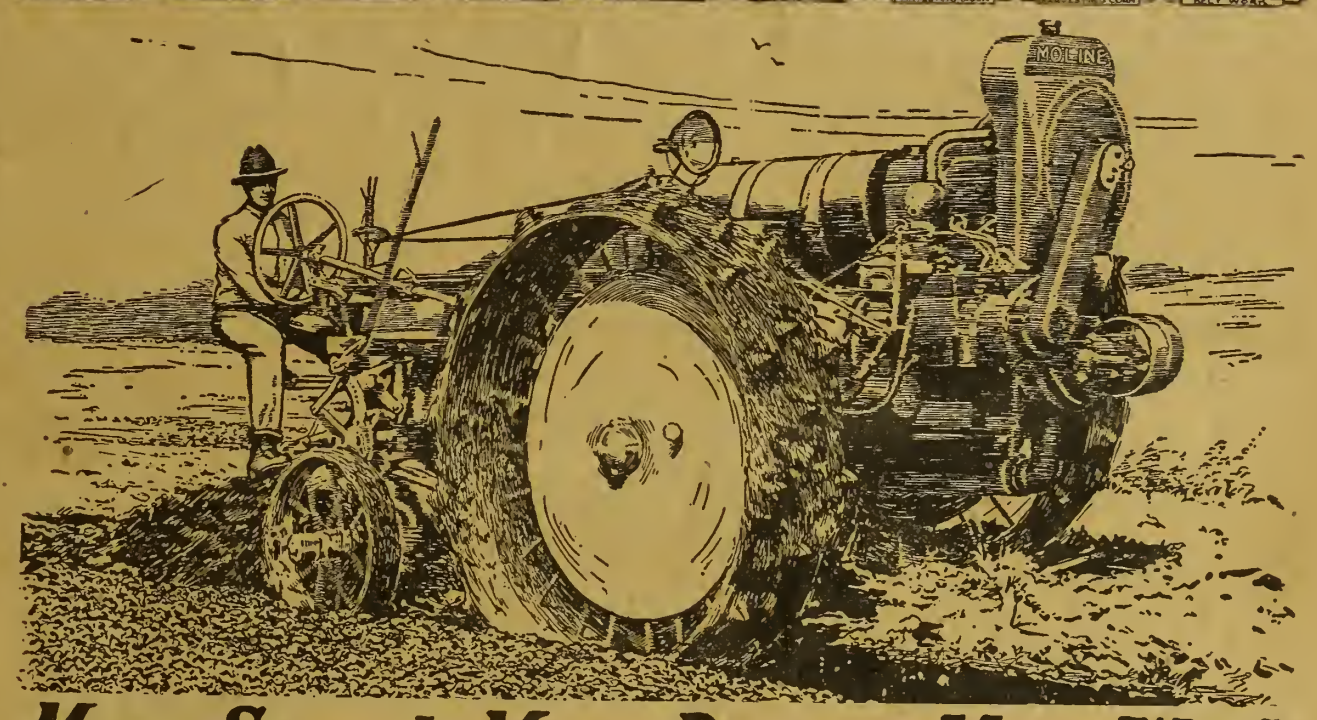
On quite warm days the first insects issue about nine o'clock a. m. and after four p. m. but few if any will be seen till the day following.

The best method is to renew the capris every fourth morning as long as they are needed or they last, and we are informed by some growers that owing to the very high price offered for the Smyrna dried figs that they will use from 60 to 100 capris per tree for this season.

Many of those who have Smyrna fig trees who buy capri figs consider caprification a failure on account of figs being too old when capris are received, and the main error is the failure to have capris sent in two or more shipments three or four days apart. Most amateurs order a few figs not knowing how many are needed and think one lot should suffice. Our advice would be to order not less than 50, if for only one tree, and have these sent in two or more shipments and four days apart. A grower cannot ship less in two shipments, and avoid mailing where possible as the express seems to get them through with more care in handling.

Where the Smyrna grower has his own capris he should use them every third day as long as they can be had. Another mistake is trying to buy capris in March and April to save the first crop Smyrnas, as this crop carries no staminate or pollen flowers and is useless. To buy figs to colonize capri trees the fall crop of September and October and the winter crop of March and April are most successful, and a capri tree should be at least five years old before an attempt to colonize it should be made, as trees younger than this seldom carry all the crops through the three crops. If one wants the summer crop for use in Smyrna trees it is well to get the spring capris for this purpose, and it is possible to perpetuate a colony therefrom.

ONE MAN OPERATES BOTH TRACTOR AND IMPLEMENT



More Speed-More Power-More Work

EVERY farmer who sees the new Moline-Universal Model D plowing is astonished at its speed, the splendid quality of work and the ease at which it operates. After seeing the Moline-Universal work, you will realize that the number of plows pulled is less important than the amount of work accomplished.

Great Capacity for Work

Speed, power and light weight are combined in the new Moline-Universal tractor to a remarkable degree. As a result, under any ordinary plowing conditions, the Moline-Universal pulling 2 plows at 3½ m.p.h. will plow 9 acres in a 10-hour day—equal to a 3-plow tractor traveling 2¼ m.p.h., the usual tractor speed. Thus the Moline-Universal gives you large capacity for heavy work, ample power for all belt work on the average farm, with these distinct advantages over other tractors—light weight; greater economy and ease of operation; ability to do all farm work, including cultivating, and ONE-MAN control of both tractor and implement from the seat of the implement, where he must sit in order to do good work.

Does Better Plowing

An advantage of speed plowing is the better quality of the work. With properly shaped moldboards and the Moline-Universal tractor plowing at 3½ m.p.h. the soil is more thoroughly pulverized and compacted than at slower speeds. It is left in such a level and fine condition that furrow marks are hard to distinguish.

Positive Reliability

And keep this in mind always—the Moline-Universal is built for positive reliability. The powerful 4-cylinder, overhead-valve, vibrationless engine delivers full 9 h.p. at drawbar and 18 h.p. on belt; unusually large bearings lubricated under 35 lbs. pressure; Remy electric starting, lighting and ignition system with governor generator; all moving parts completely enclosed; 15 Hyatt roller bearings; 5 adjustable ball thrust bearings; 7 splined shafts; differential lock; heat treated and steel cut gears—these give "positive reliability," and make the new Moline-Universal the best tractor money can buy.

Self Starter and Electric Lights

Self starter relieves the back breaking strain of cranking, makes tractor operation easy for non-robust help. In fact, many women and boys are successfully running Moline-Universal tractors. The self starter is a feature every overator will appreciate. Electric lights increase the working capacity of the Moline-Universal so that you can use the tractor night and day in the busy season. It gives you an emergency power always available to make up for any unavoidable delays.

Free Tractor Catalog

Your copy of our new tractor catalog which completely describes the Moline-Universal Model D is now ready. A postal will bring it to you, also the name of your nearest dealer. Address Dept. 49.

Manufacturers of Quality Farm Implements Since 1865.

MOLINE
UNIVERSAL TRACTOR
It Solves The Farm Help Problem

Ornamental Planting Calendar for July in Northern California

Written for California Cultivator By A. R. Gould

MUCH of the work this month in this department will be in the nature of staking the taller subjects such as hollyhocks, Canterbury bells, campanula and C. pyramidalis, cosmos, Michaelmas daisy, or hardy aster, chrysanthemums, dahlias, etc. If these are tied up neatly they will repay for any extra care. Besides constant watering, the hoe must be kept busy. There will also be bugs to deal with, and they must be kept down. A few seeds of the spring flowering subjects may now be collected from such subjects as primula polyantha, wallflower, pansy and viola, double daisy, myosotis, Arabis and allyssum, and these may of course be sown in well prepared soil in boxes for planting out in a month or two to supply an extended display in the coming spring season.

Begonias

The more common bedding types such as semperflorens, Vernon, Fairy Queen, etc., will just now be coming into flower, and should any of our readers not have planted the more fancy or tuberous types, which revel in a shady position, you can usually secure pot plants for this purpose from your nurseryman. Furthermore, they make nice subjects for a porch window box or for the table as specimens, and if they are to be grown all the time in pots they will need a little extra fertilizer or liquid manure water once a week. Those of the tuberous type may be kept from year to year and the semperflorens, or fibrous type, are propagated by root division and cuttings and also held over or they may be left in the ground, at least the older root clumps.

Snapdragons

These very popular flowers will now be providing a grand display, and it is not at all unlikely that they will be showing signs of rust, that terrible fungus disease which will usually be found on the underside of the leaves and stems. If the attack is very severe it may kill the plants before their full flowering period is over. In fact it is oftentimes only a matter of three or four days after the red rust-colored spores have developed and are ready to be carried around by the wind that the plants fall a prey to the disease. Once the disease spots have become distinct it is very little use to spray, and spraying will only prove a preventive measure in the very early stages of the growth of the plant, and then Bordeaux mixture or a sulphur fungicide should be used several times before the flowering season. Strictly speaking the snapdragon is a perennial, but owing to this disease it can only be grown as an annual. They usually provide a splendid color display and bloom profusely for several weeks and they are well worth growing. A weekly watering with liquid manure will be of great help to the plants this month, and the taller growing types should be staked.

Dahlias

It will be a good plan to disbud many of these, that is, remove the two buds on either side of the main terminal bud on each shoot. This will give larger flowers. A mulching with manure or leaves placed around the roots will be of very great benefit and will save quite a little watering. The small black fly has been troubling the dahlias this season extensively, and this should be frequently sprayed with nicotine solution Black leaf 40.

Roses

Keep the dead blooms cut off, and any plants showing signs of rose rust should be severely pruned and all the infected leaves burned. None should be left on the rose bed as the spores will infect all young growth. A certain amount of mildew may also be prevalent and a sulphur solution such as Qua-Sul should be used as a spray. Many of the more vigorous growing varieties may be cut back and a late supply of blooms will result.

Primulas

Primulas of the type of P. malacoides, a small free flowering pink variety, and P. obconica in various colors are very satisfactory grown either in pots as house plants or for window boxes, or they are equally good for the sheltered flower border. Sow the seed of these now in pots or boxes, on well prepared sandy soil, keep shaded and fairly moist. P. vulgaris, the English primrose, and P. polyantha and P. veris may also be sown as above.

Cineraria

These shade loving flowers may be secured in tall and dwarf types and are of various colors. A sowing may now be made in a box of soil which should be made up chiefly of leaf soil and sand.

Lawns

Any weeds appearing should be removed immediately as once they get hold they soon spread. Keep well supplied with water.

VEGETABLE PLANTING CALENDAR FOR JULY IN NORTHERN CALIFORNIA

Written for California Cultivator By A. R. Gould

ALTHOUGH it is getting late in the season for very extensive planting and will not be practical to take in much more idle land to plant this year, owing to the fact that it would need too much water to get it into shape, there is no need to slack up on production. The need for war gardens is still great, and all the ground which has been brought under cultivation should be intensively cropped, and as soon as one crop is off another should be under way. Never allow the weeds or pea tops to occupy the plots. Remove them and follow up with more beets, turnips or carrots. The keen gardener will always be thinking ahead and will thus keep busy. It meant much hard labor to prepare the plots, and it now only needs a little careful manipulation to keep the machinery in running order. Uncle Sam requires the help of every one in food production, and there is lots of land to spare.

Beans

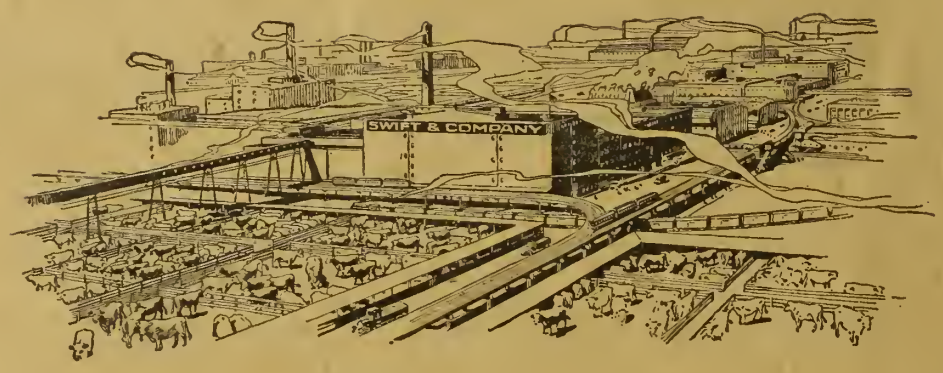
You can still sow those mentioned last month and include that now popular small white Tepary which is just the bean for a dry situation. The yield will repay many times over.

Cabbage and Cauliflower

Seeds of Autumn King and Savoy, the best varieties for winter use, may now be sown in boxes of well prepared soil or on a border. Sow sparingly in rows or broadcast. Cauliflower sown last month should be ready towards the end of the month to plant out nine inches apart in rows which should be 18 inches apart. Supply these with plenty of water.

Corn

It is not too late even yet to sow more corn. It will prove a welcome



A business that is as big as its job

KEEPING a nation of over 100 million people regularly supplied with meat and meat products is a big and complex job.

And a still bigger job when to it is added the needs of the American soldier here and in Europe and of the Allies as well.

It is a job of converting the live stock of the West into meat and meat products and distributing them in perfect condition over long distances to the consuming centers —the North, South, East, West and abroad.

A job of supplying with *unfailing regularity* products that in the main are perishable, in the exact qualities and quantities needed, to the smallest out-of-the-way village as well as to complex and congested metropolitan centers.

Only organizations like that of Swift & Company, with its highly-specialized methods of meat-dressing, its hundreds of branch-distributing houses, and its thousands of refrigerator cars, could have handled such a job efficiently and at a minimum of expense in the present war emergency.

Today American meat and meat products are the recognized standard of the world.

And the economy with which these products are produced is indicated by the fact that today the meat of a steer, dressed, is sold for less than the cost of the steer on the hoof! The proceeds of by-products, made out of what once was waste, have made this possible.

The size of the job has dictated the size of America's packing industry. And America's packing industry has proved itself to be equal to its job.

Swift & Company, U. S. A.

A nation-wide organization with more than 20,000 stockholders

crop and will come in succession. Sow the variety Golden Cream. That destructive moth which lays the eggs from which are produced the corn worm will be busy again in many districts. It destroys the top of many fine cobs of corn. The moths may be trapped by placing a tray of vinegar and molasses amongst the corn. The victims should be frequently removed.

Lettuce

Keep a successional sowing and never let these suffer for want of water. California Cream Butter is excellent for fall use.

Kale and Brussels Sprouts

Sow the Tall Green Kale and Aigburth Sprouts on a semishaded border, and during the month have the plot well prepared. It will pay the poultry keeper to raise a considerable quantity of kale for green feed.

Peppers

Plants of the large Bell or Bull Nose variety may be secured from the seedsman and planted without delay.

Turnips

Those sown last month will need drastic thinning out, leaving them four to six inches apart. Keep the hoe moving throughout and keep well supplied with water to insure quick growth.

Call for War Workers

THE Y. M. C. A. has need for 4000 workers, men and women, who are above the draft age, for service in France in order to keep pace with the rapid expansion of the nation's military establishment and to satisfy the demands upon the organization for workers in the French and Italian armies. The national war work council has undertaken a comprehensive campaign to secure these workers. The winning of the war will be delayed with a consequent increase in the loss of life and drain upon our natural resources unless we can secure the services of these men to care for our soldier boys.

Appeals for volunteers are intended primarily for the man who feels that he belongs to the "skipped generation," the man whose father gave his all a half a century ago and whose sons are now fighting on the western front. Dr. John R. Mott, general secretary of the national war work council, who has recently returned from France, declares that there have never been such opportunities for the middle-aged man to render patriotic service as are offered by the work which has been intrusted to the organization whose emblem is the red triangle.

Some of the biggest men in the United States are now working enthusiastically in France at what they would have considered small jobs a year ago. "These men," said Dr. Mott, "must have many, many companions before this war is won. In fact, we ought to recruit 2200 before July 1, and 1000 a month in July and August merely to do the work that is now presented to us. After that, no one can tell what the needs will be.

"We need all kinds of men. The post exchange business, which General Pershing has intrusted to us, presents opportunities for skilled executives, transportation experts, accountants, clerks of all kinds, warehousemen and the like. In our motor transport service we need automobile drivers and mechanics. This branch of the work should be especially attractive to the man who owns his car and can drive it and make minor repairs. Athletic directors are most important. The relaxation which they provide for war weary troops has a value which cannot be estimated. Hundreds of men who can direct mass play are needed today in France and Italy.

"It is not fair to ask the workers who are now bearing the burden to carry the load alone. Secretaries serving alone at the front are breaking under the terrific strain. They should be relieved as soon as possible. We here in the United States must settle down to the belief that this is going to be a long war. Therefore, we must have a great reserve force of workers to be prepared for any contingency. We who are too old to fight should deserve to be called slackers if we fail in this obvious duty."

On this basis the Y. M. C. A. is prepared to wage a campaign that will have its units in every state, every county and every community in the United States.

Care in Threshing Will Save Grain

Waste of grain through inefficient operation of threshing machines, though not serious to the individual farmer, may take millions of bushels from the nation as a whole and from the nations that are looking to us for food to ward off famine.

To point out ways in which such losses may be reduced the United States department of agriculture has issued Farmers' Bulletin 991, "The Efficient Operation of Threshing Machines." Copies of the bulletin will be sent free on request to the department.

If the threshing machines used in this country wasted only three or four bushels of grain out of every thousand they threshed, the loss of wheat alone in the United States every year would equal a quantity sufficient to furnish a normal supply of bread to a million people for nearly six months.

"How's your garden?" one Wheatridge man asked another. "House your chickens," was the courteous and earnest reply.—Denver Field and Farm.

Speed up with Electric Power

"Production and Not Acreage is the Measure of Profit"

HERE are some of the ways in which modern industry has been speeded up by putting electric power to work in the right place.

Metal mines have boosted output to meet world-wide demands. Great central power plants in place of small local plants in coal mining areas now supply cheaper electric power per ton output for each mine. All tonnage records have been smashed in the steel industry. Greater automobile output has lowered prices and given better road transportation. More and better cloth has been produced at lower power costs.

Through the use of electric motors many farmers are also securing the high production obtained in the big manufacturing industries.

Over 200,000 H.P. in G-E motors is now at work in this way on the Pacific coast.

2500 G-E Motor Agents throughout the country are ready to help you reap the benefits of doing your work the electrical way.

July Vegetable Garden in Southern California

Written for California Cultivator By D. F. Reichard

JULY is the month when the vegetable garden repays its owner for the care he has given it the last few months. Get the full benefit of your garden by gathering stuff when it is at its prime. Pick the string beans while they are tender, the green corn before it gets too hard; pull the root crops, carrots, turnips, beets, radishes and the like while they are crisp and tender.

If there are more vegetables than can be economically consumed sell or give them to your neighbors, or can or dry all that is practical for winter use. The important thing is to harvest the various vegetables when they are at their prime. In the case of most vining vegetables such as melons, cucumbers, beans and squash, the plants keep producing more and better crops after the matured fruits are harvested.

There are crops, however, that will leave the ground idle when they are harvested. These spaces must not be left long, for it is the patriotic duty of everyone with a piece of ground and enough water to put and keep it in tillable condition to produce something. California can produce millions of dollars worth of edibles in her fall vegetable gardens. Whatever can be produced at home for home consumption is that much released to go on to our boys who are giving their all that this world shall be a decent place in which to live.

There are advantages in planting fall gardens. The weeds do not grow as freely as in the spring; there are fewer insect attacks and the stuff comes in ready to harvest when vegetables in general, and summer vegetables in particular, are scarce and prices high.

The all important thing about planting during July and the few following months is to get enough water into the ground to get a proper seed bed. The best way to attain this is to thoroughly soak the soil before spading or plowing, and pulverizing. If the ground is free of trash and refuse it may be planted directly after this one working while the moisture is still at the surface. Should there be considerable roughage the plot should lie for a few weeks after working to allow the trash to decay. By that time the ground will have to be soaked again, worked up and thoroughly pulverized. Sow the seed and set out plants as soon as possible, while the soil is still moist on top. All seed should be planted deeper during summer months than at other times on account of the surface soil drying out so rapidly. Such small seeds as lettuce, carrots and turnips will give best results if planted from one to one and a half inches.

Practically everything in the garden line can be planted during the early part of July, but it must be kept constantly in mind that great evaporation is continually going on, and moisture must be supplied by frequent irrigations. Where peas and beans have been harvested and the vines taken out, replant with root crops or corn, either sweet or field varieties. Where root crops have been taken out replantings of Limas and Snap beans should be made. This arrangement is for rotation purposes to keep your soil in good condition. Other vegetables that are seasonable for early July planting in open warm valleys are muskmelons, casabas, watermelons, cucumbers, squashes and pumpkins. The latter part of the month potatoes may be planted for the fall crop.

PLANTING CALENDAR FOR JULY IN SOUTHERN CALIFORNIA

Written for California Cultivator

THIS is the season when closest attention must be paid to irrigation. The lawn browns up, and that finest of lawn grasses, blue grass, and white clover are in danger. Bermuda, which is hardy under almost all conditions, will continue to thrive under neglect. A dressing of finely ground bone meal at this period of the year, washed into the roots, helps wonderfully in greening up the lawn. The weeds are putting in their best efforts to gather as much moisture as possible.

Insect pests are hatching as never before, and liberal use of the spray pump will save many a plant.

Keep plenty of water on the dahlias. They are showing a wonderful bloom this year. The season has been very favorable.

An application of stable manure on the surface around the gladiolus will increase the size of the bloom. Glads are becoming more and more a favorite. If there are any bulbs of the glads which have not been planted they should be put in the ground as soon as possible; they are losing vitality for every day kept out this late in the season. Cannas in some of the newer varieties are most persistent bloomers and are wonderfully beautiful. Iris are now in their resting season, and during the next two months is the proper time of the year for dividing and resetting or for securing new varieties.

Presumably all the narcissus have been taken from the ground, and the bulbs are curing for the fall plantng, but one variety, the Campernelle, which blooms in the fall, should be planted soon. The spading of well rotted manure will prepare the ground for spring varieties.

Continue to plant seeds of annuals; they will afford bloom after the chrysanthemums are gone. Plant pansy, stocks, Canterbury bells, cosmos, candytuft, gaillardia, phlox, petunias, scabiosa, etc.

The seed of eucalyptus may well be planted now and then to afford a tree to fill in the woodlot or for ornamental purposes in various out-of-the-way nooks. Seed planted at this time will afford a tree ready for spring planting.

Sulphur the roses. Mildew is encouraged by the foggy weather which has been more plentiful than usual. Scatter the sulphur in early morning when leaves are moist. Late in the month it may be well to withhold water until all growth is stopped and even until some of the more recent growth is shrivelled. If kept in that condition, then heavily pruned, a wealth of Christmas bloom may be secured.

PLANTING CALENDAR FOR ARIZONA

As issued by immigration commission of Maricopa County:

Vegetable Seeds: Beets, cabbage and cauliflower in a shaded bed, casaba, corn, pumpkin, squash and Kentucky Wonder beans.

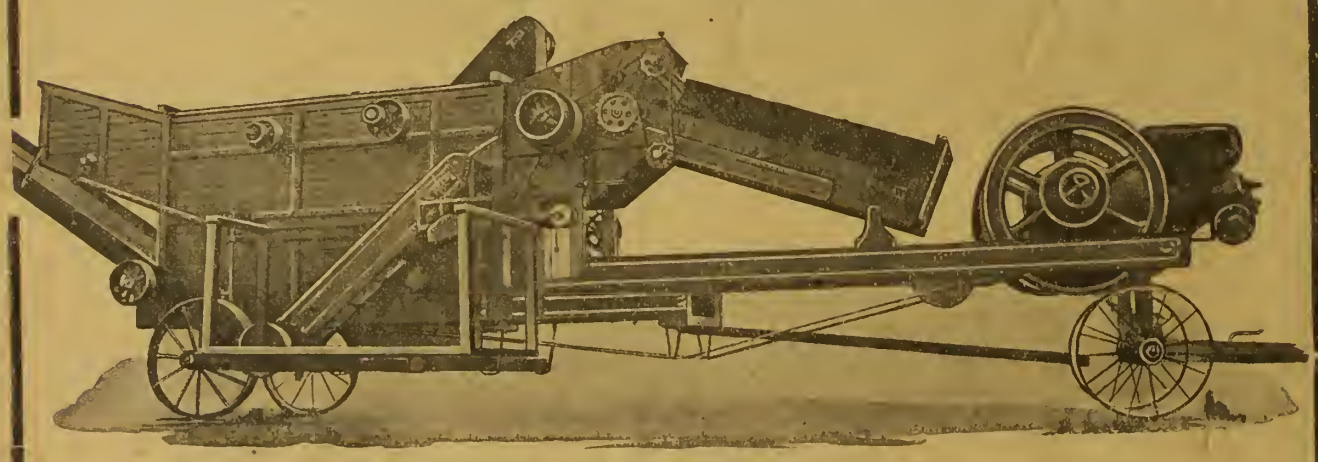
Flower Seeds: Cosmos and zinnia.

Field Seeds: Bermuda grass, cowpeas, corn, pink beans, milo, millet, sorghums, feterita, kaffir and Sudan grass.

We harvest cowpeas, alfalfa, tomatoes, melons, cucumbers, grapes, figs, plums, peaches, apples and pears.

New Labor Saving Bean Threshers

Seven men can operate the Junior No. 1, equipped with sacking platform for threshing from windrows—the most successful and economical Bean Thresher offered to California growers, threshing every variety.



For 22 years we have been making Bean Threshers in Ventura County. Our experience in hundreds of bean fields with the many machines we have built and sold has given us unlimited opportunity to observe and build bean threshers that meet every requirement.

To meet the demand for a bean thresher that could be operated with a minimum of labor, we have produced the Junior Nos. 1 and 2, two sizes of our special models that can be drawn across the field by a small tractor or horse power and operated by gas engine mounted as shown here. This machine can be operated as a stationary machine also. Seven men can operate this machine successfully, thereby SAVING THE EXPENSE OF HAULING THE BEANS TO THE MACHINE. It is built on the same principles as our larger machines and works just as satisfactorily, threshing every variety of beans.

Write us for information about BEAN THRESHING MACHINERY, telling us your acreage, what kind of beans you have, what horsepower engine or tractor you have, what kind of engine and tractor, and the amount per day you would like to thresh and we will furnish you, free, information as to your most economical and satisfactory requirements. Do not waste a valuable bean crop by trying to thresh beans with a machine intended to do other work. It will pay you to investigate our line and to buy without depending upon freight shipments from the East and where parts can be obtained quickly.

The Answer to the Farm Labor Shortage

THE farm labor situation is serious. And little relief is in sight. The new draft will take more men. More horses and mules must go. But, in the face of these handicaps *production must be increased*—and it can be if you adopt the right means.

The Cleveland Tractor has shown the way on thousands of farms. It has successfully replaced muscle with machinery. It has proved itself the modern "Man-of-all-Work."

The Cleveland Tractor plows as much ground as *three* good 3-horse teams and three men—eight to ten acres a day.

It actually does the work *better*. And it harrows. It plants. It reaps. It cuts ensilage, fills silos, turns saws, hauls manure spreaders and road machinery, drags logs, and does the hundred and one chores that mechanical power can do about the farm. It delivers 12 horsepower at the drawbar and 20 horsepower at the pulley. But it weighs less than 3200 pounds. The

Cleveland Tractor

travels on its own tracks, like the giant "tanks" on the battlefields of Europe, and will go practically anywhere. With 600 square inches of traction surface constantly on the ground, it goes through mud, sand, clay and gumbo without miring, floundering or packing the soil.

It steers easily—by the power of its own engine,—and will turn in a twelve-foot circle. It is so small that it can readily be operated under and among small fruit trees. It requires less housing space than a horse.

Rollin H. White, the well-known engineer, designed the Cleveland Tractor. It is built under his supervision—from the best materials. Gears and tracks are protected from dirt and mud, and are specially built for long service.

Let this modern "Man-of-all-Work" fill the gaps on *your* farm. Let it help you produce larger crops, with less help—and incidentally make greater profits for you. Write us now for detailed information and the name of the nearest Cleveland dealer.

who have purchased sons of our great herd sire

Prince Gelsche Walker Korndyke

Many dairymen have visited our farm and selected young bulls to head their herds, keeping us sold right down to youngsters all the time.

Wouldn't it be a good thing for you to come and see what we have to offer, and find out on what liberal terms we will sell you a splendid young bull?

Remember that these bulls are sure to increase very rapidly in value just as soon as we have official testing of their sisters under way, which will be within the next few months, and it is to your interest and financial advantage to buy now and be in position to benefit through our work.

King Korndyke Pontiac

is shown below. One of his sons sold for $6500 last December, and he is getting a wonderful lot of calves in our herd at present.

JANE GARDEN FARM

SACRAMENTO — CALIF.

FRED W. KIESEL, PROP'R. C.W. YOUNG, SUP'T.

King Korndyke Pontiac 20th

is the only bull in service in California that has for a dam a heifer that made above 36 pounds butter in seven days and above 1100 pounds in one year.

Her wonderful production is no more than might be expected from her breeding, for she is a daughter of Prince Gelsche Walker and De Kol of Valley Mead 2nd, who formerly held the world's record for two years production of butter by a helfer.

The sire of King Korndyke Pontiac 20th is King Korndyke Pontiac, conceded to be the best individual son of King of the Pontiacs in the west, and he is out of a half sister to Prince Gelsche Walker.

Keep your eye on this breeding in our herd as well as others, and make up your mind early to have a son of this great young sire.

At present we have only a few young bulls on hand, sired by Prince Riverside Walker, our senior herd sire. Visit us or write your needs.

Glenn County Pig Club Contest

Written for California Cultivator By W. H. Heileman

EIGHT boys from the Willows and Orland high schools started in a pig feeding contest some four months ago. The rules of the contest required that each boy feed at least two pigs to market size and that he keep record of all feed and keep track of the cost of feed, labor and other incidentals connected with the production of pork. The contest ran four months, and the pigs at the close of the feeding period ranged from 6 to 7¾ months old.

Seven boys finished. The winner was Ernest Barceloux of Willows. He entered with two Berkshire pigs which averaged 52 pounds each and which were 3¼ months old. After four months' feeding the two pigs averaged 247 pounds each. The daily gain on his pigs was 1.62 pounds each. After figuring out the original cost of the pigs and the feed and labor entailed during the 120 days contest this boy had a net profit of $22.15 or $11.07 per pig.

Below are tables which show some of the facts and results in the contest:

The average age of the pigs at the close of the period was 7¼ months. The average weight at the start was 57 pounds and the average weight at the close was 222 pounds. The gain in weight per pig taking the entire period ranges from 102 pounds to 199 pounds, though each pig was fed the same length of time, namely four months.

In the above table the total cost of feed includes grain, alfalfa meal, concentrates, milk, and sometimes tankage. The total invested includes the cost of pigs on a pork basis when bought, labor, feed, and all that went into the pigs. The final value is what the pigs sold for, which was only the regular market on the date sold. It will be noted that in the profit column Long suffered a loss of $1.28 on his five pigs, or about 26 cents on each pig.

The above records in the main include some pretty careful feeding on the part of the boys. Most of them fed mixtures which included milo, rolled barley, or whole barley, tankage, alfalfa meal, and mill feeds. Nearly all the boys found a plentiful supply of skim milk or buttermilk for their pigs. Long had the least varied rations, his dry feed being largely milo maize and midlings.

For the 21 pigs in the contest the figures show that the average grain fed to each pig was 522 pounds. The average cost of grain fed to each pig was $15.45. The average pounds of grain to each pound of gain in live weight was 3.74. The average cost of making a pound of pork was 12.8 cents. The pigs show an average cost of $27.36 to the time of sale, and sold for an average price of $33.55 each. The average profit on each pig was $6.19.

Barceloux led by making a profit of 407 per cent on his original investment; Ray Shallooe made 33 per cent; Templeton 27.2 per cent; Hawkins

TABLE NO. 1

This table shows the number, age, weights, and gains for each boy's pigs, taken by lots.

Ed. Shallooe	547	14.33	3.72	.138	27.69	31.88	4.19
Ray Shallooe	547	14.33	3.05	.113	28.38	37.77	9.39

*Loss

21.6 per cent; Frost 15.4 per cent; and Ed Shallooe 15.1 per cent. Long lost one per cent on his investment.

On the basis of profit alone Barceloux has first place, Ray Shallooe second, and Templeton third. On the basis of total score which includes values with regard to weight and age, profit on investment, story, and record keeping, Barceloux has first, Ray Shallooe second, and Hawkins third.

It is interesting to note the reports made by the boys in the contest, as related to feeds.

Ernest Barceloux reports feeding 1300 pounds of ground milo which he had ground at Macy's mill in Orland. He hauled his grain from Willows to Orland, had it ground at 15 cents per hundred and returned it for feeding his pigs. His other feed was kitchen slops and waste, of which he reports feeding one and one-half gallons daily. He had grass for a while at first. He pastured his hogs two months, then used the dry lot. One of the Barceloux pigs came from the Anchorage Farm at Orland. This pig was six months old at the close of the contest and weighed 217 pounds. His weight at the start of the contest was 48 pounds.

Ray Shallooe had two pure bred Berkshire pigs, one coming from the Mills Orchard Corporation Farm and the other from the Butte City Ranch. Between January 20 and May 6 Ray fed immature milo (this milo was quite musty due to heating), and between May 6 and 13 he fed 100 pounds of whole barley which he first boiled. He brought his pigs back to the musty milo from May 13 to the close of the contest. He fed a total of 1539 pounds of milo, 100 pounds of boiled barley, and 229 gallons of skim milk during the contest. He used grass and weed pasture a portion of the time.

Merle Hawkins fed four grade Duroc pigs which he bought from his father. He says: "I found a man who had whole barley to sell and I bought it and had it ground and it cost me $2.25 per hundred. I fed six parts of barley, two of mids, and three of alfalfa meal. In the middle of the contest I weighed my pigs and found they had each gained 1½ pounds every day. I fed the same way for a month more when my barley ran out and I bought red milo which I used instead of barley."

Hawkins fed his four pigs 1183 pounds of ground barley, 546 pounds mids, 514 pounds of ground milo, 360 pounds of alfalfa meal, 33 pounds of tankage, five pounds charcoal, four pounds bonemeal, and four pounds of phosphate rock. He fed also 730 gallons buttermilk and 240 gallons skim milk.

Gwen Templeton fed two grade Duroc pigs which he bought from his father. He says in his report: "My hogs had no pasture and hardly any green feed at all. I always tried to keep my pigs so they had plenty of water. I weighed each month. I fed all my grain wet. The grain was not soaked in water but mixed in with the milk at feeding time." Templeton fed his two pigs 48 pounds mids, 55 pounds alfalfa meal, seven pounds barley, 17 pounds tankage, 107 pounds milo, 450 pounds of a mixed feed which cost three cents per pound, 2½ pounds charcoal, and four pounds of phosphate rock. He fed 300 gallons skim milk during the contest.

Ernest Frost fed two pure bred Berkshire pigs from the Mills Orchard Corporation. He says: "I fed my pigs milk first and let them drink all they wanted, then I mixed barley and milk together and gave them." Frost fed 960 pounds whole barley and 708 gallons of skim milk. With this he made 319 pounds of gain in pork.

Charles Long fed five pure bred Berkshire pigs. He states: "The pigs had ground milo in one section of a self-feeder and charcoal in another. They had this before them all the time. I fed them by hand twice a day some, ground milo, middlings, and a little cocoanut meal." Long fed 2370 pounds of milo, 720 pounds of middlings, 85 pounds cocoanut meal, 34 pounds charcoal, 33 pounds of tankage, and eight pounds of bone meal and phosphate rock. He used two pints of cresol to keep the pigs free from lice. He fed no milk or buttermilk.

REPELLENTS FOR PROTECTING ANIMALS

VARIOUS kinds of flies tend to injure cattle by weakening them and reducing their milk supply. It is fairly well established that the stable fly does considerable damage. The test experiments with dairy cows seem to indicate that the effect of flies on milk is not of great economic importance, although evidence seems to show that animals protected from flies feed better and are generally in better condition. Reduction in milk, some authorities believe, is due as much to the fact that cows do not graze as freely in the hot sun in summer as at other seasons.

There are excellent repellents prepared and sold on the market. Some prefer to prepare their own. For such we reprint from a former Cultivator the following:

In general the conclusions are that many of the substances, such as pyrethrum powder, camphor, citronella and sassafras, while temporary repellents, lose their effectiveness very shortly. Ten per cent solutions of the liquids in cottonseed oil, therefore, commonly have to be applied daily.

Various oils, emulsions of oils and mixtures of oils are used in repelling

Dutchland Sir

Pietertje Creamelle

Is a name that is becoming firmly entrenched in the story of high producing Holsteins in California.

By a grandson of the great transmitting cow Changelling, and out of a daughter of the former world's record cow Creamelle Vale, he is bred to great production and has already proven his worth with 18 A. R. O. daughters in our herd, records up to over 30 pounds butter in seven days.

We enjoy a steady sale of good bulls to dairymen, many of them coming back for their second and third bull. We believe we can fill your requirements in the bull line. Write us or visit our farm.

HOLSTEIN-FRIESIAN CATTLE

From my herd of 75 registered Holsteins, can spare ten yearling heifers and heifer calves splendidly bred, closely related to 30 and 40 pound cows.

One bull calf, whose eight tested nearest dams averaged 31 pounds weekly butter record.

One service bull from 29 pound dam. One hundred and two pounds milk one day. His two nearest dams through sire yearly record average 21,000 pounds milk and 812 pounds butter.

Write me for low prices and further information.

Registered Holsteins

Depth of body is a prime requisite in the high producing dairy cow, and is especially desirable when found in combination with other outward evidences of dairy quality. Great deep bodies are outstandingly characteristic in the offspring of

Merci Lad Korndyke Burke

our senior herd sire, who is by De Kol Hengerveld Burke and out of Winnie Korndyke Cornucopia De Kol, 31,034.1 pounds milk and 1201.00 pounds butter in one year. the first cow in California to produce that amount of butter in one year.
We have a few of his sons. out of good record dams, for sale.
Inquiries or orders by mail will receive careful and prompt attention.

SANTA ANITA RANCHO *Santa Anita, Cal.*
Anita M. Baldwin, Owner *W. H. Taylor Supt.*

Sons of Prince Alcartra Korndyke

are giving uniform satisfaction in a large number of herds whose owners were farsighted enough to secure a son of this great son of Tilly Alcartra and Korndyke Queen De Kol's Prince.

How about YOUR herd? Wouldn't a son of Prince Alcartra Korndyke work an improvement for you?

Korndyke Queen De Kol's Prince, sire of Prince Alcartra Korndyke, is famous not only because of his great list of 90 A. R. O. daughters and 21 proven sons, but also because of the great size and splendid type that are characteristic of his descendants through both sons and daughters.

Tilly Alcartra, dam of Prince Alcartra Korndyke, is without question the greatest dairy cow ever developed in any breed. She is the only cow on the Pacific Coast to make 40 pounds butter in seven days and she did it after five consecutive years of yearly test work. She is now making the best yearly record of her career, exceeding during her first five months her former world's record production.

Buy Your Next Herd Sire at

Hollywood

We offer two exceptional values at the present time in young bulls.

No. 1—Born February 15, 1918

Sire—KING KORNDYKE SADIE VALE, the only 40 pound bull that has a 40 pound daughter.

Dam—S. V. H. ALTOANA ORMSBY, a daughter of Sir Veeman Hengerveld. She made 16.70 pounds butter in seven days as a three year old right after being unloaded from the cars from the east and is capable of a much larger record.
This young fellow is a splendid individual, three-quarters white, and is a splendid buy at the PRICE $500.00.

No. 2—Born May 9, 1918

Sire—HOLLYWOOD PIETERTJE KORNDYKE, who is by Hollywood Lilith Palmyra, 11 A. R. O. daughters including a 33.44 pound three year old, and out of Pietertje Korndyke Abbekerk, 712.9 pounds milk and 35.30 pounds butter in seven days, 3235.8 pounds milk and 141.6 pounds butter in 30 days, 9300 pounds milk and 375.0 pounds butter in 90 days. As a senior four year old she made 23,874.2 pounds milk and 984.83 pounds butter in one year, and she is a granddaughter of Pontiac Korndyke.

Dam—PIETERTJE HENGERVELD CREAMELLE, 621.5 pounds milk and 30.24 pounds butter in seven days, 2648.7 pounds milk and 124.18 pounds butter in 30 days, 16,633.8 pounds milk and 691.56 pounds butter in 305 days.
The dam and sire's dam of this calf average:

Milk seven days	667.10
Butter seven days	32.77
Milk 30 days	2,942.20
Butter 30 days	132.89
Milk one year	20,254.00
Butter	838.19

(Average of yearly records includes the 305-day record of his dam and the four year old record of his sire's dam.)

This choice young fellow is about two-thirds black, and his breeding on both sides is unexcelled. We recommend this buy as a sure money maker. He will not be here long at the price, $500.

flies. Crude petroleum, cottonseed oil, fish or train oil, and light coal-tar oil may be used pure.

Jensen (1909) recommends the followiug formula, which is said to protect cows for a week: Common laundry soap, one pound; water, four gallons; crude petroleum, one gallon; powdered naphthalin, four ounces.

Cut the soap into thin shavings and dissolve in water by the aid of heat; dissolve the naphthalin in the crude oil; mix the two solutions, put them into an old dasher churn and mix thoroughly for fifteen minutes. The mixture should be applied once or twice a week with a brush. It must be stirred well before being used.

Fish oil is rated as one of the best repellents and has been used alone and in combination with various other substances. Other substances that have repellent qualities and that have been used in various mixtures are pine tar, oil of tar, crude carbolic acid, oil of pennyroyal and kerosene. The protective action of fish oil is stated to range from less than two days to six days. Moore's formula is said to protect for two days. This mixture is safe when applied lightly with a brush, but not when applied liberally with a pail spray pump. The formula is as follows: Fish oil, 100 parts; oil of tar, 50 parts; crude carbolic acid, one part.

Laurel oil is a very effective repellent. Mayer found that the protection lasted from two to twelve days. The oil when used pure has an irritating effect unless it is applied lightly. According to Mayer, the irritating effect may be overcome by combining it with linseed oil in the proportion of one to teu. In the experiments of the department of agriculture it was found that teu per cent of laurel oil in cottonseed oil was active for less than a day.

A number of formulas for repellents for application to wounds have been recommended by various authors.

In experimental tests carried out by the department the following results were obtained:

A ten per cent mixture of crude carbolic acid (21.8 per cent phenols) in cottonseed oil has a very strong repellent action on flies, but this lasts less than a day, in consequence of which it is necessary to apply the mixture every day. The mixture should be applied lightly with a brush, since a heavy application with a spray pump is likely to cause phenol poisoning.

Mixtures consisting of 10, 20 and 50 per cent of pine tar in cottonseed oil have marked repellent qualities. They should be applied lightly and it is necessary to apply them every day. A liberal application of a ten per cent mixture is deleterious to animals.

Herd Sire, Dairy King of Arizona

CHOICE BREEDING STOCK FOR SALE

A. MACMINN

Phoenix ***Ariz.***

owned by J. H. Meyer who has been for some months maintaining a small herd on his Monterey County ranch. Most of these recently received animals have been sired by one of the greatest of the Ayrshire breed, Finlayston, a bull which has to his credit 90 A. R. records; others were sired by Baron's Best of Bargenoch, who has 11 A. R. daughters to his credit, each averaging over 10,000 pounds of milk testing over four per cent. Some of the new purchases were direct importations from Scotland.

If we sell our cows this year we will be confronted with the hardest kind of a task when we want to replace them. Good cows have been scarce for a number of years. I believe that we have not reached the highest point when it comes to prices to be paid for good dairy cattle. Rather than sell our cows we can afford to buy feed even at a temporary loss. The situation is full of hope and promise to those who are willing to learn the lesson which the present crisis teaches.—Hoard's Dairyman.

In the Northwest a large number of herds of registered dairy cattle are now under federal test and supervision for tuberculosis. One or two of the big breeders, notably Hollywood Farm and Carnation Stock Farm, took the initiative in this matter

Field Notes from the Live Stock Men

Ormsby Segis Marie, the great world's record heifer, and the other bunch of choice registered Holstein females purchased by Toyon Farm Association, San Jose, at J. H. Hulbert's sale at Mount Vernon, Washington, arrived at Toyon Farm in first class condition. They were brought down by Charles Mac Donald, under whose care Marie made her world's record, and who has now taken charge of the Toyon herd. All of the females except one are due to freshen between July and November, and there may be expected some good records from these show quality females.

Carnation King Sylvia

This is the $106,000 registered bull calf brought to the Pacific Coast by the Carnation people.

K. P. Tola Joe, Gotshall & Magruder's state record daughter of King of the Pontiacs, is now at Tulare Holstein Farm where she will be bred to W. J. Higdon's $6500 bull King Korndyke Pontiac 20th. The calf from this mating will be worth a small fortune, bull or heifer.

Present labor conditions are trying the souls of dairymen who operate on a scale that requires the employment of a number of men, but at no time in our history have conditions in the dairy business and in the breeding of registered dairy cattle been so favorable for the owner who does his own work, possibly with the aid of other members of the family. Investment in registered dairy cattle right now to the limit of carrying capacity looks like as wise a one as can be made, for when the certain scramble for cattle comes a little later on the man who owns good cattle will be able to sell them for well advanced prices.

The Lewis Company reports a sale from its Hollister herd of registered Holsteins to F. M. (Borax) Smith for the herd maintained on Sorosis Farm, Santa Clara County. The bull, Prince Ambro Skylark Ormsby, is an excellent young son of Sir Skylard Ormsby Hengerveld, whose daughters have made a remarkable showing. Mr. Abernathy, who handles the extensive operations of Sorosis Farm, is an enthusiastic Holstein man and is gradually breeding up an excellent herd.

Toyon Farm Association of San Jose reports the sale to Bohnett Brothers of Santa Clara County, of a high class bull calf sired by their herd sire, Finderne Soldene Valdessa and out of Tulista Johanna Princess, a three year old of great quality, with a record of 27.91 pounds for seven days, 98.60 pounds of milk in one day and over 100 pounds of butter for 30 days. Bohnett Brothers have been successful dairy men for many years and have been known as scientific farmers in all different departments. They are just starting their first official testing work with pure breds. The good foundation cow Nordica Queen, with a present record in excess of 25 pounds, is now on test and looks promising for an increased record.

For Calf Scours

B-K treatment is saving many calves. Scouring calves indicate a germ infection that is likely to run through your entire herd with serious losses.

The loss of one calf is bad enough, but nothing compared to your loss when the infection spreads—as it will unless checked. Then your year's work in building up your herd is wasted—your profits lost.

Leading breeders testify that B-K stops scours. It is powerful in killing germs. When used internally B-K kills the germs in the mouth, throat and digestive tract, heals inflamed membranes, relieves irritation. B-K may be given freely in drinking water.

If your dealer does not have B-K, send us his name.

FREE BULLETINS: Send for complete information—"Special trial offer" and our calf bulletin No. 136.

Northern California Notes

Written for California Cultivator By W. S. Guilford

CONDITIONS IN GENERAL

GRAIN harvest is well under way in the Sacramento Valley and the crop is very spotted, both as to quality and yield. There is considerable speculation as to price; a few lots have changed hands at around $2.25 per hundred for barley but most producers are of the opinion that the price will be higher and that they will hold until fall if necessary before selling.

During the early part of June we have had some very hot weather. This has been good for the rice and very favorable for the spread of red spider. This pest has already defoliated some trees, and at the rate it is multiplying it looks as if it would be difficult to keep it in check even where spraying was started early. At Butte City Ranch, at the Monroeville Orchard and at the Moody and Burton Orchard dry sulphur was sprinkled in the crotches of the prune trees and on the ground before any spider could be found on the trees. This was followed by a thorough spraying with atomic sulphur early in June as soon as the hot weather started and as soon as there was any sign of spider. This first spraying is being followed immediately by a second, and spraying will undoubtedly be a continuous operation all summer.

MORE IRRIGATION NEEDED

The need of more irrigation facilities, more storage particularly, is becoming more apparent as the season advances, and it will be more acute later. If this results in definite action in irrigation development it will be a benefit to the valley in the end.

A GREAT SHORTHORN HERD

A prominent Eastern breeder of Shorthorn cattle, Charles Saunders, has said: "No man ever bred good Shorthorn cattle, fed them well, and stayed with it in good times and bad, without making money."

This occurred to me on a recent visit to the Roselawn herd at Woodland. Tom Gibson's father started this herd of Shorthorns nearly 40 years ago. Dr. Elberg, the son-in-law representing the third generation, is a Shorthorn enthusiast and is constantly increasing the high standard of the herd. The cattle are kept in fine condition, the young animals grown out well, and the demand has been greater than could be supplied.

The cattle in this herd are a wonderfully thick meated lot, deep bodied, long and broad. Their business is to convert forage into high class meat, and they do this very efficiently.

Bulls from this herd have been factors in raising the standard of California range herds for many years, and the establishment is now a greater asset to California agriculture than ever. Every bull sold from this herd is a factor for increasing the wealth of the state.

We need a great many more herds of cattle in California like this at Roselawn.

MAKE SILO PLANS NOW

Although the price of building material is higher now than ever before this is the year when more new silos should be built than ever. We need to conserve every pound of feed for live stock in the best possible condition.

Don't delay buying or building the silo until too late in the fall. Get it finished in plenty of time before filling time.

Silos are no longer an experiment; that stage was passed years ago. It is possible to see almost any type of silo in nearly every county or community in the state. It will pay well to visit farms on which silos have been used one or more years, and get the ideas of those who have had actual experience.

GIVE YOUNG TREES PLENTY OF WATER

Many of the young trees planted this year will die for lack of water. Where plenty of irrigation water is available from streams or wells young trees will of course be all right, but on "dry land" plantings the moisture supply is short. Even where cultivation has been thorough additional water should be supplied. In most places it will be a good plan to keep the tank wagon running all summer.

Gerben Abbekerk Maid

Property of Stalder Brothers. At four years, ten months, 11 days produced in seven days 622.0 pounds milk, 30.101 butter. Thirty day record, five years, ten months, eight days, 3190.7 milk, 106.297 butter; at seven years, 15 days, 3037.5 milk, 138.316 butter.

TRUCKS MULTIPLY

A large tonnage of the grain and rice produced in the Sacramento Valley this year will be hauled by trucks and trailers. Because of their greater capacity and the speed with which crops can be hauled in this way they are hard competition for mule teams. Many farmers would be as much at a loss to do business now without tractors and trucks as they would without telephones.

PRODUCE CLEAN MILK

The man who produces unclean and filthy milk is especially unpatriotic. This milk, if sold for ready consumption, causes disease; if used for butter making it produces an inferior grade of butter; and if used for cheese making in all probability will produce cheese that will not keep.

While it is not possible for all farmers to produce a grade of milk similar to certified milk it is possible by a reasonable amount of care for all farmers to produce a high grade of milk.

The following are a few precautions that should be noted by every conscientious dairyman:

Cleanse milk pails and milking apparatus thoroughly after each milking.

Brush off cow before milking.

Milk with clean hands.

Do not allow any dust in barn during milking.

Remove milk from barn as soon as possible after milking.

Keep milk in a clean cool place.

Do not allow manure to collect around the barn door and in the corral.

Keep barn reasonably clean.

Do not sell milk from cows that have not been tested for tuberculosis.

W. E. Spangler, Colorado Agricultural College.

LEGHORN BREEDERS TO FORM ASSOCIATION

Written for California Cultivator By Cornele G. Ross

The Leghorn breeders of California are asked to meet at the Times Assembly rooms, Los Angeles, on Friday evening, July 12, at 8 p. m. to complete the formation of a state wide organization of all who are interested in this breed.

The aim of those who have started this movement is to bring together all who are interested in the Leghorn breed into a body that shall be representative of the most numerous breed in the state and to harmonize any apparent divergence in interests between the socalled "fanciers" and the owners of commercial flocks so that all may work for the improvement of the breed both as to standard of type and increased production of eggs.

We should get together for mutual interchange of ideas that will benefit the industry, institute and carry to a successful conclusion a campaign of education to demonstrate to our members, as well as the consuming public, that the lowly hen, (the Leghorn especially) can utilize by-products unfit for human food and turn out a product of the very highest nutritive value to expand our diminishing food supply.

We must educate the poultrymen to the necessity of improving his average egg yield and also show to the consuming public that the egg is still an economical food, even at the slightly advanced price which present feed costs make necessary.

Now, Poultrymen, it is up to you to turn out and see that this new body is properly launched, that it is officered by poultrymen covering the several poultry sections of our state, as well as representing all branches of the industry. Don't leave it to "the other fellow" this time but come yourself and give the added enthusiasm of your presence as well as the benefit of your knowledge and ideas.

POULTRY PRODUCERS WANTS MEMBERS

The report of the Poultry Producers, Inc., as of June 1, is interesting in a number of particulars, and especially in the hint at the conclusion of the letter of the manager, J. H. Barber, and the president, P. R. Lyding, that "there is a growing sentiment among our membership in favor of issuing such an ultimatum—that the outsiders must either come in and help the association or the association will quit—and it is not impossible that the choice may be offered to the outsiders and defaulting members sooner than they anticipate."

According to the report, it had been figured when the association was organized that it would have at least half of the egg shipments to San Francisco and would soon have enough to control that market. The results have not been as good as were anticipated in the matter of getting these shipments. Last month the association had about 37 per cent of the eggs which came to this market, and last year about 30 per cent. The increase corresponds quite closely to the increase in membership, but does not bring the percentage of eggs up to what was hoped for.

AMERICAN EGG LAYING CONTEST

By R. F. Palmer, Director, Leavenworth, Kansas

Broodiness affected the records of some individuals during May. A pen of white Leghorns from Washington broke our monthly record by laying a total of 144 eggs. White Leghorns, Black Leghorns, Anconas and Rhode Island Reds were the leaders in the order named in the breeders' contest for May. The record being made by the yearling hens is really surprising. These birds all made good records last year, but in spite of that fact the five highest pens of yearling hens laid from 133 to 138 eggs per pen for May. A number of hens made a perfect score of 31 eggs in the 31 days, and a few of the hens which have been among the high layers went broody and their lead is being cut down because of that fact. The Buff Leghorn pullets have made the highest average per bird for the seven months.

Picking the Slacker Hen

Written for California Cultivator By Jean A. Koethen

ALL yearling hens may be divided into three classes: Those that are vigorous and prolific enough to be fit for breeders; those that have proven themselves good layers but are deficient in size, color or some other quality demanded in breeders; those that are profitable neither as breeders nor layers. It sometimes happens that the best breeder in the pen is not the best layer. Undersized hens are often exceptional layers, but they should not be used in the breeding pen. The hen chosen as a breeder should be the best all-round hen, of good size for her breed, a good layer, as near standard qualifications in color and shape as possible, but above all things a vigorous bird. A hen that has suffered some illness and recovered may be a good layer for another year or more, but she must never be allowed in the breeding pen, for there is no certainty that her constitution has not been impaired by that one attack of indigestion or roup.

Our aim in culling the flock in the summer and fall is to segregate the hens into these three classes, and especially to get rid of the slackers, those that are keeping down the average of the flock and consuming grain they cannot pay for. June is not too early to begin to cull out the hens that are dropping off in production. The trapnest picks them with absolute certainty, but a good deal may be learned by observation. Notice the comb for one thing. As long as a hen carries a bright red comb she is laying. When the comb become shrunken and dull in color this may be taken as a sign that for the time being, at least, she has stopped. If this happens in June or July she may be spotted as an early molter and removed from the flock.

Some successful poultrymen still insist that the early molter may be pushed through the molt by careful feeding and made to produce well in the fall, but the concensus of opinion is that she is unprofitable. The color test which is in use at experiment stations is nothing more nor less than a molting test. The hen that has bright yellow legs and glossy plumage in the fall is the early molter. The late molter keeps right on laying while her sister molts and may still be ragged and faded as late at Thanksgiving.

But there are other ways of picking the slacker. She is the hen that hunts the roost while the others are still scratching; the one that dawdles in a corner at mealtime, and usually the one you will find on the roost with an empty crop. This last is a very good test, indeed. The prolific hen must be a large eater. If a hen, after being given the opportunity to fill her crop, still goes to roost with it empty something is wrong. Whether she is lacking in vigor or just simply lazy does not much matter. She is a slack-

Continued on Page 23

The Eggs You Didn't Get

How can you expect a hen to lay 150 eggs a year or even 50 eggs if her vitality is sapped by lice and mites—all she can do is itch and fret and cost you money.

DEVIL'S DUST

A Sure Killer of Vermin—safe and economical to use

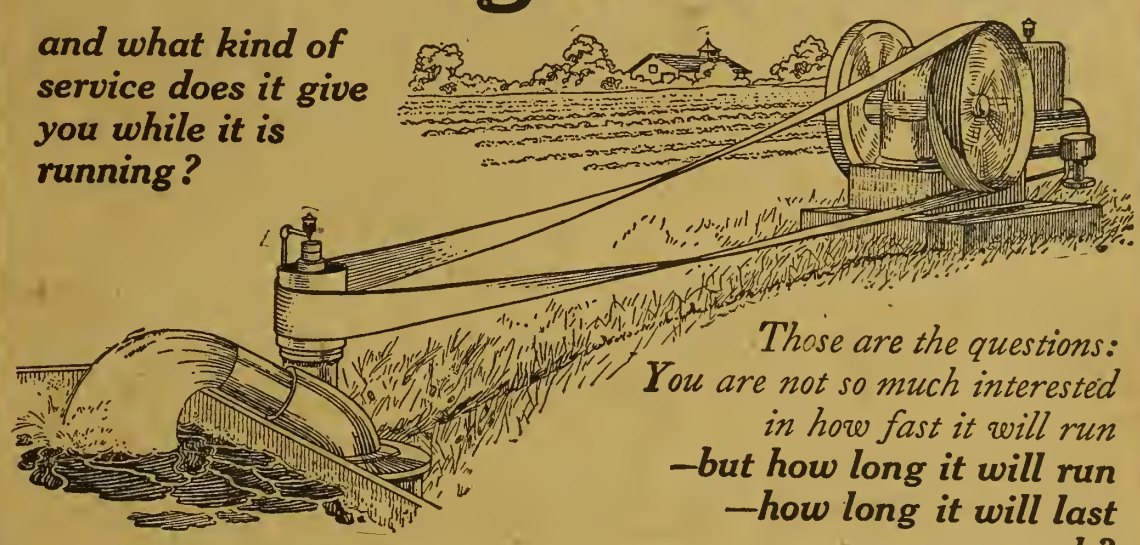
How long will it run?

and what kind of service does it give you while it is running?



Those are the questions: You are not so much interested in how fast it will run —but how long it will run —how long it will last on your work?

—Test Special Belts

—last and *run* and do their work well for years—it depends on the kind of work. Some belt users buy cheap belts made of short fibre cotton and shoddy rubber — *consequence:* ***they last a few months—maybe not a whole season.***

You can't throw money away faster than to buy that kind of a belt—besides, when it fails to do your work the need may be greatest. Buy a **Test Special** belt in the first place—***it lasts for years. Write us.***

BELT TROUBLES: Do you have any troubles with belts? We are belt engineers. Send us a rough drawing to indicate *how your belt is operated, and tell us your troubles. We'll cheerfully help you solve them—FREE.*

Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.

Liner rates: Single insertion 3c per word; yearly contracts 2½c per word; 35c per issue minimum charge.

TREES

For Sale to Nurserymen or Large Planters—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by July 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

For Sale — Extra fine Valencia trees, ⅝ to 1⅛, all sour root, high buds, very thrifty, clean and straight, not fertilized, excellent soil for balling, nothing better grown. Can supply a limited acreage yet closing out entire lot of these fine trees. S. R. Coate, 564 S. Los Angeles St., Anaheim, California. Phone, Anaheim Pacific 403-J.

Valencia Oranges and Eureka Lemon trees one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

For Sale — Choice, young, thrifty Citrus Trees. W. W. Burns, 631 Security Bldg., Los Angeles.

Citrus Trees — All kinds, any quantity. Butler's Morning Side Nursery, Lamanda Park, California.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

SEEDS AND PLANTS

Early Amber Sorghum makes the best silage and produces the greatest tonnage per acre. Recleaned seed 9c per pound f. o. b. Stockton. Fancy recleaned Sudan seed at 18c per pound f. o. b. Stockton, in lots to suit. Aurora Seed Mill, 48 N. Aurora St., Stockton, California.

Sudan Seed 17½c, Amber Cane 7½c, Feterita, Egyptian Wheat, Red and White Milo Maize. Hickory King Corn extra good. Dwarf White Milo Maize yields 21 sacks per acre. S. Peruvian Alfalfa. Box 501, Fowler, California.

Corn, Sorghum, Sudan Grass, Mangel beets and all other kinds of seeds. Immediate delivery. C. C. Morse & Co., 727 Front street, San Francisco.

Sudan Grass Seed, first quality. 17½c per pound. Wm. Ritchie, Arlington, California.

FARM LANDS FOR SALE

Attention Land Buyers!

Here's an excellent proposition: 40 acre farms selling for $15 to $25 per acre, long time payments, 6 per cent interest, in the best agricultural part of Snohomish County, where you have all the modern conveniences, paved roads, railways, schools, churches, mills and factories. This district has proven its worth by the many successful farmers now located there. We also have some beautiful water front 10 acre tracts. OPPORTUNITY knocks at every man's door ONCE, but believe me, it does not continue to knock forever nor does it pound the door down. For further information address the owners, BROWNELL LAND CO., 904 Third Ave., Seattle, Washington.

For Sale—Reader, here is a fine paying ranch. 20 acres, fine stand alfalfa and 5 acres 12 year old Navels and Valencias, a row of lemons, about 2 acres around the alfalfa on county property. All alfalfa sold in field at $20 per Hay Scales and binder cutting now. See it. Have 50 head Poland-China hogs. Will sell also if desired. J. Frank Bowen, 712 Grant Bldg., Los Angeles.

Retail Dairy with modern equipment. 30 select cows, fine 20 acre ranch, beautiful 11 room house, barns, silos, pumping plant and many other things to go with the ranch. ½ mile from high and grammar school. Los Angeles suburb. Address V, Care Cultivator.

20 acres deep silt land, joining good town on the South; 10 a alfalfa, 10 a grain; 300 feet to railroad station. Plenty of water for irrigating. Soft water piped on place. Price right. Chas. McNeely, Alpaugh, California.

Attention—Poultrymen — Modern (stocked) plant, small orchard, bungalow home; all conveniences. Big income producer. $1500 will handle. Will bear investigation, write for particulars. George Ellison, Campbell, California.

Be Patriotic. Raise Stock on productive government land, plainly marked on county sectional maps. $2.50 ANY county. Booklet, particulars for stamps. Write Joseph Clark, Sacramento.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Best Peach

Have an old peach orchard (irrigated) which I wish to reset, and desire to know which two varieties of clings and which two varieties of freestone peaches to plant, bearing in mind the highest qaulity of a peach, the surest bearing for every year, healthiest trees and trees that require the least labor. — Subscriber, Cucamonga.

The matter of best peach was referred to J. S. Armstrong of Ontario and he answers: "We regard the Tuscan and Phillips Cling, Lovell and Muir, in order of preference as named, the best peaches for canning in this section. The latter two varieties are freestones and are also the best for drying. They are yellow to the pit, which makes them desirable for canning. Some experiments have been carried on by some of the growers with the J. H. Hale peach, which although very red at the pit, seems to can very well, the color disappearing. The peach is quite firm, and undoubtedly in time will be recognized as one of the leading canning peaches of California."

Eye Troubles

Two of my young rabbits are having trouble with their left eyes, a dark brown matter runs from the nose and forms in the eye, the left ear lies down instead of standing upright. After two or three days they get very weak and have trouble in sitting up or moving around. The rabbits are a month old and are fed on green clover, oats, dandelions, other grasses, bread, rolled barley and boiled potatoes. They are growing very fast and are fat. It has been very warm, so I placed wet sacks for them to lie on. Do you think this caused them to take cold or is it something else?—H. C. N., Castella.

These generally come from gases arising from dirty hutches or dirt under hutch and from colds caused by dampness or drafts. Change rabbits to clean, dry, warm hutch if necessary and treat as follows: Dissolve one-half teaspoon boracic acid in one-half cup warm water, wash eyes with this and dry eyes and fur around them with soft dry cloth. Examine ears for canker and if found pour in ear a few drops of solution of olive oil and sulphur, one teaspoon of sulphur in two ounces olive oil. Give two or three treatments per week according to nature of case. Wet sacks will produce colds if left in hutch after warm part of day. Be careful in feeding especially if greens are of quick growth and juicy. Good solid flesh is more desired than loose fat so feed more barley and oats. Eye troubles are contagious so separate affected animals and disinfect your hutches.—W. D. W.

Thrips on Beans

What are the insects on the beans which I send?—Subscriber, Pomona.

These leaves are infested with very small yellowish, almost white insect. They were referred to Prof. H. J. Quayle. He writes: "The leaves are infested with thrips and these are responsible for injury to some of the leaves, although there is one leaf which has a yellowish appearance which I do not attribute to the work of thrips. Unless the bean plants are being very severely injured it would scarcely be practical to apply treatment. Thrips can be checked fairly well by spraying with Blackleaf and soap. It would be a question for the individual to decide whether or not he wishes to go to the expense necessary to control the pest."

Potato Sacks

What are the regulations as to potato sacks? Can they be used where they have brands or other printed matter, that is, old sugar or poultry food labels?—Subscriber, Santa Ana.

So far as we know there is no objection to such use of old sacks. The only possible objection we see is that they are not so neat in appearance as new sacks, but new sack prices demand conservation.

Ducklings in Water

I would like to know how old Indian Runner ducklings must be before allowed to enter water. — Subscriber, Escondido.

Ducklings should not be allowed to swim until the down which is their first clothing has changed to real feathers. This is because they are so easily chilled at first and the down does not protect the skin as feathers do. As ducks do not require water for their health and comfort, except enough to wash their heads in, there is no occasion for letting them swim as long as there is the slightest doubt about their being ready.—J. A. K.

What Feed for Poultry?

In your article on the University of California poultry school in the California Cultivator for June 8 you refer to the change in the mash ration for hens. I would like to know the scratch feed when the mash is ground milo and barley and beef scrap. I am feeding my hens whole milo and rolled barley for their grain, giving them a wet mash of table scraps, (especially boiled small potatoes) a little beef scrap and bran. If there is anything easier to feed and cheaper I would like to know it, for with milo at 4¼ cents a pound, rolled barley nearly four cents, there is no profit at the present price of eggs.—Subscriber.

With the mash of ground milo, ground barley, beef scrap and cocoanut meal will be given a scratch feed of cracked corn, whole milo and sprouted barley. The corn, if I remember correctly, was raised on the University Farm. Professor Dougherty did not advocate feeding corn when it must be purchased. There is nothing cheaper than milo and barley; in fact, they seem to be the only grains within reach for most of us. The whole barley sprouted, or soaked till the sprouts begin to show, is generally preferred to rolled barley. It costs a little more but is more palatable. Your wet mash of boiled potatoes, bran and beef scrap is good. With a little green added it would be better still.—J. A. K.

Carrots for Dairy Cows

How are carrots to take place of pulp as feed for dairy cows? These are common table carrots but fairly large size. Would they make more butter fat, and how many pounds should be fed?—Subscriber, Norwalk.

Carrots are excellent for dairy cows. Some claim they are almost as good to give color to butter as springtime grass. Their greatest value is in improving the appetite. Such feed does not increase the percentage of butterfat but does increase the quantity of the flow of milk, consequently greater total of fat. Henry and Morrison say, "This root is relished by horses of all ages and conditions, but should not be fed in large amounts to hardworked or driving horses. Carrots also serve well for other stock, especially dairy cows. Hills of the Vermont station writes: 'Carrots far surpass beets in feeding value.'" They are perhaps rather more expensive than other root crops, although the larger growing varieties will yield from 10 to 20 tons per acre. They contain about 12 per cent dry matter, a great proportion of which is sugar.

Beans

What would you consider best bean for home planting in this section to have dry beans for winter use? Is the Pinto particularly good? — Subscriber, San Diego.

One of the best beans for the coast section of this county is the Lima, which may be seen by the immense plantings along the ocean front of your county. Blackeyes, Pintos and Teparies are among the best for interior, warmer valleys.

TWENTY-ONE

When youth is turning twenty-one
And boyhood drops the toys it knew,
When there's sharp drilling to be done
To hasten victory o'er the Hun,
America will find him true—
Her manly pride, her loyal son.

Dear are the dreams youth leaves behind—
For life begins at twenty-one.
Out there is honor's badge to find,
With courage of our father's kind.
But there's a man behind the gun—
A million more behind him lined.

If it may be brave France shall keep
Our hope gone forth at twenty-one,
God knows, tho' first our hearts must weep,
France will walk proudly where they sleep.
So shall their triumph, nobly won,
Live on, a better world to keep.

Yet, on some glad, victorious day,
When right has crushed the mighty Hun,
They will return—all those who may—
Love crowned, anointed of the fray,
They costly right to manhood won
As we had wished, in honor's way.

No vain regret has twenty-one.
Its glad, prophetic day is here.
Life's great adventure has begun,
No clouds obscure ambition's sun.
March on! O faith, without a fear,
New Worlds are wrought, at twenty-one.
—George E. Bowen of the Vigilantes.

THE CONSCRIPT

Concluded from last week.

He did not undress. Only he removed his shoes. In his stockinged feet he could creep from the house unheard and seek sanctuary in the night woods. He would wait till all was quiet. until the woman was in her bed and asleep—then he would slink away and leave her.

He blew out the lamp and sat silently in the darkness for a long time—hours it seemed. A pall of quiet rested over the house and over the world. Sims deemed it was safe to go now. He opened his door softly and tiptoed toward the front door. It was but a step down the narrow hall. His hand was on the knob when he heard a stealthy movement without, and a whisper:

"Ready. Smash in the door. We'll yank her out and tie her to a tree. . .'.

Sims was too late, he was trapped!

The next instant a panel of the door splintered; the next instant Sims had to spring back to avoid the door as it tore from its fastenings and hurtled inward. As he sprang a light glowed, and he knew the woman was standing in her door, lamp in hand.

"You're there . . ." he heard her say. She was depending on him.

With the falling door came a couple of men. Their momentum brought them against Sims, and before he could act on his own volition, he was, for the first time in his life, locked in bodily combat.

Two men were upon him, themselves taken by surprise. Behind them he saw rushing in two more. These were useless in the combat, for Sims and the two men who rushed upon him filled the narrow hall from wall to wall.

In those first seconds Sims fought like a cornered rat, lashing out with fist and foot. He was terrified. Each second he expected the tearing stab of physical pain, for the pain which was a horror to him. He fought blindly, using his great strength without his brain's direction.

"I'll hold the light." said the woman, her voice trembling but clear.

The rays of the lamp fell upon something that glittered. It was a knife in a man's hand. Sims uttered a bellow and lunged forward. The knife fell, penetrated the flesh of his shoulder, tore its way through cloth and skin and tissue. Here was the pain! He sensed it, wondered at it. This, then, was the thing that had made a coward of him! This was agony!

Sims caught the man, jerked him close, lifted him clear of the floor while the man, his knife lost, battered Sims' face with his fists. The second man was not idle, for Sims grunted and staggered under a blow from a short club.

From that second Sims fought, not like a rat, but like a man. He had experienced pain, pain received in battle, pain given by cold steel. He had felt it, and had endured it, was able still to fight. He hurled the man he held upon his fellow so that the two crashed to the floor. One did not arise, but the remaining three Hobbs' Crackers trampled their companion's body to get at the big young man who stood between them and the woman holding the lamp.

They flung themselves upon him, striking, gouging, seeking to pull him down upon the floor where he would be at the mercy of their feet, but he spread his legs mightily and resisted with the strength that Nature had given him. . . . They drew back, hesitated for a new rush. . . . Sims emitted a bellow, which was no bellow of fear, but of rage, of battle lust, and sprang. He charged as the lion charges, blindly, furiously. Each hand seized the neck of a man. He stopped, braced, and swung his hands together, so that head cracked against head. It was no light contact. The possessors of the heads dropped limp and motionless. The fourth man, large of frame as Sims himself, did not lose heart. Sims met him breast to breast. His arms passed around Sims' waist, Sims' arms about him, and each man's chin rested on the other's shoulder.

So they stood, motionless, apparently resting, but they were not resting, for each man was putting into his arms and back every ounce of his strength. Each man was striving to dig his chin into his enemy's throat, to bend backwards his head and shoulders while holding the waist in a crushing grip.

There was no motion. It was a terrible spectacle of relentless effort. Suddenly one of Sims' shoulders lifted a trifle; his arms tightened in a supreme effort. Slowly, slowly, the man's shoulders moved backward, backward. Sims dug in his chin, he felt the arms of his antagonist relax. There came a gurgle, a dull snap, and the man hung limp in his arms. . .

He staggered back and leaned against the wall. At his feet lay four men, writhing, groaning, or quite still. He had done that! Something sticky was on his hands. He looked. It was wet and red. . . . He who had been afraid of blood!

The woman advanced and threw the light upon him.

"You're hurt. . . . Your head! It's bleeding! . . ."

"Yes," he said in a queer voice, "I'm stabbed through the shoulder, too. I guess other places."

"But you did it," she said quietly. "Four of 'em! . . Your Ma must be proud of you."

He looked at her oddly. "Pain," he said, "isn't so bad . . not so bad."

"No," she said, not understanding. ". . . What a soldier you'll make!"

He sank to a sitting posture on the floor and giggled ridiculously. "I was running away," he whispered, "running away from the draft . . . I was running because I was afraid to fight."

"Here," she said with sudden energy, "hang onto yourself. We got to see to these."

Blindly, weakly, staggering as he walked, he helped her dispose of the

To the People of California:

★ ★ ★

TO CLEAR up any confusion that may exist in the minds of housewives concerning food conservation, the following definite program of food saving is issued with the explanation that frequent changes are made necessary according to the needs of the Allies and our own people:

1. All kinds of staple foods, especially wheat, meats, fats and sugar should be most economically used. Use substitutes for these four commodities.

2. No food should be hoarded. Hoarding is the holding, contracting or arranging for food by any person in excess of his reasonable requirements for use or consumption by himself and dependents for a reasonable time. This does not refer to stocks of home-grown vegetables and home-canned or preserved fruits.

3. All householders who can entirely eliminate the use of wheat until the next harvest, about September 1st, should do so.

4. Householders who are obliged to use wheat should not use more than a total of 1½ pounds of wheat flour or prepared wheat, in any form, per person per week, including the wheat flour in Victory Bread, and including the wheat flour or prepared wheat in crackers, pastry, macaroni, breakfast and other foods.

5. Victory Bread is bread manufactured by bakers under the rules of the United States Food Administration. In estimating flour consumption, 1¾ pounds of Victory Bread may be considered equal to 1 pound of wheat flour.

6. In buying wheat flour an equal weight of other cereals as substitutes for wheat flour must be bought pound for pound. This is the 50-50 Rule. In buying mixed flours, the substitutes in them may be counted so that a smaller proportion of substitutes may be bought with these flours than with white flour. In buying graham and whole wheat flours (containing not less than 95% of the entire wheat) 6/10 pounds of substitutes shall be purchased with every pound of such flours.

7. Wheat flour substitutes are hominy, corn grits, cornmeal, corn flour, edible cornstarch, barley flour, rolled oats, oatmeal, rice, rice flour, buckwheat flour, potato flour, sweet potato flour, soya bean flour and feterita flour and meals.

8. Householders in towns and cities may not buy more than ⅛ of a barrel of flour or 2 pounds of sugar at any one time. Householders in rural districts may not buy more than ¼ of a barrel of flour or 5 pounds of sugar at any one time. In no event shall any purchaser have more than 30 days' supply of either on hand.

9. Householders should not use more than ¾ pounds of sugar per person per week.

10. In addition to the above, however, sugar may be used for home canning, and will be available to the householder for that purpose upon signing a certificate that such sugar is desired and will be used only for that purpose.

11. No wheat flour, or prepared wheat in any form, should be used for any purpose other than human consumption.

12. Meats of all kinds, particularly beef, should be most economically used, eliminating all waste.

13. Fresh milk and milk in evaporated and condensed form and cheese may be liberally used.

14. Butter may be used for normal consumption.

15. To save transportation local supplies should be grown and used.

U. S. FOOD ADMINISTRATION FOR CALIFORNIA

bodies of the men so that she could minister to them.

"I'll do what I can," she said, "till mornin'. Then we can send word to their families to come git them.

Until she had done what she could for the men she did not touch Sims' wounds . But now she forced him into a chair and washed and salved and bandaged his hurts. . . . They were many and painful . . . and as she bandaged she talked.

" . . . You was runnin' away. I kind of figgered somethin' was wrong . . . A man as brave as you thinkin' he was afraid! . . . Well, you'll be runnin' back tomorrow . . . "

"Yes," he said simply, and presently, under the soft touches of her hands upon his brow, he slept.

When he awoke in the morning the injured men were gone. "I'll be going, too, after breakfast," he said.

She nodded assent. "If you're able to walk," she said.

When it was time to say good bye she extended her hand.

"If you see my boys—" she said, and he knew what she would have him say to them.

"Good bye," he said—that was all.

Part of the way he limped painfully, part of the way he was lucky enough to catch a ride, and so arrived in midafternoon at his home town. Curious eyes followed his figure as he limped straight to the room occupied by the officials in charge of the draft.

"I was drafted today. I've come to report," he said.

"Name?"

He told them, and they studied their lists.

"Some mistake," said the official, "you were not drafted."

He staggered and sagged into a chair offered by a ready hand. Not drafted! . . . He had known he would be—and had run away. The whole thing had been vain and useless . . . No, it had not been vain and useless . . .

"I—I've got to be drafted," he said chokingly. "I've got to serve . . . You must fix it . . . "

"Why, man, you're a wreck now."

Sims faced him levelly, with burning eyes. "I got this learning to fight for my country," he said. "I was afraid—afraid of the draft, and ran away." And then he told them. "So I've got to go. . . . Can't you see? I've got to go. . . . What would she think?"

The officials looked from one to the other, and nodded their heads. "I guess he's right, gentlemen. He's got to go. . . . Here, scratch out that name—and write down Sims."

"Thank you," said Sims quietly.

As one man the officials stood, facing Sims, and lifted their hands in salute. His eyes widened with surprise, with joy. They were saluting him. Awkwardly he lifted his hand to his temple in response. Then he turned, pride radiating from every feature and limped out of the office—a Conscript.—Milestones.

THE FUNCTION OF THE FOOD ADMINISTRATION

To so guide the trade in the fundamental food commodities as to eliminate vicious speculation, extortion and wasteful practices and to stabilize prices in the essential staples.

To guard our exports so that against the world's shortage we retain sufficient supplies for our own people and to cooperate with the Allies to prevent inflation of prices.

To stimulate in every manner within our power the production and saving of our food in order that we may increase exports to the Allies to a point which will enable them to properly provision their armies and to feed their peoples.—Herbert Hoover.

SAVE MONEY BY CARING FOR YOUR CLOTHES

Money, time and labor may all be saved if the clothing is carefully cared for each day.

The hole should be mended when it first appears. If left it grows larger disfiguring the garment to a much greater extent and requiring more time for repair.

When hooks, eyes, snaps or buttons are not promptly replaced the garment is soon pinned out.

If all spots are removed and the garment carefully brushed and pressed before it is put away, it is always ready for wear.

This constant care not only lengthens the life of a garment, but keeps it looking well as long as it lasts.—Charlotte E. Carpenter.

"IZE"

If in thy day thou would'st be wise,
Regard this mighty truth—"Time flies."
As dawn shall tint yon Eastern skies
And sun in splendor start to rise,
Observe thee well and do likewise.
And when the day is of full size,
Work like Sam Hill and advertise.
But these are days to specialize,
So, as old Kaiser Wilhelm tries
To load the atmosphere with lies
And start the most heart-rending cries
From innocents, why, let's surprise
His nibs with wallop 'twixt the eyes
His ugly mug to paralyze.
Then trim his frame to normal size.
But if, as we may well surmise,
We surely cannot all arise
In fighting mood to land such prize—
We'll do our best—let's HOOVERIZE.
—Samson Siftings.

San Francisco, July 1, 1918.

BUTTER

The quotations on butter are on the basis of solid packed cubes. To ascertain the market price of butter in squares, add to the cubes basis price per pound as follows:

Two-pound squares, parchment wrapper, ½c; 1-pound squares, parchment wrapped, 1c; 2-pound squares, in cartons, 1½c to 2½c; 1-pound squares, in cartons, 2c to 3c.

Beeswax	36@40

HAY

Under date of June 29, Scott, Magner & Miller says:

Receipts past week, 1457 tons. The falling off in the receipts is no doubt caused by inability of farmers to get their hay baled as well as some little difficulty in obtaining cars for shipment. This decrease is somewhat of a surprise to the trade as it was natural to suppose that they would be much larger from week to week. As the food administration will not countenance the buying of hay or other commodities for speculative purposes, it is a question with a great many dealers as to what constitutes speculation. We believe that the purchase of hay for storage, if done with the intention of getting higher prices than the cost of hay plus the storage charges, will be looked upon with disfavor; while should the hay be purchased for storage only to fill contemplated business at the regular range of profit over cost, then it will be looked upon favorably. However this may be, it certainly will be determined during the season.

Alfalfa is showing considerable firmness and there is a good demand, especially for the river products, the second cutting of which is just about ready to arrive.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:

Fancy Wheat Hay (light 5 wire bale)	25.00@26.00
No. 1 Wheat or Wheat and Oat Hay	21.00@23.00
No. 2 Wheat or Wheat and Oat Hay	18.00@19.00
Choice Tame Oat Hay	23.00@24.00
Other Tame Oat Hay	20.00@22.00
Wild Oat Hay	17.00@20.00
Barley Hay	17.00@20.00
Alfalfa, first cutting	15.00@20.00
Stock Hay	14.00@16.00
No. 1 Barley Straw, bale	50@80

GRAIN

Wheat—Government prices: Common white hard, base price, $3.50 per cental, or $2.10 per bushel of 60 pounds delivered in terminal warehouses in bulk; soft white, base prices, two cents per bushel less, or $2.08 per bushel; white club (including Sonora), $2.00 per bushel. If wheat, after cleaning, weighs 60 pounds or more to bushel, base price stands; if 58 to 60 pounds to bushel, three cents per bushel reduction; if 56 to 57 pounds six cents per bushel less; if less than 56 pounds, grain becomes sample grain and sells on its merits up to within one cent per bushel of 56-pound wheat. Additional charge made for sacks.

SEEDS

Prices in round lots, lb.:

Millet, recleaned	5@5½
Alfalfa, lb.	20@21
Flax	7@7½
Hemp	5@5½
Rape	2½@3

Citrus Fruit Market

Los Angeles, July 2, 1918.

The June drop has not been heavy but growers are still watching and expect many fruits still on the tree will yet drop. North of the Tehachapi the drop has been more serious and some estimate the crop will not be over 50 per cent of normal.

The marketing conditions remain fairly favorable though prices are not holding up to earlier high level. Presumably this is because of immense quantities of fresh fruits.

Lemons are likewise showing easier tone though occasional sales are made around a $10.00 mark.

Shipments

Shipments of citrus fruits to date since November 1, 1917: Southern California; oranges 11,655, lemons 4003, total 15,658. To same date last season oranges 31,871, lemons 6044, total 37,915. Central California this season; oranges 2536, lemons 115, total 2641. Last season to same date; oranges 4655, lemons 164, total 4819. Northern California; oranges 203, last year same date, 845.

AT THE AUCTIONS

June 27

New York: 16 oranges, 2 lem. Val. 2.65-7.05, lem. 6.45-7.45, grapefruit 2.50-3.20.

Philadelphia: 4 cars. Val. 4.00-6.75, lem. 6.15-8.70.

Boston: 9 cars. Val. 2.20-6.50, lem. 3.85-7.90, grapefruit 3.30.

June 28

New York: 14 cars. Val. 3.05-7.95, lem. 4.15-6.65, grapefruit 1.70-1.80, Mikes 4.00-5.65.

Cleveland: 4 cars. Val. 3.35-5.00, lem. 7.25-8.25.

Boston: 8 cars. Val. 3.60-6.85, lem. 4.80-7.65, grapefruit 2.75-2.80.

St. Louis: 7 cars. Val. 4.00-6.60, lem. 2.20-8.05, lemonettes, 3.85-4.00.

Boston: 12 cars. Val. lower. Val. 4.00-6.65, lem. 5.55-7.75.

St. Louis: 6 cars. Val. 3.75-6.40, lem. 3.65-6.20.

THE SLACKER HEN

Continued from Page 17

er. Then the slacker hen is a quiet hen, doesn't go about the run singing, nor talking to her caretaker. These three things; the color of the comb, the condition of the crop at night and her dull, listless manner are almost certain marks of the slacker. I have in mind one little Rhode Island Red in my own flock. She isn't a fancy bird, but her crop is always full, her comb always red, and she is always moving. When you see a bird like that, you know without asking that she is no slacker, and that is the only kind of hen worth keeping. Let us be very hard hearted with these slacker hens that eat up our profits. Don't let one get by on her looks. If she is there with the goods, let her live; if not, off with her head!

Farm for Profit

and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

Have You Met This Kaiserite?

NAIL LIES LIKE THESE!

THAT Red Cross supplies are being sold to shopkeepers by dishonest Red Cross officials.

THAT the Masonic orders have protested against allowing the Knights of Columbus to build recreation huts for soldiers.

THAT interned German prisoners are being fed five meals a day.

THAT this is "a rich man's war" or "a business man's war."

THAT farmers are profiteering.

THAT nine American warships were sunk in a disastrous engagement in the North Sea.

YOU FIND HIM in hotel lobbies, smoking compartments, clubs, offices and even in homes. He thinks it's clever to repeat "inside facts" about the war. He is a scandal-monger of the most dangerous type.

He repeats all the rumors, criticisms and lies he hears about our country's part in the war. He gives you names, places, dates. He is very plausible.

But if you pin him down, if you ask him what he really ***knows*** at first-hand, he becomes vague, non-committal, slippery. He tries to make you think that the Government can fool you, if you are willing to let it—but it can't fool him. No, siree! He's too smart.

People like that are hurting your country every day. They are playing the Kaiser's game. They are fighting against this country. They are making it harder to win the war.

Through their vanity or curiosity or ***treason*** they are helping German propagandists to sow the seeds of discontent.

For every lie that has been traced originated with a German spy. Don't forget that.

There was the one about the President's Secretary. It was said, and said again, and spread broadcast that Mr. Tumulty was convicted of treason and shot at Fort Leavenworth. That lie was easily scotched by a public statement from Mr. Tumulty himself.

But other lies are more insidious—harder to down. In another paragraph some of them are told. But they are only a few of many.

They are taken from a publication, issued by the Committee on Public Information, called:

"THE KAISERITE IN AMERICA"

101 GERMAN LIES

This little book describes the methods of Germans here and quotes 101 lies that have been nailed by a newspaper which took the trouble to run them down. It will be sent to you upon request.

Get the Facts from Washington!

Get in the fight to stamp out this malicious slander. As you travel about the country or even in your social life at home, run down these lies. Call the bluff of any one who says he has "inside information." Tell him that it's his patriotic duty to help you find the source of what he's saying.

If you find a disloyal person in your search, give his name to the Department of Justice in Washington and tell them where to find him. It is your plain and solemn duty to fight the enemy at home by stamping out these lies. Where shall we send your copy of this book? It's free!

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Shorthorns and Mendocino pastures are given place of honor on this week's cover. These pastures are on Fair Oaks Ranch at Willits and show wherein that county gathers some of its riches.

FOURTH LIBERTY LOAN

We must begin our planning for the Fourth Liberty Loan; it will be weeks yet but it's coming. It will be for double any former loan, six billion dollars, and will bear interest at four and one-quarter per cent. It will require some planning, some saving, possibly some suffering, but we must meet it.

PROTECT THE WATERSHEDS

An Encanto subscriber has written regarding the oft-made charge that cattlemen desiring better pasture in the mountains for the coming season were responsible for many of the fires in California watersheds.

It may be true that in former times cattlemen were responsible for these fires, but since fuller appreciation of the awful losses to the state from these fires has obtained we do not believe the injury from this cause is of any material extent. Besides the feeling of patriotism which our cattlemen bave there is the further protection these days afforded by the forest rangers who are during the summer season on duty in all national forests. We need more and better pastures, but more, our orchards and fields need greater water supplies, and these can only be supplied through watershed protection.

WHEATLESS DAYS

State Food Administrator Merritt in a recent address before the barley growers of the state at Davis said. "The United States and Canada will have an excess wheat supply of approximately 500,000,000 bushels, and Australia will increase that total by 150,000,000 bushels, all of which will be available if the Allied governments are able to secure bottoms to transport it.

"This means that France and England, or the government of the United States are not in the market for barley as a substitute. The supply of wheat is ample and the governments are purchasing wheat in preference to barley."

At the same time reports from the department of agriculture indicate a shortage of 40,000,000 bushels, or a cut of 891,000,000 bushels from the 931,000,000 bushels of earlier estimates, and it may be said that when that estimate was made there was a faint hope that the billion bushel mark might be reached. However, the "wheatless day abolishment" rumor persists and has been spread by one newspaper. The Los Angeles office of the food administration denies any knowledge of suspension of former wheatless rules, but Mr. Merritt is at the head of the state food administration, and, if he is correctly reported, he has a most hopeful view of America's excess wheat production.

SUGAR

Everyone in this country must save sugar. All eating houses are now licensed, and most drastic regulations are being enforced as to distribution. There have been great losses because of the submarine. The need of using all the nation's shipping to carry soldiers to France has prevented importation, and war is now making great demand on the sugar supply. Present regulations permit the purchase at one time of only two pounds of sugar for household use, and the use of three pounds per month per person. Upon signing a blank agreeing to use the sugar for canning purposes a purchase of 25 pounds may be made. Some housekeepers have not understood the full meaning of this regulation and have signed the canning card and taken home sugar which is partly used for canning and perhaps part of the supply turned over for table use. This is a violation of food regulations which may result in trouble for some of our housekeepers. As the shortage becomes more serious the regulations may be more rigorously enforced.

The violation of food regulations has not been because of disloyalty, but we believe almost invariably is due to pure thoughtlessness.

We are at war.

T. P. LUKENS

T. P. Lukens, one of California's best friends, has passed. For years he has preached the gospel of more trees and the protection of our watersheds, and he has done it as no other Californian has. Like Johnny Appleseed of the Middle Western states, Mr. Lukens has tramped California mountains with steel staff and many trees are now growing, especially in the Sierra Madre, the seed for which were placed by Mr. Lukens. But when it was found that seed so planted were not always, nor even in large percentage, successful in making covering for our mountains, he secured the adoption by the bureau of forestry of a system of forest tree nurseries which were established, and millions of young pines and other trees were produced and planted. Californians are not yet able to see the real benefits of this work which was started by Mr. Lukens, and they will not for a score, or perhaps scores, of years. But we can at least anticipate a bit of the credit which will later be given to him and those who have followed in doing his work. With his ability to see and do those things which will add much to the state's welfare, he was with it all a most lovable character and will be missed by his many California friends. The writer recalls with much pleasure tramping for many a mile in California forests when with others we tried to get from Mr. Lukens a vision of the necessity of saving California's productive valleys by reforesting and saving her burned over watersheds.

NO PLACE FOR THE SISSY

Speaking to a bunch of city boys who have an ambition to take up agricultural life J. B. Lillard, state supervisor of agricultural education in public schools, recently gave a fund of information regarding what farming is—and isn't—which we are glad to quote from:

"Farming is a man's job. The successful farmer must have experience. He must know how, when, where and whether. He must possess a good knowledge of feeding, planting, cultivating, harvesting, fencing, and a good many other things, but in addition to knowing how, when and where to plow, plant, cultivate, feed and fence, he must also know whether to plant the same crop or rotate, whether to sell or feed his crop to animals, whether to raise only one crop or several. In addition, it is desirable that, as far as possible, he know why.

"Further, the successful farmer must use good business methods. He may know how, why, when and where, but poor business management would probably break him. Recent failures in farming by professional people, even including successful teachers who were graduates of colleges, show that success in real farming depends among other things upon something not found in books.

"There is another thing which is necessary in successful farming, and that is that the man must like farming and country life. By the way, it is quite as important that his wife like it, too. Again, farming requires patience and hard work. When the days are long and hot and it is necessary to speed up in order to do the work properly and make it pay, the farmer is put to a severe test.

"Does it look easy? Good-meaning dreamers who have spent a Sunday in the country see the farm and taste its products, but have no idea of the experience, brains and hard work it took to bring the result—to make it a paying business and a good place to live.

"The farm is no place for the fellow who is a sissy, who loafs on the job, who can't take one bump and then stand up and take another one, and who can't learn something every day.

"Farming calls for all those qualities which a real man must possess. It is an art; it is a science; it is a business; it is a mode of life; it is a man's job."

This Week's War Notes

The federal government advanced to 19 railroads of the country over $6,000,000 during the month of June. This increases the advances made to various railroads to $60,509,000.

The United States transport Covington, homeward bound, was torpedoed in the war zone July 1. Six men of the crew were lost. There were no soldiers or passengers aboard.

The registration of June 5 shows 744,865 young men who have reached fighting age since June 5, 1917. New York had the greatest registration, with 69,525. California's registration was 18,834.

An offensive has been begun by the French and Italian troops in Albania. The River Voyusa has been crossed and an advance of about 15 miles made. The town of Fieri, about 18 miles north of Avlona, has been captured, and the Italian troops have extended their lines some 18 miles up the Adriatic coast.

There were launched during the past year vessels aggregating a tonnage of 1,430,793. This increased America's tonnage on July 1 to 10,040,659. The celebration of the Fourth of July launchings on the Pacific Coast was made notable by the presence of Chas. M. Schwab, head of the ship building commission.

The situation in northern Italy continues entirely satisfactory to the Allies. The Italians have administered awful punishment to the Huns, and it is estimated that since July 2 the Austro-Hungarians have lost in excess of 20,000 men. They have been trapped in the marshes along the Piave and slaughtered in great numbers, and every point along the river is now in the hands of the Italians.

On the first of July announcement was made by the secretary of war that the United States has now in France in excess of 1,000,000 troops. Some 700,000 or 800,000 of these have arrived in France since January 1. Since that date the number crossing the Atlantic monthly has increased from 46,776 during the month of January to 117,212 in April, 244,345 in May and 276,372 in June. With the newly commissioned ships increasing rapidly in number the troops sent each month will now be greatly increased.

Conditions in the interior of Austria are causing Berlin much trouble. Hungarian troops are incensed over the fact that Hungarians have been unduly slaughtered in the northern Italy drive. It is charged that Austrian and German commanders placed the Hungarians where there was the greatest danger and loss of life. Food riots have been largely subdued through the force of Ludendorf and the German troops. Careful estimates show that over 300,000 Austro-Hungarian troops have deserted since the beginning of the war. Many of these escaped to the armies of the Russians, Servians and Rumanians.

Russians are revolting from the Bolsheviki rule. During the past week Count Mirbach, German consul to Moscow, has been murdered, and there is anarchy in that city. Martial law has been declared, but the troops of the Bolsheviki are unable to enforce it. The streets are barricaded and there is much fighting from the housetops. Intervention by the Allies is generally considered as near. The demand of Berlin that the murderers of Mirbach be punished has been ignored. Troops of the Allies are still in Vladivostok but thus far have taken no action other than to guard the stores in warehouses there. It is supposed that other troops are guarding army supplies near Archangel. One thousand Chinese peasants in Chinese Turkestan have been murdered by roving bands of Bolsheviki. The charge d'affaires of the United States to Siberia has transmitted to the department of state a note expressing appreciation of President Wilson's declaration of sympathy with the Russian people.

The situation on the western front remains much as last week. The Allies are guessing as to the intention of the Teutons, and one guess, which seems to be a shrewd one, is that there is fierce dissension among the heads of the war department and that the defeat in northern Italy and the situation in Russia has complicated matters and prevents the western plunge as anticipated. However, every day sees thousands of new Yanks landed and added to the fighting force of the Allies, and big guns are being located so as to make the Allied line stronger. The French have made an advance of nearly a mile on a front of two and a half-miles south of Montdidier. On the Fourth of July Anzacs and Americans combined made a strong advance, capturing Hamel and a large section in the Somme district. This was in the nature of a surprise and resulted in the capture of a large number of German troops. The Fourth was celebrated at Washington by a great gathering at the tomb of Washington, where President Wilson made an address, said by many to have been his greatest.

Caprification and Varieties of Capri Fig

A bit of history, not ancient but wonderfully interesting, is contained in an address made some time since at a fig growers' meeting at Fresno by Geo. C. Roeding. Mr. Roeding gave some of the best of his life to establishing the fig industry in this state, and he is entitled to great credit for his persistent work. As many readers of this paper were not in this state during the earlier days of the fig industry, and as questions regarding caprification are so frequently asked, we are glad to print from the address of Mr. Roeding which tells of his own and others' experience in Asia Minor and in California.

IN THE year 1880 the San Francisco Bulletin Company, through the effort of G. P. Rixford made an importation of fig cuttings from Smyrna and Asia Minor. Later, they made a second importation, in which the late Governor Stanford actively cooperated with them. These cuttings were distributed to their subscribers, but when the trees bore and all the fruit fell off, the people who had planted them concluded that they were worthless, and the Bulletin Company was censured for its enterprise in this matter. The Bulletin people themselves were finally forced to the conclusion that they had been tricked by the wily Smyrnaites.

In the year 1885 E. W. Maslin, who owned a property at Loomis, Placer County, raised a lot of trees from seeds of the finest imported figs and planted them in orchard form. In 1889, in an address which Mr. Maslin made before the State Fruit Growers' Convention, he stated that the trees had made a wonderful growth, bore an abundance of fruit, but had all dropped off without maturing. My father, the late F. Roeding, sent the foreman of our nursery to Smyrna to investigate conditions there and to bring back a lot of cuttings. These were planted in nursery rows in 1887, and in 1888 the first orchard of 20 acres was planted. The orchard was gradually extended until in 1890 there were 60 acres. These trees were pruned, cultivated and irrigated up to 1901 without harvesting one single crop of fruit, due to the absence of the fig wasp. The perplexing difficulties which arose in connection with the introduction of the fig wasp might have been avoided, and the many years which intervened before the valuable insect, Blastophaga Grossorum, was finally established, might have been brought about much sooner had the man whom we sent to Smyrna devoted closer attention to the work he had before him instead of allowing his duties to be interfered with by other matters of a more exhilarating nature.

During all this period I faced ridicule, discouragements innumerable, and even my father, as interested as he was in the subject, tried to prevail on me to dig the trees up, and say "good bye" to my fig folly. It finally resulted in his deeding the Roeding place to me, for he feared that between the nursery business (which he regarded as the most hazardous on earth) and the fig business, that I would put him in the poor house.

In 1889, the late B. M. Lelong, secretary of the state board of horticulture, in his annual report wrote as follows about "Caprification":

"It has often been claimed that 'The fig in this state does not set, that caprification is absolutely necessary, that the seeds having no kernels fully establish this fact.' If caprification is absolutely necessary, this question arises: 'Why do figs produce and set their fruit as well as they do in this state without it?' No fruit can set without the flower be first fertilized; therefore, if our figs set their fruit, it is by the fertilization they receive from the pollen of the flowers; if there be no pollen to fertilize the female flowers, no fruit could set.

"In the fig the organs of fructification are hidden from view, therefore we cannot tell exactly when fertilization is effected, but it is supposed that it takes place when the eye assumes a pinkish hue and expands and admits a little air into the interior, where the flowers are.

"In many parts of Italy and the south of Europe in olden times cultivators paid much attention to setting the figs by the method of carprification. This practice was much believed in, but is condemned by most modern scientific writers as absurd.

"Caprification, according to the experience of practical growers, is altogether a delusion, and many of the largest plantations of the old world have continued to bear fruit without the aid of the caprifig."

On November 10, 1891, I read my first paper on the Smyrna fig, reviewed my experiences and outlined what I expected to accomplish. In the previous year, in the early summer months, I demonstrated to my own satisfaction the absolute necessity for caprification to produce the genuine Smyrna fig. I gathered pollen on the end of a wooden toothpick, forced this through the eye of a Smyrna fig, and every fig thus treated matured into fruits, while others fell off.

In the year 1891, in the month of June, I carried on the same experiment again, except that I improved on the original idea by blowing the pollen gathered from the profichi crop into the Smyrna fig, by using a glass tube drawn down to a fine point, and inserting this into the eye of a fig. The interior of the fig was not injured by this method and the result was far more satisfactory. In October, 1891, I exhibited caprificated Smyrna figs in San Francisco, and I take the liberty of quoting from an article which appeared in the Pacific Rural Press of October 10, 1891 by E. J. Wickson:

"We enjoyed on Tuesday a call from Geo. C. Roeding of the Fancher Creek Nursery, who brought samples of his Smyrna figs from goose-quill caprification; also White Adriatic figs to compare with them. All were cured and packed in good style. The White Adriatic figs were as well cured as any we have ever seen and handsomer than we supposed they could be made without processing and sulphur. They were, however, very inferior in appearance and notably so in flavor to the Smyrna figs cured in the same way. The Smyrna figs had plenty of well filled seeds, pulp of a translucent character, and with more of the true Smyrna flavor than we have yet found in a California dried fig. The White Adriatic had fewer seeds, pulp of a more opaque character, and flavor far less acceptable.

"These samples certainly showed that there is something in the cross-fertilization of the Smyrna fig at least. Mr. Roeding operated on about 150 figs this year with the pollen of the Capri fig. These perfected fruit; those not thus pollinated did not reach perfection.

"Mr. Roeding will proceed with his work in this direction, will introduce the blastophaga on his own account, and spare no pains to reach a demonstration of the proposition."

In the Year Book of the State Board of Horticulture of 1891, Mr. Lelong again held up the whole subject of "Caprification" to further ridicule. In this report the so-called male and female blastophaga were illustrated. The male happened to be the female and the female was in reality the parasite, Philotrypesis, which failed, fortunately for us, to become established when the fig wasp was introduced in 1899.

At the time Mr. Lelong's report came out, Dr. C. V. Riley was chief of the division of entomology of the United States department of agriculture, an enthusiastic believer in the ultimate success of Symrna fig culture in California, and he severely criticised Mr. Lelong later for his lack of knowledge on the subject.

In the eight years that followed, I carried on my experiments in artificial pollination by the blow pipe method. Meanwhile I continued my efforts to secure the blastophaga, and did during this period obtain live insects at several different times, but they invariably failed to establish themselves. Finally, through the the efforts of the state board of trade, and more particularly through the concerted action of E. W. Maslin, who never lost interest in the subject, although he no longer owned the place at Loomis, and with the assistance of the late B. N. Rowley, the importance of the subject to the fruit interests of California was ably presented to the Hon. James Wilson, who was then secretary of agricul-

Agricultural News Notes of the Pacific Coast

Northern California

Ione, Amador County, recently shipped 33 cars of stock cattle valued at $133,000.

Rich river lands near Sacramento are becoming great shippers of yellow onions.

Farm center meetings in Placer County: Bowman school house, 17; Roseville, 22.

Sacramento reports at least 50,000 acres of beans planted in the Sutter Basin portion of the valley.

Poultrymen are planning to make the state fair August 31 to September 8 a great gathering of poultry people.

Cattlemen of all California convened at Davis last Thursday and Friday and discussed feed and other questions as to greater meat production.

Farm centers of Shasta County are formulating plans for financing the wheat crop so that the farmer may live until marketing is possible.

Susanville, Lassen County, made its largest wool shipment in many years. It was only one car but it contained 22,000 pounds and aggregated in value $13,000.

Food Administrator Merritt has announced that he will have nothing to do with fixing the prices of barley; that the law of supply and demand will control entirely.

The University Farm at Davis will feature two courses in gas tractor handling at the short courses this fall. The first will be November 11-19 and the next November 20-22. The latter will be for experienced men only.

A number of the largest barley growers of Glenn County met at Willows and formed an association similar to the rice growers association. The idea of the association is to furnish the crop to the consumer at a living price and still receive fair return.

Shasta County farm center meetings: Churn Creek, July 12; Cottonwood, 15; Bella Vista, 17; Stillwater, 19; Whitmore, 23; Millville, 23; Palo Cedro, 24; Fall River Mills, 27; Burney-Hat Creek, 28; directors' meeting, Redding, 18.

Food Administrator Merritt referred to the need of a "Farmers Service League" at the cattlemen's meeting held recently in Davis. He suggested that the live stock man should be able to meet the grain grower and make compromise which would give both justice in the matter of prices; and to this end he thought the formation of such a league would be beneficial.

Rice growers of Butte County are concerned as to the supply of irrigation water; attempts are being made to induce the Great Western Company to let go of the waters of Lake Almanor. The flow in the Feather River is now running as low as 450 cubic feet, while it should in normal years run above 800 feet per second.

The federal food administrator for Humboldt County has found violations of the food rulings so serious that he is calling for the return of surplus sugar. He insists that sugar sold for canning purposes must be used for canning purposes or returned at once. The administrator has found that some residents have purchased as high as 400 pounds for "canning" purposes.

Central California

Another branch of the state insectary is to be installed at San Diego.

The Irrigation Districts Association of California met at Modesto June 29.

Hanford, Kings County, proposes to have a free market.

The Tulare Lake grain crop is estimated to aggregate $3,000,000 in value.

The Terra Bella tomato cannery will start about August 1.

Santa Cruz County is urging a greater number of colonies of bees.

Merced County farm bureau meetings: Planada, July 12; Amsterdam, 19; El Nido, 25; Eschscholtzia, 27.

Merced County has finished its driving and hunting campaigns on jackrabbits and recommends a general poisoning campaign.

The farm bureau cow testing association of Imperial County finds the cost for cow testing $1.50 per cow per year.

Articles of incorporation were filed at Riverside recently for the Orange Belt Honey Producers' Cooperative Exchange.

Merced County has completed its fire fighting organizations and has adopted the slogan: "The danger season is here; be careful."

A branch of the California Alfalfa Growers' Association is being discussed at Fresno, where a meeting was held July 8.

Californians are urged to increase their consumption of pink beans; we may be compelled to like them another year.

The Tulare County Growers' Association cannery at Porterville will be operated this year by the Porterville Canning Company.

Coachella Valley reports its cotton crop, which is small for this year, as in exceptionally fine condition, and it is predicted that another year will see 2000 acres planted.

Santa Cruz County farm center meetings for July: Bonnie Doon, July 12; Santa Cruz, 15; Aptos, 19; Socquel, 24; Happy Valley, 26; directors' meeting, 19, 10 a. m.

Tulare County cattle have been poisoned by eating young lush Johnson grass. It is claimed these young shoots are impregnated with hydrocyanic acid.

The officers of the Porterville Citrus Association for the coming year are: W. P. Bartlett, president; H. C. Carr, treasurer; J. A. Milligan, secretary and manager.

Tipton, Tulare County, alfalfa growers representing 3000 acres of alfalfa recently assembled to discuss matter of affiliating with the State Alfalfa Growers. Only about 1000 acreage signed up at the first meeting.

At a mass meeting held recently in San Luis Obispo charges were made that the Order of Herman's Sons had sworn allegiance to the kaiser. Later the lodge was disbanded and $500 in its treasury turned over to the home guards.

Tulare County farm bureau recently held a fat hog auction at Tulare. Most of the stock was sold to the Wilson and Cudahy Companies of Los Angeles. There were 245 head sold, prices ranging from $15.50 to $15.60, that is, for good large stock; some small stock sold as low as $14.50.

Southern California

Riverside has three canneries in operation.

Chino cannery started on July 5.

Imperial County offers a ten cent bounty on gopher pelts.

Walnut growers predict a fair to normal crop.

This year's apricot output it is predicted will break all tonnage records.

The Colorado River has passed its crest and irrigators along its banks breathe freely again.

Two canneries of the Hemet-San Jacinto Growers' Association are running on apricots.

The Yucaipa Apple Growers' Association is building a new packing house.

Yucaipa, San Bernardino County, has decided to hold an apple show next fall.

The army and navy want 3,000,000 cans of Southern California assorted jams.

Imperial County alfalfa growers are making a campaign on the alfalfa caterpillar.

It has been claimed that Los Angeles city will send out more than 500 farmerettes to aid in apricot harvest.

The Baldwin Park cannery will operate on tomatoes. It is contracting with the growers on the basis of $15 per ton.

San Bernardino County farm bureau now has 860 members in its 19 centers.

The regular annual meeting of the California Lima Bean Growers' Association was held at Oxnard, Tuesday, July 9.

Thos. C. Wallace, who has sold fertilizers for nearly a score of years to Southern California orchardists, died recently at the age of 62 years.

"Potatriots" in Orange County conducted a potato drive and found its 30 day consumption amounted to 205,000 pounds.

C. E. Sullivan, farm adviser of Imperial County, has resigned and left for the front on July 11. Assistant Farm Adviser Hertel has also resigned and entered the navy.

Members of Orange County farm centers recently held a farm center meeting at Fullerton, with adjournment to the Leffingwell Ranch where study was made of growing and packing lemons.

County Horticultural Commissioner Sharp of Riverside recently held a meeting with his inspectors and other county commissioners and discussed rodent control and other lines of horticultural work.

Colton maintains a "canteen" at its station from which free fruits and flowers are distributed to soldier boys who are daily passing through that railroad center. The fruit are contributed by producers in San Bernardino and Riverside Counties.

The Riverside County Dairymen's Association is protesting the ruling of the food administration ordering large shipments of dried sugar beet pulp to Eastern states. "We do hereby request that this beet pulp be offered for sale to dairymen of California before permitting shipment out of the state."

The Coast and General

California is making third cutting of alfalfa.

Don't shoot war pigeons; they may be army messengers.

Arizona was recently visited by extensive rains.

Arizona cotton is in bloom.

Idaho: "Rain is needed in all sections."

Washington reports that in most sections the winter wheat and barley will be fair crop. Harvest is already begun.

The spotted bean beetle is visiting the bean fields of Colorado, and an extensive spraying campaign with arsenate of zinc is recommended.

Some Eastern cheese factories are economizing by separating the butter fat from whey. They secure five pounds of fat from every 1000 pounds of whey.

With the almost impossibility of securing hemp from Russia and from Italy and of jute from India, the twine situation in this country is a serious one.

The commercial visible supply of wheat in the United States on June 1, according to the Chicago board of trade, was 1,146,000 bushels, as against 28,896,000 bushels the year before.

German regulations: "Poultry keepers are required to deliver to the government 40 eggs for each hen kept. The 1918 quota is due in September at fixed price of four cents per egg."

The 12th federal reserve district, which should have subscribed toward the war savings stamp fund about $8,000,000 monthly, subscribed only about $14,000,000 for the first six months of the campaign.

The 12th federal reserve district will produce 100,000,000 bushels of wheat, which is about 30,000,000 bushels greater than last year. Owing largely to weather conditions California will produce 6,000,000 bushels less of barley than last year.

A mysterious disease is visiting the cattle of Eastern Colorado. The cattle become totally blind and are unable to eat or drink. There is paralysis of the optic nerve and the tongue. The only way to save them is to feed artificially until fitted for market.

The director of the Gardening Union of Sweden has investigated as to lack of young fruit trees and has urged the Swedish public to save all fruit kernels which may answer for stocks for nursery trees. The country has depended in former years on Germany to supply these.

The forest service reports the lumber cut for 1917 as totalling 45,831,000,000 feet. The cutting of the immense amount called for the labor of 24,815 sawmills. The largest producer was the state of Washington with 4,500,000,000 board feet; Louisiana, second; and Oregon, third.

A decree has been issued in Switzerland which provides for compulsory crop production by all land owners. All lands must produce up to the average prior to 1914. All grain growers who fail to deliver the proper amount of grain "must pay four-fold the maximum price as indemnity for their deficiency"—and Switzerland is a republic too.

Canning Without Sugar

By W. V. Cruess

BECAUSE of the high price and scarcity of sugar for canning purposes there has arisen a demand for information upon methods of home canning by which the amount of sugar used can be reduced or by which the use of sugar is entirely obviated.

Sugar is used in canning to improve the flavor. It is not necessary for the keeping qualities of the fruit. Fruit is canned in very large quantities by commercial canneries in plain water without the addition of any sugar. This grade of fruit appears on the market as "pie fruit."

It is feasible to use several sugar substitutes or modify the process of canning in such a way that the amount of sugar needed is greatly reduced, and in some cases a very high grade product can be made without any sweetening. As a general rule, however, fruit put up without sugar is not so satisfactory as that canned in the usual way. The methods given below must, therefore, be considered as war emergency recipes and it is not expected that they will have any great value after the sugar stringency is over.

Pie Fruit in Water

Where such fruits as blackberries, loganberries, apples and other pie fruits are canned to be used later as fruit for pie making, it will not be necessary to add any sugar in the canning process. Prepare the fruit in the ordinary way for canning. Place it in the jars or cans; fill the containers with boiling hot water. If jars are used, place the rubbers and caps on the jars, but do not screw the caps down. It is a good plan to give the rubbers a preliminary boiling in a dilute baking soda solution to remove any objectionable flavors. Place the jars in a wash boiler sterilizer such as the one described in Circular 158 of the University of California agricultural experiment station. Add water to the boiler and bring the level of the water about half way up on the sides of the jars, heat the water to boiling point for 20 minutes with the lid tightly on the wash boiler. At the end of this time remove the jars and seal them. This fruit will keep indefinitely and can be used for pie making purposes. When made into pies it will be necessary of course to add sugar or honey or other sugar substitute. The amount of sugar needed in making the pie will be the same as in the process where the sugar is added to the fruit before canning, but this will distribute the cost of the sugar over a long period and the burden will seem easier to bear. This method, however, does not reduce the amount of sugar actually used in the end.

Use of Very Ripe Fruit

If fruit is allowed to become soft ripe on the tree it will acquire enough sugar on its own account to make it very palatable for canning without sugar. Soft ripe peaches, apricots and pears, especially, can be canned in a very small amount of water and will be sweet enough for dessert purposes. The method that has been found satisfactory is to place the prepared fruit in a pot with just enough water to prevent scorching. The fruit is brought to the boiling point and boiled for one or two minutes to cause shrinking. It is then packed hot in jars and sterilized at the boiling point for 15 minutes as described for pie fruit. Success lies in using very ripe fruit and in adding only the minimum amount of water. The preliminary boiling will force out the juice of the fruit, and the fruit is really canned in its own juice.

Use of Honey and Syrups

Corn syrup makes a very satisfactory sugar substitute for canning. For most fruits the syrup should be diluted about one half with water. In some cases more water is needed. For peaches, apricots, and berries, dilute Karo or other corn syrup with an equal quantity of water. For pears and cherries use two cups of water to one of the corn syrup. Pack the fruit in jars and add the hot diluted syrup and sterilize as directed for pie fruit for 20 minutes after the water has reached the boiling point. Honey and sorghum syrup can be used in a similar way. Honey is considerably sweeter than corn syrup and can therefore be diluted somewhat more with water. Honey, however, imparts its characteristic flavor to the product and unless the household likes this flavor it will be well not to can any great quantity of fruit in this way. Sorghum syrup, where available, makes a fairly satisfactory canning syrup, if diluted in the proportion of one cup of sorghum to about two cups of water. Sorghum, however, has a rather strong flavor, which would be apparent in the canned product but to many this flavor is very desirable. Other syrups can be used, but most of them are very much higher in price than cane sugar.

Use of Fruit Juices in Canning

Grape juice and apple juice have been used very successfully in university experiments in canning of fruits. The juice should be made from very ripe fruit. If apples are used, crush them as thoroughly as possible and heat them until soft; pressing out and straining the juice. If grapes are used, crush them thoroughly and press out the grapes without heating. Strain the juice as clearly as possible. The juice can be used in this natural state but it is more satisfactory if first treated with calcium carbonate or precipitated chalk. Precipitated chalk can be obtained from any drug store. To each quart of grape or apple juice add about one and one-half teaspoons of precipitated chalk. Heat the treated juice to boiling and strain through a jelly bag to remove the excess chalk. The precipitated chalk removes the acid taste of the juice and does not affect it in any other way. Prepare the fruit in the ordinary way and pack into jars and add the fruit juice. Sterilize as directed for pie fruit. This method will be of most use to home canners in the grape growing regions where grapes are cheap. It would not pay the ordinary home canner to buy high price grapes to use for this purpose. The juice from Muscat grapes imparts an extremely pleasant flavor to fruit canned in it.

Use of Baking Soda

Sugar is added to fruit mainly to disguise the tart flavor. The acidity or tartness can be reduced by the addition of a small amount of baking soda. For fruits of medium acidity about a quarter of a teaspoon can be added to a pound of fruit. For fruits of very high acidity as much as one-third or one-half a teaspoon can be used. The measurements are based on a level teaspoon; (the spoon must be leveled off with a knife edge and divided carefully). Do not use too much baking soda. The fruit must be placed in a pot with a small amount of water and the baking soda added. The fruit and water are then heated to the boiling point for a few minutes to facilitate the action of the soda upon the fruit. It will ordinarily be necessary to add with the baking soda a small amount of sugar or a sugar substitute. The use of the baking soda, however, does greatly reduce the amount of sugar necessary to produce the desired flavor. After treating in this way the fruit is placed in jars and sterilized as directed under pie fruit.

Can Home Products for Home Use

Unless home canners have a certain market for their goods, they are advised by the food administration not to attempt commercial canning. There are many difficulties in the way of disposing of small amounts of canned goods.

Home canned and preserved goods cannot be purchased or accepted as gifts for the army or navy. No governmental department is permitted to accept any article without paying for it. Supplies of this kind must be purchased in reasonably large units and must be uniform both as to ingredients and containers in order to simplify inspection and packing and guarantee the keeping quality of the goods.

However, every additional million jars or cans that are filled by housewives for home use will release an identical quantity of commercial canned goods for export. There will also be saved the labor, space on freight cars and cost of transportation that would mount up if factory-preserved foods had to be sent broadcast throughout the country, instead of being shipped in large blocks to cantonments or abroad.

Dry, can and preserve everything possible and store in every available container. If you have a surplus of produce or can put up a surplus of fruits and vegetables, share your surplus with others. Such sharing of foodstuff is not only neighborly and human but is true conservation, as it helps in the solution of the food and transportation problem. Housewives might well adopt and adapt the scout slogan; "Feed a Soldier's Family."

Storing Home Prepared Food Products

By W. V. Cruess

Cases have come to the attention of the university where home-prepared food products have spoiled because of lack of knowledge regarding their storage. The suggestions given below will be found useful.

Dried Fruits

Dried fruits should be processed by immersion in boiling water for one minute and draining before packing. If they become too moist by this process, dry a few hours in the sun after treating. The treatment is to kill insects and insect eggs. Store in insect-proof containers, such as tin boxes or heavy paper bags, or wrap in paper and store in sacks. Cloth sacks alone are not insect proof.

Dried Vegetables

Dried vegetables are more subject to insect attack than dried fruits. The method of processing given for fruits may be used, or preferably the dried vegetables may be heated thoroughly in an oven before storing in insect-tight containers.

Eggs

Where bran or sawdust is used for the storage of eggs that have been coated with water-glass, it should be dry and free from mildew or mold. The storage should be in a dry, cool place. Eggs preserved in this way keep perfectly but gradually evaporate and should be used within six months.

Vegetables in Brine

Cucumbers and other vegetables stored in brine should be well covered with the brine and effectively sealed with paraffine or other air-tight covering after fermentation is complete. This will check molding and softening. A barrel that can be filled with the brine and headed or bunged up makes a good container.

Jellies

In the warm sections of the state jellies frequently ferment. This is because they have not been boiled down sufficiently to preserve them. Under such conditions the jelly should be boiled down until it will boil at 220 degrees Fahrenheit or until it reaches 32 degrees Baume (or 60 degrees Balling) by the hydrometer test. See Circular 146 California Agriculture Experiment Station and Illustrated Food Preservation Leaflet II. Jellies may also be preserved when not boiled down so far as indicated above, if they are sealed hot in small jars with scalded rubbers and caps.

CALIFORNIA ANNUAL

The California Packing Corporation of San Francisco has issued an annual which gives the total pack, price and much other information regarding California canned and dried fruits, vegetables, nuts, beans, etc. There is much satisfaction in referring to this book, especially when it is noted that California's agricultural and mineral production, as indicated by one year's production, exceeds one-half billion.

A few items: Hay, $70,000,000; grain, $80,000,000; dried fruits and raisins, $47,000,000; citrus fruits, $48,000,000; canned fruit and vegetables, $58,000,000; one of the newest, rice, over $8,000,000; cotton, $9,000,000.

Orange Vinegar Instead of Apple Product in Citrus Regions

CULL oranges, usually allowed to decay, can be utilized by growers in the preparation of orange vinegar, a very high-grade product. It can be used by growers' families and throughout communities where citrus fruit is grown. Such communities are now supplied with vinegar made from apple waste or grain. Nearly all the citrus growing regions are so situated that this material has to be brought to them from some distance. There is no reason why orange vinegar can not be substituted wholly for the other products, according to specialists of the citrus by-products laboratory of the United States department of agriculture at Los Angeles.

Orange vinegar is easily made in barrel quantities and is sufficiently cheap to compete with cider vinegar where there is a difference of freight in favor of the orange product. The following process has been thoroughly tried out in the Los Angeles laboratory of the bureau of chemistry, and vinegar has been produced which expert buyers in the Middle West consider to be as good as the best grades of cider vinegar.

Use Kitchen Cider Press

The process best adapted for the production of orange vinegar in barrel lots is known as the "roller process." The juice should be pressed from the oranges in an ordinary cider press, or a kitchen fruit press can be used for the purpose. Strain out any large particles of fiber or peel that may be found in the juice and add to it a pint of brewers' yeast or a half dozen cakes of compressed yeast which have been softened in orange juice. The juice should now be set aside for several days in an empty barrel, keg or tub, and kept loosely covered with a cloth in order to keep the flies from it. It is best kept at a temperature of 85 degrees Fahrenheit.

As soon as fermentation has ceased (usually from three to five days are required depending upon the temperature at the time) the juice is again strained and is ready to place in the generator.

How to Make the Generator

To make the generator, use an ordinary vinegar or whiskey barrel, and so loosen the hoops that one head can be removed from the barrel. After this is done, build a small rack to fit into the barrel in such a way that throughout its entire length for about six inches below the bung a compartment in made which can be filled with beech wood shavings or corn cobs. A quick way to do this is to build a rack of slats three inches wide by one-half inch thick, these slats being set into grooved end pieces, about one-half inch space being allowed between them. At each end this rack is supported by a two by four inch piece cut in such lengths that the rack will be at least six inches below the bung. The two by fours are usually joined at the bottom by a cross piece one by two inches. After this rack is set in place and the compartment filled with cobs or shavings the barrel is reheaded and three one-inch holes are bored in each end so that the openings come just beneath the bottom of the rack holding the shavings or corn cobs. These holes should be bored so that they slant downward. In constructing the rack and fastening it to the two by fours, grooves or dowels should be used, or, if more convenient, hard wood pegs may be utilized to hold the rack together. Iron or other metallic nails should not enter into its construction. The capacity of a generator built in this way is from 30 to 40 gallons of vinegar.

When the generator is to be used for the first time, or after it has been standing idle for any length of time, it is best to scald it thoroughly before putting it in operation. This can be done by blowing steam into the bung or giving it a good washing in hot water.

Add Small Amount of Vinegar

After the water has been thoroughly drained out, add about a quart of good vinegar (cider, malt, or orange), which has not been pasteurized. Allow the vinegar to flow over the shavings and the inside of the barrel. Now add, through the bung, the fermented juice, close the bung tightly with its wooden stopper, and plug the holes in the ends of the barrel with plugs made of ordinary raw cotton. Several times each day, if possible, but at least once each day, remove these cotton plugs and replace them with wooden plugs. Turn the barrel over so that the bung is at the bottom and shake three or four times so that the juice in the barrel will come thoroughly in contact with the beech wood shavings or corn cobs. Roll the barrel back into its original position, remove the wooden pegs and reinsert the cotton plugs. An excellent vinegar is produced within the barrel, if this treatment is kept up daily and the temperature is above 80 degrees Fahrenheit, in from 60 to 90 days.

(We have asked the laboratory in Los Angeles regarding the securing of beech wood shavings and the necessity of any such substance, and we are informed that they serve an important function in aeration. The reason for using beech wood shavings is that they are a neutral substance, giving no flavor whatever. Corn cobs are practically as good, but, unfortunately, citrus sections have small supply of either beech wood or corn cobs. The laboratory informs us that the shavings of rattan are equally good—if they can be secured. Dealers in canners' supplies on the Pacific Coast have beech wood shavings in stock. Red wood or pine shavings will not answer.—Edit.)

When the material is sufficiently acid, remove from the barrel, place in clean glass bottles, and keep tightly corked. Little difficulty is experienced in keeping this product, but it is readily sterilized and made easier to keep by heating the bottles in boiling water for 15 to 20 minutes. No sediment will deposit in the bottles if this treatment is given. Where such sediment does appear, it is best to pour off the vinegar gently and sterilize as directed above.

FARM LOANS

During the month of May 9,530,791 was loaned to farmers of the United States by the federal land banks on long time first mortgages, according to the monthly statement of the farm loan board. The federal land bank of Spokane leads in amount of loans closed, $1,511,470. The other banks closed loans in May as follows: St. Louis, $1,209,650; Houston, $1,138,716; Omaha, $1,020,800; Columbia, $916,905; New Orleans, $753,500; Wichita, $639,100; Louisville, $560,600; Baltimore, $508,600; Springfield, $465,150; Berkeley, $436,600, and St. Paul, $369,700.

On June 1 the total amount of mortgage loans placed since the establishment of the federal land banks was $101,376,378, covering 44,765 loans closed, as against $91,951,886 on April 1, covering 40,451 loans closed. During April 4969 applications were received, asking for $14,001,733. During the same period 5260 loans were approved amounting to $12,029,137. Altogether 131,599 have applied for loans under this system, aggregating $313,947,568.

The total amount loaned by Berkeley is $6,230,200.

The Avocado in Guatemala

In the report of the California Avocado Association for 1917 appears an account of Exploring Guatemale for Desirable New Avocados, written by Wilson Popenoe, agricultural explorer of the U. S. D. A. This has been deemed of sufficient interest to demand reprinting, and an exquisite illustrated booklet is now issued. It is of 44 pages, has many half tone illustrations and more of drawings of different types of avocados. Cultural and marketing methods in Guatemala are given in the first two pages of the book, and later is given a long list of varieties introduced for trial. This list is accompanied by the drawings referred to which were made by Robert N. Jones of the office of foreign seed and plant introduction.

Regarding the culture of the avocado in Guatemala Mr. Popenoe says: "So little cultural attention is given to avocados in Guatemala that it is scarcely necessary to touch upon this subject. Experience obtained in California and Florida is a better guide than the observed practices of the Guatemalans, because the latter make no systematic effort to meet the tree's cultural requirements. The method followed in cultivating coffee plantations in Antigua has been recommended for avocados in California, but I do not know what success will result from its application. It consists in clearing the ground two or three times a year with a hoe, but never cultivating deeply. The avocado trees which grow among the coffee bushes in Antiguan plantations certainly appear healthy and vigorous, but it does not necessarily follow that this method of cultivation is the best. They might even be more healthy and vigorous under another."

Fumigation Demonstration

Through the efforts of H. A. Miller, chairman of the Covina farm bureau, and J. L. Matthews of the Covina Argus, the demonstration of practical fumigation at Covina on Saturday, July 20, most certainly looks like a success in advance.

All the citrus growing communities of Southern California are being thoroughly apprised of the importance of this meeting, and there will probably be one of the largest meetings from point of attendance that has ever been arranged within the county. Arrangements are being made for the accommodation of the visitors at a noon meal.

The principal demonstrations will be held in the afternoon, beginning at two o'clock on the high school grounds. A large amount of fumigating apparatus has been secured, and with the aid of Dr. J. Eliot Coit, Dr. H. J. Quayle and other leaders in citrus culture, the practical work will be shown. How to operate a liquid gas machine will be shown in every possible way. The demonstrations will be made by practical fumigators, while the lectures will be given by Dr. Quayle.

The principal reason for the holding of this demonstration at this time is to get the ranchers themselves to learn how to generate hydrocyanic acid gas. The coming season is most assuredly going to show up a lot of scale, and there is a scarcity of experienced labor. In all probability a large amount of fumigation done this year must be done by the ranchers themselves. Everyone interested is invited to spend the day at Covina on July 20.

The Spread of the Farm Loan

By Frederic J. Haskin

There are now as many national farm loan associations as there are counties in the United States. This means that 3003 associations have been chartered by the federal farm loan board during the first year of actual operation of the 12 federal land banks. It does not, of course, mean that there is an association in every county, for not all counties are agricultural.

These associations have a membership of about 50,000 farmers, and to these men nearly a hundred million dollars have been loaned by the federal land banks. That means that in this time of food scarcity the national government has been the means of putting into the hands of the farmers who produce the food one dollar for every inhabitant of the nation. There is no place where the investor's dollar could do him more good just now.

The distribution of these farm loan associations over the map of the country is irregular, showing that the credit offered by the federal land banks flows where it is needed, acting as a regulator of interest rates, and supplementing other banking facilities where they are inadequate. In such states as Ohio, Iowa, Illinois and southern Wisconsin, where land values are high and well standardized, and where the wealth of great cities is near at hand, the farm loan associations are few. Nevertheless, the farm loan system has not been without influence even in these regions of prosperity, for there has been a decrease in the interest rates charged by the established mortgaging concerns.

A farm loan may be as small as $100 and can not exceed $10,000. The average size is $2270. There is now a vigorous agitation to have the limit raised to $25,000, as a $10,000 loan is too small for the purposes of many farmers, and the limit has checked the spread of the farm loan system in a few of the best farming regions in the country.

The average number of members in a farm loan association is 17. The minimum allowed by law is ten. Some of the associations have from 40 to 80 members.

There is no slowing down in the rate at which new associations are being formed, for the board has issued 60 new charters during the past month.

Book Review

INJURIOUS INSECTS AND USEFUL BIRDS

"Injurious Insects and Useful Birds, Successful Control of Farm Pests," by F. L. Washburn, professor of entomology, University of Minnesota, published by J. B. Lippincott Company, Philadelphia, $2.00 net.

This is a magnificent publication of 454 pages, 431 engravings, most of them photographic engravings, four color plates, and a great fund of information regarding entomology, with special reference to the practical or economical side. It is intended as a desk book and a reference book as well. The suggestions contained are largely the results of 21 years of work in economic entomology by the author. Yet in so large a field one must of necessity have recourse to much experience not his own, and the author has not hesitated to obtain desired information from many reliable publications; such as bulletins and circulars from the United States department of agriculture, bulletins from the Geneva and the Cornell stations and from all sections of the country. There are 21 chapters touching upon such subjects as Loss to Agriculture; Farm Practices to Lessen Insect and Rodent Injuries; Structure of Insect; Collecting and Preserving; Insecticides and Spraying; Fumigation; and other chapters touching upon insects injurious to various fruits and crops. The Relations of Birds to Agriculture is a chapter to filled with almost as much value as other chapters relating to insects.

ALFALFA GROWERS EXTENDING ORGANIZATION

J. L. Farrar, who has been manager of the Riverside Alfalfa Growers' Association, has tendered his resignation and will push the campaign for a state wide association of the California Alfalfa Growers' Association. In this association there are now 10,000 acres represented in the membership. It is hoped to increase this to 25,000 acres by the first day of August.

Tulare County is making a special pull for securing 100 per cent of its alfalfa growers in this association. The idea is that this association shall watch the interests of the alfalfa growers and extend the market for California's wonder crop.

Correct Lubrication for the "L"-Head Type Engine

This, the "L"-Head type of automobile engine, like all *internal combustion engines*, requires an oil that holds its lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. ZEROLENE fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude*

"Proven Entirely Satisfactory"

Only perfect satisfaction can account for the use of ZEROLENE by the majority of automobile owners.

Leading coast distributors also testify that it is "a most satisfactory motor oil."

They know from the records of their service departments—and we know from exhaustive tests—that Zerolene, correctly refined from selected California asphalt-base crude, gives perfect lubrication with least carbon deposit. Get our lubrication chart showing the correct consistency for your car.

At dealers everywhere and Standard Oil Service Stations.

STANDARD OIL COMPANY

Grape Standardization

PACKERS and growers of grapes, county horticultural commissioners and officials of the state horticultural commission attended a conference called at Merced June 27 by State Commissioner of Horticulture G. H. Hecke. The purpose of this meeting was to discuss the provisions of the fresh fruit standardization law as applied to grapes and to outline and recommend for adoption the best, most uniform and adequate means for enforcing and applying the same to the output of the present season. It was found last year that different methods of standardizing grapes were used in different counties, and it was to provide the means to remedy this situation that this conference was held. State Viticultural Commissioner E. M. Sheehan was present and acted as the representative of the viticultural commission.

The conference was opened by Commissioner Hecke, who gave a brief summary of the results of the first season of standardization as applied to other fruits. The maturity standard of oranges, apples and pears has been noticeably improved, as is evidenced by the reports received from many of the larger markets. The profits resulting from the standardization of fruit are shared by both grower and consumer, the grower receiving better prices when the reputation of his fruit is established for high quality and uniform pack, and the consumer not being obliged to buy wormy or inferior fruit.

From the discussions which followed it was evident that serious consideration had been given this subject by all those concerned. The conclusions, placed in the concrete form of resolutions and adopted by this conference, will unquestionably result in great improvements in the work of standardizing the 1918 grape crop. The following resolutions were adopted: That every county horticultural commissioner instruct his inspectors to hold up and condemn any grapes or picking boxes showing any indication of honey dew or mealy bug; that all grapes, except Emperors and Cornichons, shall when packed be practically free from stem mildew and in no case shall infection exceed three per cent; that the test to determine the maturity shall be made from the greenest grapes.

Fresh Fruit Standardization

THE requirements of the fresh fruit standardization act as applied to packed fruit are summarized by the state commission of horticulture as follows:

All fruits must be practically free from insects and fungus diseases. In addition:

Cherries must be well colored and practically uniform in size, quality and maturity.

Peaches, apricots, pears, quinces, plums, prunes, tomatoes must be practically uniform in size, quality and maturity.

Grapes (table) must be practically uniform in quality, well matured, with a sugar content of 16 to 17 per cent.

Berries must be practically uniform in color, quality and maturity.

Cantaloupes must be fully netted, of uniform size, firm, mature, free from bruises, and practically free from aphis, honey dew and other defects.

Oranges must be substantially colored, not immature or frozen, sugar content eight to one.

Box Marking Requirements

Name and address of packer or orchard.

Name of variety. When not known must be marked "unknown," or if more than one variety is packed must be marked "mixed varieties."

Minimum weight.

Number of peaches within four.

Containers not standard when packed must be marked "irregular" and in the case of grapes must have the actual gross weight stamped thereon.

Standard cantaloupe crates must be marked "standard."

Apples

Grade marked "California Fancy" must be well grown, properly matured, of one variety only, hand picked, stems retained (except Gravensteins), well colored for variety, uniform size (variation three-eighths inch in smallest diameter allowed), well packed, free from insect pests and diseases (three per cent of any one defect, ten per cent total defects allowed), visible rot, dry rot or Baldwin spot, insect bites, bruises (except those necessarily caused in packing), sunburn and other defects, virtually free from dirt.

"B Grade" must meet same requirements except that all varieties may be packed with stems removed, need not be well colored for variety and slightly frost marked or sunburned apples will be allowed.

"C Grade" same as "B Grade" except that apples need not be well grown, hand picked, or uniform size, well packed, or be free from insect bites, bruises, frost marks, sunburn and other defects or dirt.

Box Marking

Stamps designating grade may be purchased from state commission of horticulture at one-half cent each. State inspectors are paid from fund accruing from sale of these stamps. When state stamps are not used the same grade requirement must be met and boxes stamped with proper grade in letters not less than one-half inch high.

Number in box, or net weight. A variation of five apples more or less than the number stated shall be allowed.

Variety. If variety is unknown the statement "variety unknown" must appear on box.

Name and address of packer, either first pack or repack.

Date when packed or repacked.

No misleading statements.

Apples which do not conform with the packing requirements may be sold in bulk to by-product factories or consigned to a packer for packing.

BACK NUMBERS OF CULTIVATOR

Any subscribers of the California Cultivator who may have the complete file and do not desire to keep every number prior to the year 1911, may find means of disposing of these numbers by writing to the public library of Pomona. The library, on checking up on its own files, finds many copies missing, which this office can not supply. Write to Librarian, Pomona Public Library for information as to numbers desired.

Dual-Purpose Plants

Written for California Cultivator By Ernest Braunton

THE recommendations so often made in this department for wider use of dual-purpose plants are at last bearing good fruit. From far and near come reports of intending planters of home grounds choosing ornamental trees, shrubs and vines that bear edible fruits. Several plant dealers have stated the demand for this class of plants is growing fast.

There is no doubt that Americans are and have been the most extravagant nation of all. Easily acquired virgin soil of the highest fertility caused the first settlers of this country to become prodigal in the use and disposition of agricultural products. I can remember instances of farmers who could not secure the fancied value of their corn crop calmly burning it up for winter fuel. Today the federal government would restrain them from such destruction of anv crop. The ease and low cost of production, coupled with bountiful yields, started even the usually staid and conservative farmer toward waste. The manufacturer of early days had an equally successful career, unhampered by keen competition, labor troubles, etc., incident to later days.

Now are we facing the problem of acute conservation of all foods and the elimination of the unnecessary. The latter I hold includes all plants that have merely ornamental value where a fruiting plant of equal value and similar gross appearance may be had. The classes may be well illustrated in the comparison of magnolia and avocado. I can conscientiously affirm that I have seen avocado trees that are as handsome in every way as the best magnolias. Some little consideration must be given the magnificent flowers of the latter, especially when cut from the tree, but the blossoms left on the tree are not so striking and the crop is never large enough to readily call attention to the tree, as is the case with some of flowering trees where the bloom almost hides the foliage. The magnolia needs a wet soil, being a lowland or near-marsh tree. The same amount of water necessary to successful growth, if applied to an avocado, would induce a bountiful fruit crop and a most handsome growth of foliage that would successfully meet the criticisms of all captious fault-finders. I could as easily find subjects that would fill a page of matter in the use of guavas, eugenias and carissas for hedges, and these and others of splendid appearance and good fruit such as the feijoa or Paraguay guava for shrubbery masses. For vines we could use the edible passion vine fruits, chayotes, evergreen blackberries and evergreen raspberries and a long list easily compiled. Let us have only two-purpose plants.

Use of Dead Trees

When a tree of good size dies, as trees are wont to do, study out some means of using the trunk and top in the construction of some kind of arbor or covered seat. In my own yard I had a large Monterey pine pine away. The trunk was cut off about ten feet from the ground, the top was utilized for the frame of a mushroom roof thatched with fan palm leaves. It has attracted much notice and favorable comment. Passers-by have called to examine its construction and to photograph. I shall take a snapshot at it and may prevail on the editor to illustrate a descriptive article. It shelters an octagonal seat 18 inches wide. In the meantime, do not cut such trees off at top of soil or grub them out unless ground is needed, and much needed for cultivation or other good use or uses. Let us look somewhat to comfort, convenience and outdoor attractions.

Shaving Palms

The question is often asked how best to clean palm trunks when found necessary. Personally, I do not like doctored palms, but it is sometimes quite advisable, not so much with fan palms but almost necessary with some date palms. Fan palms should have the old or dead leaves cut off but the leaf-bases should be left until they fall away or may easily be pulled off with the hands. Not so with the date palms or phoenix. The bases of these leaves sometimes persist on the trunk for a half century. In the fan palms these are short, shallow, and dry. In the date palms they are both long and wide, also thick, and behind them is a pocket filled with rotting fiber, snails, slugs, wood-lice, worms, borers, ear-wigs, and a variety of insects of all kinds as well as fungous growths. In my yard I had to "shave" a trunk to get rid of great masses of mealy bugs. The best weapon for such warfare is a sharp ax.

Response of Seeds

It is very interesting to note the ways in which seeds are elastic in their response, dependent upon age and other conditions. For 40 years I have been sowing seeds. For 14 years I have sown, each year, except the last two, large quantities of gladiolus seeds. These have been sown within a few months of harvesting and the response has been quick and voluminous, for I know how best to treat them. Recently I have sown a lot of seeds saved in 1916 and therefore two years old. I can affirm with absolute certainty that all these seeds have taken at least twice as long to germinate as one year old seeds and the response in numbers has thus far been very poor. After weeks of constant good care the tiny plants are still appearing. I could well have believed, based upon a broad experience with seeds, that all not showing ere this would have rotted. If planted earlier, in cool spring, they would have done so. Only warm soil has preserved them. Unless they finally respond with a better crop I shall conclude these seeds are not profitable to hold more than one year. This lesson is valuable as being illustrative of the action, or lack of action, of many other kinds of seeds.

A Fine Shrub

After years of observation I am more fond than ever of the abelia. As a small, neat, flowering shrub of cleanly habit and general appearance it has few rivals and no superiors. Its growth is usually about three to four feet and it bears heavy crops of dainty blush-white little bells. It thrives in any soil with little care.

JULY SCHEDULE GLENN COUNTY FARM BUREAU

15 and 16, Willows, night meeting 15; 17, Chrome, night meeting 17; 19, Plaza, night meeting, 19; 20, directors' meeting at Willows, 10 a. m.; 24, Elk Creek, day meeting 2 p. m.; 24, Grapevine, night meeting 24; 26, Larkin, night meeting 26.

Ord, first Wednesday in each month; Bayliss, first Friday; Codora, second Monday; Orland, second Wednesday; Jacinto, second Friday; Willows, third Monday; Chrome, third Wednesday; Plaza, third Friday; Elk Creek, fourth Wednesday, 2 p. m.; Grapevine, fourth Wednesday; Larkin, fourth Friday.

Directors meetings for July in the Sacramento Valley district are as follows: 15, Colusa County; 16, Sutter County; 17, Butte County; 18, Shasta County; 19, Tehama County; 20, Glenn County.

Mothers of Boys Should Know

That Boss of the Road Overalls are built to stand the hardest knocks of work and play. Genuine, indigo-blue denim that takes the tub test and comes up smiling; "stay-there" seams that can't rip out; big, man-like, *swinging pockets;* hold-fast, patent buttons; reinforced strain points—all the features that make Dad swear by *his* Boss of the Road Overalls.

All of which explains why, in these thrifty times, it is good economy to buy Boss of the Road Overalls.

If you don't know what we mean by *swinging* pockets—your dealer will gladly show you.

Look for the Bull Dog on the label. It is your protection. Never has this trade mark meant so much to you as it does today.

Buy them from your local dealer

NEUSTADTER BROS.

San Francisco Portland

MARTIN!

KING OF DITCHERDOM

Built for farm use. Equally successful for drainage or irrigation ditches. Fine for terracing and levee work. Cuts the toughest alfalfa or sweet clover roots without plowing. Leaves the ditch with smooth, hard banks. Works in any soil.

IT DOES THE BUSINESS

10 DAYS TRIAL

The name **Martin** on a ditcher is an assurance of satisfactory field work. It is significant that most Martins now go where others Martins blazed the trail. Each machine sells another—and the reason is

All Steel Reversible-Adjustable

No wheels, cogs or levers. Made in 2, 4 and 6 horse sizes. Large size fine for tractor use.

Popularity and True Merit

The Martin always has been and always will be sold **on its merits** and under a guarantee of satisfaction. More **Martins** are now in use than all other farm ditchers combined, and the facts stated in this advertisement tell why.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tanning Leather

What is best method of making leather?—Subscriber.

Like learning a trade, getting rich and some other things, the tanning of leather requires some experience and attention to details. In a word, however, here are a few hints:

The skin should be salted on the flesh side as soon as the hide is cooled after removal, using 10 to 12 pounds to a full-sized skin. After salting roll the hide tightly. When ready for tanning place the hide in "soak", simply water to remove blood and salt. After being left in this 24 hours the tail and feet may be cut off and the flesh adhering scraped off, after which the hide should be placed in lime water. To make the lime solution take a bucket of water to each quart of lime. When thoroughly slaked and mixed, immerse the skin and allow to lie for three to four days. Thoroughly wash in cold water. Scour and pound in good soapsuds for half an hour, after which take white vitriol, alum and salt, one tablespoon each to skin, and dissolve in sufficient water to cover skin. Let remain in this 24 hours. Wring out and dry. To soften, oil with neat's foot oil or currier's oil. It may again be washed out in soapsuds and hung up until nearly dry, when it should be worked and softened. If it should remain hard and refuse to soften, repeat the soaking in suds.

This will give a raw hide which may answer. However, if it is desired to have the leather more perfectly tanned, after ringing out of the suds and before oiling, place in vessel and take of sufficient water to cover, in which has been thoroughly mixed one pint of this mixture. "For a 12 pound calf skin take terra japonica, three pounds; common salt, 2 pounds; alum, one pound. Put these in a copper kettle with sufficient water to dissolve. Boil." Pour the water above referred to, which has been mixed with a pint of this mixture, over the skin. Every 12 hours take out the skin and add another pint of the tanning mixture. Do this three days, then add the entire amount which has been left of the tanning mixture. If it is desired to darken the leather add one pound of Sicily sumac. Of course the leather should be handled often in this mixture. In addition the drying should be gradual and working with the hands as it becomes nearly dry aids in stocking the leather.

Alsike Clover

I understand alsike clover is good bee food. Is it adapted for this southern country and would the returns in hay be as good as alfalfa? How much seed to the acre is required?—Subscriber, San Diego.

In moist and cool sections alsike or Swedish clover does fairly well. While it makes a good bee pasture the great number of crops secured from alfalfa makes it also a leader as a bee pasture. Alsike produces a fine hay and one which is particularly liked by live stock. However, it would not in any sense be equal to alfalfa under California conditions. The amount of seed per acre varies from 8 to 15 pounds.

Bloody Egg Shells

Within the last three months we have lost more than a dozen hens. They lay very large eggs, and nearly every day there will be two or three bloody ones. Sometimes I have seen the blood drop quite a bit.—Subscriber, San Dimas.

Blood on the outside of the egg is due to the rupture of a blood vessel in the oviduct. In this case the rupture is probably quite near the vent and is caused by the strain of laying such large eggs. Leghorns do not usually lay extra large eggs. Doubtless yours, like many others in California, have Minorca blood. It is quite likely that the mash is too forcing, that is, contains stimulants or such a large proportion of animal meal that the hens are forced to lay more eggs than is good for them. If you will make the mash bulkier by mixing it for a while with an equal quantity of bran you may not get so many eggs but you will see less blood. Compel the hens to consume less mash by closing the hoppers part of the day, and give all the greens they will eat. —J. A. K.

Two Year Old Hens

We have White Leghorns that have laid now two years nearly. With feed high as it is, they will not pay a third year will they? Would you sell them and put the money into pullets? Our hens all lay large eggs. We had a half dozen cases of bowel trouble—our first sickness. It was offensive and they soiled their feathers and some pulled them. Only one died. Of course I isolate these. They are about well. We feed a (supposedly) good mash, "milo" or kafir for scratch, shell, charcoal, plenty of green clover, alfalfa, etc.—Subscriber. San Dimas.

Do not be in a hurry to get rid of those two year old hens. They may be your best layers. Experiments at Davis have shown that a hen frequently lays more eggs in her third year than in her second. Look your hens over carefully this summer and try to select the poor layers by color of shanks, condition of plumage, etc. When you are satisfied a hen is not going to be profitable it is time enough to get rid of her. I think the bowel trouble in your flock is probably due to either the quantity or kind of beef scrap in the mash. Making it bulkier will help this as well as the other trouble. If the mash contains stimulants as some of these patent mashes do, better try something else. — J. A. K.

Figs Suckering

Can you tell me how to prevent shoots coming on fig roots? Have a few Smyrnas which are thrifty, full of fruit, and have low crown. — Subscriber, Hemet.

There is no better way than making clean cut, and if the work is carefully done the suckers will ultimately lessen, and perhaps cease to appear as the tree grows older.

Fruit Harvesting Prices

What are farmers prices for picking peaches in the usual 40 pound orchard boxes?—Subscriber, Exeter.

Mr. Kane of the department of standardization and inspection of the California Peach Growers' writes: "The peach season has not as yet started in this section, but general opinion seems to prevail among the growers that the price for picking peaches, by picking boxes, will be five or six cents."

Humus

What is humus? — Subscriber. Hueneme.

As usual the International Dictionary affords some excellent reading, and the best answer we can give to this question is as follows: "Humus is a brown or black material formed by the partial decomposition of vegetable or animal matter; the organic portion of soil. It absorbs moisture and ammonia from the air and is an important constituent of the soil, although it is not, as was formerly supposed, the principal source of carbon for growing plants. Humus appears

SAMSON SIEVE-GRIP TRACTOR
GMC TRACTORS GMC TRACTORS

10 H P on the Draw Bar—25 H P on the Pulley

The Samson Sieve-Grip Tractor embodies all the features which years of painstaking effort and experience have approved. It is not an experiment. It is a demonstrated success of years' standing. Its enthusiastic owners are numbered among nearly all civilized nations on the globe.

In construction, it is very simple. In strength, all that its name implies. Built to meet the most exacting demands, day in and day out.

Its Sieve-Grip Wheels, skeleton-like in construction, give greatest traction with least weight. They do not slip. They do not pack the soil. They assist cultivation.

Its Nodust Molsto-Rizer cleanses all air entering carburetor and crank case vent. All working parts of the motor are protected from dust and grit.

Its Lubricated Roller Pinions reduce friction to a minimum. They deliver maximum power to the draw bar.

Its ball and disc type Governor assures simplicity of operation and prevents racing of the motor. Adjustment, made from the driver's seat, secures any desired set speed regardless of load, to the tractor's maximum capacity.

We court the most rigid investigation.

It will be our pleasure to give you a demonstration at any time, without obligation on your part.

Ask an owner or write us for information.

Scenes of Prosperity

are common in Western Canada. The thousands of U. S. farmers who have accepted Canada's generous offer to settle on homesteads or buy farm land in her provinces have been well repaid by bountiful crops of wheat and other grains.

Where you can buy **good farm land at $15. to $30. per acre—get $2. a bushel for wheat and raise 20 to 45 bushels to the acre** you are bound to make money—that's what you can do in Western Canada.

In the provinces of Manitoba, Saskatchewan or Alberta you can get a

Homestead of 160 Acres Free

and other land at very low prices.

During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to the acre. Wonderful crops also of **Oats, Barley and Flax. Mixed Farming** is as profitable an industry as grain raising. Good schools, churches, markets convenient, climate excellent. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

GILBERT ROCHE
3-5 First St., Sheldon Block
San Francisco, Cal.
Canadian Government Agent.

to be a complex and varying mixture; its chemistry has not been thoroughly worked out. According to some, black humus consists of a weak acid, humic acid, which is soluble in alkalies, and humin, which is insoluble; similarily, brown humus is said to consist of ulmic acid and ulmin. Other supposed constituents of humus are crenic acid, apocrenic acid, geic acid, gein. Humous substances in solution are important solvents of rocks."

In other words humus is the whole life of the soil.

Liver Trouble of Turks

My turkeys get liver trouble at three or four months old. I feed baked corn bread, cracked corn, alfalfa and all the sour milk they can eat.—Subscriber, Owensmouth.

That trouble with the liver is proof that they have been overfed. Nearly all young turkeys die in this way, and always from the same cause, overfeeding. You cannot do much for those that are already sick, but I should cut down the ration of the well ones to green feed and sour milk with a little rolled oats chopped with the green feed once a day. When they all seem perfectly well you can begin giving grain again, but only a little, and try to give some other grain in addition to corn.—J. A. K.

Cabbage Worms

Is there a better way to rid cabbage of the small green worms than hand-picking? I have 60 nice plants but all at once they were covered with tiny worms, same color of cabbage. They did have lice but I thought I got rid of them.—Subscriber, Oxnard.

A strong dose of Paris green or arsenate of lead is best. The poisons do not injure cabbage plants. Mix with a little strong soapsuds, then add water so as to make strength of about one pound arsenate to 12 gallons water. There is no danger of carrying this poison to human beings. However, if one is timid about using a poison then use white hellebore one ounce to three or four pints of water.

Horse-radish Roots

Please tell me when to dig or use horse-radish roots. I have very nice looking plants, but when I got to use it the roots seem to be woody and have no taste at all.

There must be something wrong with your stock. It sounds like parsnips. Get a new start for good horseradish should have genuine "taste".

Small Insect

We have a small insect here that makes holes in the leaves of the plant and kills it. It is a dark brown insect and jumps like a flea but is soft and not hard like a flea.—Subscriber, Hueneme.

In a case like this if our inquirer will inclose in a pill box or small pasteboard box a few leaves with some of the insects on them or give more definite description we can answer far more intelligently. The June bug, prevalent about this time of the year, is noted for "eating holes in leaves". The leaf hopper, vastly different in size and habits, still may be a brown insect; does not eat holes in the leaves but does destroy the leaves so they drop off. The former is controlled by the use of poisons; the latter by oil emulsion. Be as explicit as possible and the Cultivator will try and make definite suggestions and answers.

Root Knot

Would like to know if I can plant new tree in the same hole where another tree with root knot has stood. Tree with root knot is not more than a foot deep in root in the ground. My intentions are to dig up all such trees, dig out the hole well, remove all this ground and leave it open to the sun and air all summer, and when I set new trees fill out with new dirt. Would that be all that is necessary or must I put some disinfectant in the hole to be sure all germs are destroyed?—Subscriber, Lemon Grove.

Disinfection of ground is almost impossible wthin economic bounds, but the steps suggested, followed by the planting of a tree free from root knot, with clean cut root ends and with no bruises on roots to permit entrance of disease germs, probably would result in bringing trees free from the disease. Unfortunately the germs of crown gall are in nearly all soils, and only care and attention can reduce its ravages.

Book Review

YEAR BOOK 1917

The Year Book of the United States department of agriculture for 1917 contains the usual report to congress made annually by the secretary, and in addition the nature of the work of the department during the year of 1917. These take only about 100 pages of the 850 page book, the remainder being given over to articles on the Peanut Industry, The Keeping of Records by the Farmer, Danger of Introducing Fruit Flies, Weed Problems, The House Rat, How the Dairy Cow Brought Prosperity, Good Roads, Cold Storage, The World's Supply of Wheat and, least interesting in appearance and most interesting when given study, the pages given over to statistics. Agriculture has advanced by leaps and bounds during the past year.

The Fruit Fly discussion is by E. A. Back and through the statements made, and especially by the use of half tone engravings, conveys graphically the danger to the fruit industry of the United States through possible introduction of this pest. Some of these photos were taken by Mr. Back in the California quarantine work.

Subscribers of the Cultivator should write to one of the California senators or to the congressman from the district in which they live and ask for copy of this publication.

War is our business; we can't win by carrying it as a side line.

THE SLACKER

If you have an idle dollar
It's a slacker,
Take it firmly by the collar—
It's a slacker.
Make it battle for the nation,
For a dollar on vacation
In the present situation
Is a slacker. —Exchange.

Four Row Bean Cultivator

For Tractor or Teams

Killefer Quality

Conserve man power—One man cultivates four rows of beans as easily as two with this tool.

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply controlled cultivator, capable of doing their work deeper and better than possible with the lighter tools. The frame is one piece of high carbon steel without joints to work loose or sag and hold the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the four rows and the foot control is very easy on the driver.

Built to cultivate any width row from 20 inches to 36 inches wide.

Specify Width Rows When Ordering

The Killefer Manufacturing Co.

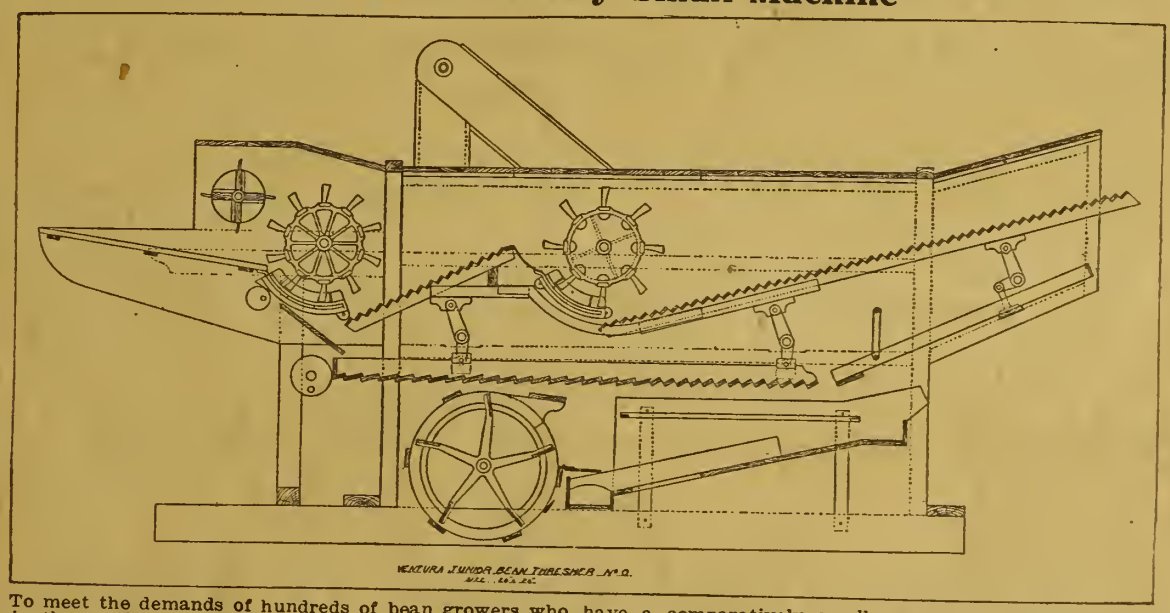
Two Men Can Thresh Beans With This

Don't Risk the Loss of a Valuable Bean Crop by Rain When You Can Get a Satisfactory Small Machine



To meet the demands of hundreds of bean growers who have a comparatively small acreage, too small, perhaps, to obtain the services of threshing outfits employing 40 or more men, we offer the Ventura Junior No. O Bean Thresher, a thoroughly practical and satisfactory small machine that can be operated by only two men. It is made on the same principles as our larger machines that have given satisfaction in California for the past 22 years and will thresh every variety of beans. Can be operated by tractor or gas engine and easily loaded and moved from place to place.

It is sold mounted or unmounted and with or without gas engine. This thresher is equipped with cylinder teeth as found by experience to be far superior to machines made elsewhere equipped with round iron pegs for teeth. The cylinder teeth in the Junior O can also be equipped with clips,—special Ventura devices for quick accurate adjustments.

We make six sizes of bean threshers. Write us regarding bean threshing machinery, stating what acreage and power you have and in what capacity machine you would be interested.

Our manufacturing facilities here are such that we offer our customers superior service as compared to service from the east necessitating long freight hauls on heavily loaded roads. If you want a bean thresher it would be prudent to order early and order where you know delivery can be made and where parts can be obtained on short notice.

The Ventura Manufacturing and Implement Co.,
Ventura, Calif.

Try Smoking Fish at Home

LAST summer when the big runs of mackerel were tempting fishermen on the southern coast it occurred to many housekeepers that it was possible some of the extra fish—after the family and neighbors had eaten till they could no more—might be saved by salting and smoking to help out with the meat bills, etc., etc., which are with us day and night.

Experiments were made—most of them successful. Mackerel and other fish were salted down or smoked and laid by for the following months. This year more people will take advantage of this plan. For the convenience of those interested the Cultivator gives the following instructions as to making of simple smokehouse and method of cleaning, preparing and smoking the fish:

In nearly every locality there are fishes of good food quality that seem to find no place in the ordinary domestic economy merely because they have not the most approved flavor or texture when prepared in the usual manner or because the bones are found troublesome. Among these are the bowfins, mooneyes, buffalofishes, carps and sturgeons. Yet these fishes, when cured by the simple process of smoking, are of excellent flavor and may be kept several weeks if protected from mold. As a result of smoking, the flesh acquires a firm texture that makes the removal of bones much easier than in the case of fried, baked or boiled fish.

Most persons like smoked fish. Others find it an easy taste to acquire. A word of caution should be offered. Do not judge smoked fish by the hastily, carelessly prepared product that some fishermen are willing to sell. A couple of hours' hard smoking under improper conditions may make a "smoked fish" in appearance but not in fact. Again, fish are sometimes smoked with excessive and long-continued heat until the product is dry and unattractive, and edible only when cooked. The smoking operation is simple, but thought, care and observation are required to get the most desirable results. Try smoking your own fish if the opportunity occurs; it is an interesting experience.

Construction of the Smokehouse

The smokehouse has four sides and a detachable top. The earth is the floor. The dimensions are three feet six inches by three feet six inches by seven feet high, inside measurements. The house is made of five sections—the front, back, two sides and top. Each section is separately made of two by two inch redwood lumber, covered with 26 gauge galvanized iron or painted sheet iron. The sections are held together by four one-fourth inch by four inch bolts at each vertical edge. A detachable cover is made to fit over the top of the house, one-fourth inch larger than the house. The door, two by five feet, is swung on three hinges on the front section, with its lower edge eight inches from the ground. The draft is regulated by an eight inch circular galvanized iron plate, pivoted to cover a six inch hole cut in the door. The hole in the door, which is hereafter referred to as the draft port, is flanged to prevent cutting and scratching the hands and arms.

Six inches from the top, on each side, are six one inch holes covered with slides having corresponding holes, which may be moved to regulate the outlet of smoke and steam. Corks may be used instead of the slide. On the inside of the house two one by two inch strips are nailed, seven inches and 20 inches, respectively, from the top. These strips are supports for the rods from which the fish are suspended by S hooks made from No. 10 galvanized iron wire, or, better, strips of wood pierced by nails upon which the fish are impaled.

The essentials of the smokehouse understood, various modifications may be introduced. If the ventilation is kept essentially as described, other materials may be used in the construction—wood, brick or cement.

Cleaning and Salting the Fsh

In preparation for smoking, the fish is first split along the belly from head to vent and the entrails removed. With some species, such as the bowfin, a short longitudinal cut just behind the vent is made, disclosing a dark mass (the kidney), which should be removed. The head is then severed and the fish thoroughly washed. The scales should be left on. Those fishes having a dark abdominal lining should be scrubbed with a stiff brush until the lining is removed.

If the fish are small, no further treatment is necessary before placing them in the brine. If they are large, weighing two pounds or more, they should be split down the back from the inside, severing the ribs close to the backbone, the cut being sufficiently deep so that the fish will lie flat. Extra large fish may be cut into two or more lengths and the large body pieces split as just described. This method of preparing the large fish permits the salt to penetrate more easily and insure a more evenly smoked product.

A brine is prepared by dissolving one pound of common barrel salt to each gallon of water. The fish are placed in the brine skin side down, and, as a general rule, should be left in the brine over night. On removal from the brine they are given a washing in fresh water for at least half an hour, and then placed on sloping trays or hung up to drain.

Smoking

Hang small fish to the iron cross rod by means of S hooks passing through the tail. Large fish, or those too tender to hold their own weight, may be hung by three hooks or by tying them with cord, or they may be cut into sections small enough to hang separately. Do not allow the fish to touch one another.

The fish are next to be dried. It is important that all surface moisture be removed from them, and it is well not to undertake to smoke fish on damp days unless necessary. If the weather is dry and clear, the fish may be hung in the sun and wind. In damp weather they are put in the smokehouse and dried by the fire, with the draft port and the top open. Build a fire on the floor of any fuel, except resinous materials, that may be obtainable; leave door open until fire burns freely, then close door and leave port open to creat a draft. This part of the process continues until the fish are quite dry on the surface. Unless properly dried, many of the fish will fall off the hooks and become a loss.

When smoking proper begins, replenish the fire and close the door, draft port and top. As soon as the fish begin to color open the draft port but at no time allow the fire to blaze. Smoking must be continued until the fish are properly cooked and have a dark brown color.

An advantage of the port opening is that through it the fire can be watched and replenished without opening the door. A good way to tell when the fire needs replenishing is

3 to 9 Bushels More Per Acre

California 3 to 6 bushels more per acre
Illinois 5 bushels more per acre
Kansas 3½ bushels more per acre
Iowa over 9 bushels more per acre

These are actual increases in yield per acre obtained on big farms in those states for several years by drilling instead of broadcasting. You gain both in yield and in seed saved by using a

John Deere-Van Brunt Grain Drill

Plants all the Ground—No Costly Bare Spots

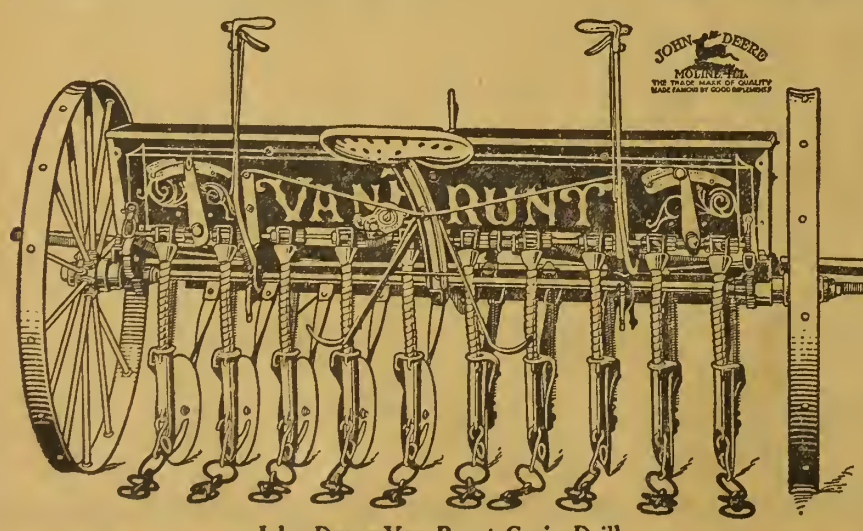
Coarse, medium size or very small seed can be planted with this drill. The force feed used on Van Brunt drills has a patented gate, adjustable to handle any size seed from alfalfa to large bearded oats, peas and beans.

All the ground is seeded—no choking up in the seed box. Change in quantity of seed by the feed shifter lever is exactly the same in each and every feed. The force-feed compels the seed to leave the seed box in even, continuous streams, but the seed is not crushed.

No clogging up—the Van Brunt successfully plants seed in mud, gumbo or trash. The seed is protected from the time it leaves the seed box until it reaches the bottom of furrow.

Disc bearings guaranteed to last the lifetime of the drill. The furrow openers, the hard-working part of any drill, are made of highest quality of steel.

Grass seed attachment can be furnished. It sows broadcast or in drills, as you desire. Van Brunt Drills are furnished in sizes and with equipment that will meet your requirements.



John Deere-Van Brunt Grain Drill

To get these books, just state the implements in which you are interested and ask for package ***BP23.***

JOHN DEERE, Moline, Ill.

to watch the escape of smoke. When it decreases, it is time to put on more fuel. If the door of the house is opened while there is a large amount of fuel on the fire the latter may blaze up and scorch the fish. It might be well to have a small amount of sawdust at hand for this emergency; scattering a small amount over the fire will check the flame.

Fuels Used in Smoking

Any dry wood, except fat pine, may be used in smoking fish. Driftwood is excellent. The sawdust and shavings from furniture and wagon factories are good, as it is easy to regulate the smoke from them. Green wood or damp fuel of any kind is objectionable because the moisture driven out with the smoke makes the fish soggy. Corncobs are quite satisfactory fuel. Pine wood imparts a resinous flavor to the product, making it very unpalatable. A small amount of pine wood may be used with other woods when better fuels are not available in sufficient quantity.

Protection from Mold

Smoked fish are best kept in a fairly cool and dry place, to prevent molding. They should, of course, be protected from ordinary household pests. Dipping in melted paraffin is a good means of providing a protective envelope about the fish. If this practice is followed, the fish should be handled as little as possible after dipping and allowing to cool, as the paraffin may crack and chip off. When the fish is to be prepared for the table the paraffin is easily removed by immersing the fish for a few moments in hot water.

Modification of Plan for Special Purposes

Certain modifications of the small smokehouse plan to meet particular conditions are suggested in the following paragraphs:

In cold or rainy weather condensation of moisture on the underside of the roof may occur, so that the dripping of water on the fish may injure the appearance, though not the quality, of the product. This difficulty has been overcome in practice by stretching a double thickness of burlap just beneath the top. This has the double effect of reducing condensation and of absorbing the moisture as it is condensed.

In very warm weather, or in the far South, the fire on the floor often causes too high a temperature within the house to admit of satisfactory results from methods of "cold smoking." For this method, since a temperature higher than 110 degrees Fahrenheit is not permissible, it is preferable to have a fire box removed from the house, and the smoke conveyed through an underground pipe ending in an elbow joint in the bottom of the smokehouse. A common stovepipe damper is placed in the middle joint of pipe, the ordinary handle being fitted with an extension by means of which the damper is operated from above when the pipe is covered with earth. This damper is the principal fire and smoke control.

A nice feature is added by the use of a "smoke spreader," which is a rectangular galvanized iron box, one foot square and two feet high, open at the bottom. Numerous three-quarter inch holes punched in the sides and top permit the escape of smoke. This box is placed directly over the mouth of the elbow and causes an even distribution of smoke throughout the house. It serves also to prevent the scorching of fish by direct draft, if at certain stages considerable heat is applied.

AMERICAN EGYPTIAN COTTON RECOGNIZED

Standards for American Egyptian cotton, 4000 bales of which probably will be grown in California and Arizona this year, soon are to be promulgated by the United States department of agriculture, according to a statement issued by that department.

The range of grade qualities of this cotton will be covered by five grade standards, ready for sale before the marketing season of 1918-19 opens.

The statement in full, as issued by the department, is as follows:

"For some years past a special type of Egyptian cotton has been produced commercially in certain of the irrigated sections of Arizona and southeastern California. This type of cotton was formerly known commercially as Arizona Egyptian cotton, but will now be designated as American Egyptian cotton, because it is being grown in states other than Arizona. The present indications are that commercial crop of this type of cotton for the season of 1918-19 may aggregate 40,000 bales or more.

Five Grade Standards

"The department of agriculture has been cooperating with the growers in developing this new industry. One of the features of this cooperative work has been the standardization of the commercial product. Investigations made, in connection with the standardization work, have shown that it is practicable to cover the range of grade qualities of this cotton at five grade standards. These grade standards will be as follows: No. 1, or fancy; No. 2, or extra; No. 3, or choice; No. 4, or standard; No. 5, or medium.

"Preparations are now being made to promulgate officially these five grades of American Egyptian cotton and also standards for staple lengths. The standards for length will show three staple lengths which will be known as 1½, 1⅝ and 1¾. Only the first two will be available for distribution at this time.

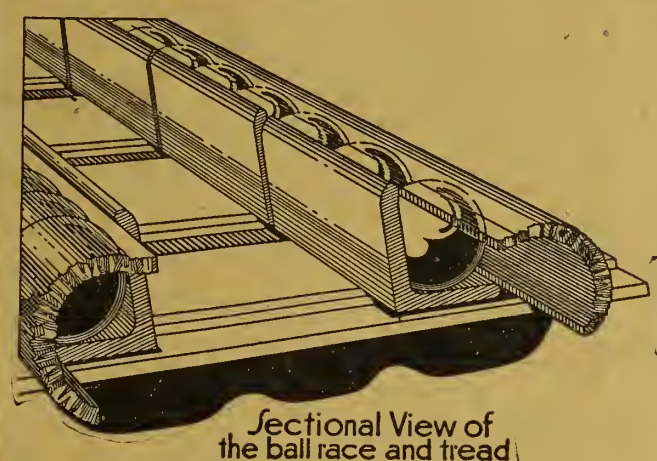
Samples for Sale

"These standards will be expressed in cotton of the variety known as Pima, which is the variety being planted almost exclusively the season of 1918. Suitable material has been collected and purchased for making up these standards of grade and length and copies of the standards will be ready for sale before the marketing season of 1918-19 opens. The price of the copies will be $5.00 for each grade box and $25 for the full set of five grades, and samples of the lengths standards will be offered for sale at $1.00 each. Any parties contemplating the purchase of a set of copies of these standards can secure the desired information by addressing Charles J. Brand, Chief Bureau of Markets, Department of Agriculture, Washington, D. C."

Low Grade Imports Taboo

The war trade board has replaced Egyptian cotton on the restricted imports list. After today importation of brown Egyptian and other low grade cottons from Egypt will be prohibited.

The importation of 80,000 bales of high grade Egyptian cotton will be permitted during the present calendar year.



Sectional View of the ball race and tread

Yuba Ball Tread Tractor

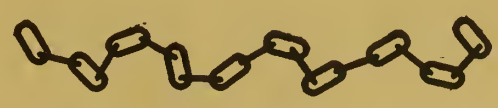
The steel balls are true to a small fraction of an inch, round as a billiard ball.

Whether the tractor runs on a level field or side hill, the thrust is the same. Whether the weight comes from the top or either side, the balls roll the same because they are perfectly round.

There is little friction—and there's no drag—the heavy machine glides on the hard steel balls.

Much force is required to drag a heavily loaded sled, but the same load on wheels is pulled by less power. Wheels **roll.**

You've seen a long freight train standing still, cars close-up. When starting it is necessary to pull the first car ahead, then the second and thus haul the whole lot, until the slack is taken up, before the last car moves.



It's the same with the loose chain, power is necessary to haul the slack.

With the taut chain the power required is less—thus giving most of the power to the draw-bar—where it is wanted.

With the taut chain tread and the steel balls on which to glide, friction is reduced to a minimum.

There's economy of power in the Yuba **Ball Tread Tractor.**

ture of the United States department of agriculture.

The matter was referred to Dr. L. O. Howard of the division of entomology. It just happened that Walter T. Swingle, agricultural explorer of the division of seed and plant introduction of the United States department of agriculture was studying in Italy on his own account at the time. It was through his great interest in the subject and the painstaking methods that he pursued in sending Mamme figs over in the month of March in the years 1898 and 1899, that in the latter year the insect finally decided, after so many years of constant and persistent work on my part, to become domiciled in the new world, and small as it was, to make history for the fig, as well as to place California commercially as a competitor of Asia Minor in the production of the far-famed "Genuine Smyrna Fig." In the year 1901 I made a trip to Europe and Asia Minor to personally investigate fruit conditions, and more particularly to see for myself how caprification, cultural and packing methods are larried on in Smyrna. I spent two months in Asia Minor in carrying on my investigations. I was appointed a commissloner of the United States department of agriculture, and my work was very materially facilitated thereby.

I have only one more historical event to recite and then the remainder of my paper will dwell on facts directly concerning the grower.

Strange to relate, but in the year 1908, Mr. Rixford made a wonderful discovery, and he was ably supported in the theories that he advanced by Dr. Walter T. Swingle, for in an address made before the State Fruit Growers' Convention in 1910 at Stockton, these gentlemen were very positive in their declaration that this much sought after wasp, the Blastophaga Grossorum, which had caused me so many sleepless nights, so many thousands of dollars, and such a tremendous effort, had been quietly reposing, undisturbed, in the Gates tree, about five miles southwest of Ripon. The tree was planted in 1867. From 1868 to 1908 according to the statements made in the address, this tree was colonized with the blastophaga.

Shortly after this paper was read, I replied to it, fully explaining why I did not think the views expressed by the gentlemen already referred to were tangible. No reply was ever made to this article, although both Messrs. Swingle and Rixford have, from time to time reiterated their views, claiming the insect was in the Gates tree from the time they claim it had been there, but offering nothing new to substantiate their contention. I still insist, as I did then, the wasp became colonized in this tree through colonies which I personally placed in the capri fig trees in the neighborhood of Ripon and Modesto. The following is an excerpt from the article which I wrote for the California Cultivator, and which appeared in December 29, 1910, in that publication.

"Another strange feature in connection with the Gates tree is that Mr. Watkins and others at Ripon, who have trees which are not much over five miles from the Gates tree, showed no signs of infestation until colonies of wasps were actually placed in these trees.

"How different has been my own experience. The year following the introduction of the insect on my place it found its way into Roeding's Capri No. 3, growing on the vineyard of F. M. Roessler, five miles northwest of my place. I was not aware the tree was growing there, and my attention was first drawn to it by samples of figs brought to my office in the month of March 1900.

"Is it not a striking coincidence that the Gates tree should also have escaped having the parasite 'Philotrypesis' introduced into its figs?

"The version of the early settlers on the Gates Ranch reminds me very forcibly of an experience of mine while visiting the fig bazaar in Aidin, Asia Minor, in 1901. I opened a capri fig which was full of blastophaga as well as its enemy, the Philotrypesis. I showed the fig to an old Turk who had been engaged in the growing of figs all his life. He informed me with much gusto that the parasite was a most wonderful and valuable worm, in fact, the best of all.

"Poor blastophaga, you for whom I worked and strived; is it possible that the ridicule I endured, the care of a 60 acre fig orchard for a period of 14 years without any returns, the sending of a special agent to Arizona; the effort to secure one of your tribe from Mexico, through the recognized entomological explorer, Mr. Koeble; the plowing and harrowing I gave the United Etates department of agriculture to awaken an interest in this subject; the investigations by Dr. L. O. Howard and his able assistant, A. E. Schwartz, in fully elucidating the most complicated entomological and botanical problem of the day; was all for naught? Is it possible as a poor despised worm, ant and fly you have resided in Stanislaus County these many years? Oh! that I could believe it."

I am pleased to say that at last, after 30 odd years of effort, there is a genuine interest being manifested in Smyrna fig culture. The attendance at this meeting and the remarkable demand for Smyrna fig trees are conclusive evidence that Smyrna fig culture has at last come into its own.

Fundamentally, the difference between the Smyrna type of fig, as compared with those which have been grown in California for so many years, is that the Adriatic varieties mature their fruit. Although their flowers are imperfect and the seeds are hollow, the fruit nevertheless is good to eat, without the agency of the fig wasp. In the Smyrna figs unless the female flowers are pollinated they drop off without ever reaching maturity. The White Adriatic, Mission or California Black, Brown Turkey, White Endich (or Kadota) and kindred sorts, occasionally have perfect female flowers, but a good part of them are imperfect or commonly termed "mule" flowers.

The capri fig and the Smyrna stand in the relation of male and female to one another. It must be understood, although the capri fig stands in the relation of male to the edible fig, that in its several crops during the season it has male, female, mule and gall flowers. To properly understand caprification and the manner in which the pollen is carried to the female, or edible, fig, it is necessary to explain the construction of the capri fig. This fruit, known as a fig, though worthless as a food, is really a hollow inflorescence, the greater part of its wall being lined with gall flowers which are mature when the eye of the fig is opened sufficiently to permit the entrance of the wasp, while the male flowers, occupying a limited zone near the eye of the fig, mature later when the fruit is ripe. From a practical standpoint the capri fig ripens three crops annually: the first appears in March, the second in June, and the third in September. The first is known as profichi, the second as mammoni, and the third as mamme. The propagation of a fig wasp takes place in the following manner: The insect remains in the larval state in the overwintering, or mamme, figs. In the spring when the new growth starts on the capri fig the profichi figs start to grow on the new wood. Just at this time the insect has passed through its several evolutions and the female enters the young profichi figs through the eye which is apparently tightly closed at the time, although it is open sufficiently to permit her entering, and deposits her eggs in the ovaries of the gall flowers. In consequence of this puncture made by the female wasp, the female flowers enlarge after the manner of galls, and in place of its own embryo, the wasp embryo develops. In the early part of June, and continuing into july in this district, the profichi crop commences to ripen its fruits. The wingless males are the first to appear from the galls. They gnaw a hole in the gall containing the female winged wasp and impregnate her. She gnaws her way out of the gall by enlarging the opening and then crawls out of the fig, getting her body and wings covered with the pollen from the male flowers which are then mature. It is at this time that these figs are gathered and placed in either wire or strawberry baskets in the Smyrna or Calimyrna fig trees. The fruit is then the size of a marble, the female forces her way through the eye of the fig, very often losing her wing in the operation, so determined is she to gain entrance into the fruit. In this case a deception has been practiced on her, for the construction of the female flowers in the edible fig prevents her depositing her eggs, but in her strenuous efforts to prepetuate her species she dusts the female flowers with the pollen which has adhered to her body in her passage out of the capri fig, and she either perishes within the fig, being absorbed by the juices of the fruit or she crawls out and dies. As a result of her efforts a most delicious fruit is produced and is scientifically perfect, for each seed contains a germ.

Experience has demonstrated the necessity for having several varieties of capri fig trees in succession in the month of June when caprifying the Smyrna fig. Time will not permit going into details concerning varieties. As a matter of fact, the fig business, like any other branch of fruit growing carried on in a commercial way in California, will finally sift itself down to a few varieties which will become standards through the high excellence of the figs produced for the several purposes for which they may be used, viz.: fresh, canning, preserving, drying, crystallizing, etc. It is very fortunate for the future of the industry that from its inception the list has been reduced to a minimum, for should there be any expansion in the matter of varieties, the list will be increased, it is reasonable to expect, along sane lines, and new varieties will only be given consideration providing they possess well defined merits. The same line of reasoning should be applied to the capri figs, and any effort on the part of nurserymen to induce growers to devote their attention to this or that variety, because it may have a slightly different color or shape, means absolutely nothing to the man who is engaged in the industry for the purpose of earning his livelihood. At this time what is actually required to bring better returns is a variety earlier than Roeding's No. 3; larger profichi figs for the purpose of having more insects in a single fig and a variety in which the mamme figs will be even more resistant to cold than those we are now growing. My experience has been that Nos. 1, 2 and 3 answer for all practical purposes, although there are other varieties, such as Milco, on account of its late ripening; Magnissalls, the largest of all capri figs, and ripening about the middle of June; and Dr. Meyer, (E), the latest of all in my collection of 20 or more varieties, will all have their places in the list of varieties serving a practical purpose.

Among the named varieties of edible figs originally received from Smyrna I had the following: Bardajic, deriving its name from its close resemblance to the form of a water jug, and growing almost exclusively in the vicinity of the city of Smyrna, a most delicious table fig, but very subject to splitting, and, even with this serious fault eliminated, valueless for drying due to the tough skin; Cheker Injir, signifying "Sugar fig," and growing on the Island Chios; Kassaba, a most distinct type with its very broad, slightly lobed leaves and producing fruit very similar in shape to the Calimyrna, but with carnationred pulp. The fruit matures ten days earlier than the Calimyrna and makes equally as good a dried fig.

There were several unnamed varieties, none of which possessed any particular merit, among them being the Purple Smyrna, growing very dense and assuming almost the umbrella shape of the Texas Umbrella, and the Maple-leaved, which was so designated on account of its maple-like foliage.

In the Bulletin importations there were a number of mixtures, and I have often thought that the natives in taking cuttings had been particular to cut them from a seedling orchard, several of which I saw while in Asia Minor in 1901. Again, I wish to reiterate that it is not so much a matter of varieties which has any bearing on the industry as much as the developing of a fig which will be sweeter than the Calimyrna, have a thinner skin, and, above all other considerations, one that will not split.

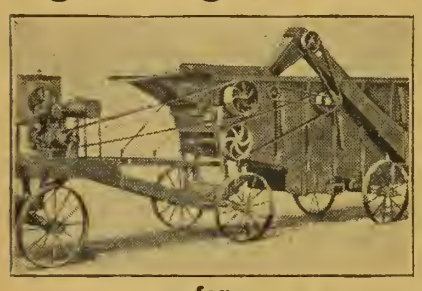
In planting an orchard the capri figs should be set in a block by themselves. Figure on having one capri fig to 20 Calimyrnas. On small holdings capri fig trees should be used as shade trees around the buildings, for they make excellent shade, with the further advantage that the buildings afford protection to the trees in the winter months, thus preventing injury to this crop from severe cold weather.

In conclusion, allow me to say that, in all fairness to myself, I consider it the duty of Messrs. Swingle and Rixford to present more conclusive evidence than they have succeeded in producing thus far in connection with the establishment of the fig wasp in the Gates tree.

I wish to add further that it is a great source of satisfaction to me to have growers claim so many superior virtues for this little wasp now, which for so many years occupied the position of an interloper in the fig industry.

Cushman

Light Weight Motors



for
Bean Threshers
Combined Harvesters
Potato Diggers
Rice Binders

Corn and Grain Binders, Shellers. Ensilage Cutters and all other farm work.

4 to 20 H. P. Weigh only about one-fourth as much as ordinary engines, yet run even more steadily and quietly.

Moving parts run in oil, absolutely enclosed; free from dust.

Equipped with Throttling Governor, Carburetor and Friction Clutch Pulley. Cooled by circulating water system, driven by engine pump.

Thousands are in use in this state, doing more different kinds of work than any other type of engine. Sold by California Representatives and distributed from stock in California Warehouses. Write for Book on Light Weight Engines.

APPLETON Silo Filler

New models save you every way.

Here's the best value in a silo filler ever offered you. We say this from 47 years farm machinery manufacturing. We *know* that the new Appleton, with its *important new features*, will prove the biggest labor-saving, time-saving and money-saving machine you ever bought.

Built on the same quality basis as all the Appletons—the same tremendously strong, everlasting frame and trouble-proof construction; big capacity and light running qualities that make the Appleton always *outdo* and *outlast* other silo fillers. Sizes for 6 h.p. and up. Don't wait until you are ready to order. Write today for

Difficulties Confronting the Dairy Industry

IN AN ADDRESS delivered at the National Milk and Dairy Farm Exposition in New York Food Administrator Hoover referred to the complexity of the dairy situation. He said that these complexities arise from the fact that in a considerable part of the industry the raw material in feeds, the labor, land and equipment employed, are by-products of other major agricultural operations, and the commodities produced are all in different circumstances by-products to each other. This complexity is again confounded by the fact that the by-product is different in different localities and at different seasons of the year; for instance, butter and cheese may be a by-product to city milk production—they are the major product in creamery regions.

It is an industry to certain products of which attaches a peculiarly large amount of sentimental value. Fluid milk is the absolute foodstuff of our babies and is equally a necessity to very poor as to the rich. The consequence is that a rise in the price of milk may provoke more blind and fanatic opposition than any other of the food industries, not even excepting bread. Again, fluid milk is the most perishable of all the food commodities and the easiest subjected to infection and adulteration. It is an industry thus susceptible to an extraordinary degree to the varying economic winds. The varying production of roughage, the varying prices of concentrates, the lack of balance in prices of milk, butter and cheese, all make the dairyman's life an exciting, if not a merry, one.

Prior to the European war our dairy industry was practically a matter of domestic interest only. Since the war there have been increasing demands for contribution to the world's shortage of foods. This is, however, not the only pressure of war on this industry because an industry of so complex an economic character is peculiarly subject to the shocks of commercial dislocation that have penetrated into all quarters of our national life. It is these war dislocations that gave birth to the food administration, and it is with these problems that the government is called upon to deal. I should like to emphasize this point. The food administration is not a busybody, searching for opportunities to interfere in industry and trade. Its sole preoccupation is, so far as is physically possible, to soften the shocks of war that the food supplies of our own people and the Allies may be maintained. I can perhaps illustrate this by a review of only one or two war dislocations which have affected the industry and the steps taken by the food administration to ameliorate them.

At the time of the establishment of the food administration last summer we were confronted with a price level in feeding stuffs for animals that had not been witnessed in the United States since the Civil War. Heavy exports to Europe of all character of foodstuffs during the previous 12 months had drained the country of its surplus production of food supplies but had also even exhausted our normal carryover from one harvest to another. The consequence was that we entered upon the harvest of 1917 with less supply of all kinds of feeding stuffs than at any similar period in 15 years. In fact had the harvest been a total failure the human beings and the animals in this country would scarcely have survived for 60 days a situation not only pregnant with speculation and high prices, but positive national danger through lack of supplies to equalize short production in any direction.

The dairyman was caught between two forces, a low price in milk, held down by inherent opposition of the consumers, and high price in feeding stuffs and labor. No doubt in the long run if matters had been allowed to take their course, the dairy cattle would have decreased to a point where a shortage in milk supplies would have compelled the necessary increase in milk prices. Some day these milk prices would have risen to a point that would have again re-stimulated the industry and in the course of years the number of dairy cattle would have been restored and an equilibrium again established. These are not times however, when we can run the risk of sapping the root of our production and await years for its regrowth. We had all hoped for a considerable time that the unusually large promise of feeding stuffs last harvest would result in decreased prices in feeds and that the dairymen's position could have been saved without material increase in the price of milk to the consumer. We worried along until November when there developed so great a car shortage by the war demands upon the railways that it became evident that the crop would not move with sufficient rapidity to remedy feed prices before spring. We therefore determined that some action would be necessary in protection of the producer. To make matters worse, you will recollect we came into an unparalleled period of storm weather extending from the first of December until the middle of February that further paralyzed our railways and created a situation of practical famine prices of feed stuffs in those parts dependent on railway movement. By the middle of February the railways had moved 150,000,000 bushels of corn less than normal and correspondingly less quantities of all other feeding stuffs. There were immense stocks in the hands of our feeding stuffs producers but it could not. through railway strangulation, reach the consumer. We had therefore to suffer from continuously ascending prices until the railways were able to offer a freer movement. Within a month after that wider movement began to take place this spring the price levels of feeding stuffs began to fall more nearly to ratios comparable with the supplies and the outlook from now on is for more reasonable prices.

Here is therefore one issue upon which the dairy industry has been directly disrupted by the war and if we were not to witness a large selling of dairy cattle for meat, some increase in the price of milk was vital or the city milk industry would be imperilled. Proposals to increase these prices brought about con icts between producers, distributors and consumers, not only of the most acrimonious character but in which the law was invoked in various directions and practical deadlock resulted.

Furthermore, I had also long held the view that various associations amongst producers were the foundations upon which a better marketing system must arise in the United States in the interest of both producer and consumer, and that, growing out of the bitter quarrels in various parts of the country, the existence of producers' associations were being endangered. I also realized that any increase in price meant fearful hardship and suffering upon some sections of the community and furthermore that any interference with the ordinary course of trade meant a series of incidental reactions all of which would be disagreeable enough but yet none of which would be so disastrous to the community as no action at all.

In other words, like all cases of interference in the normal course of supply and demand, it became the choice of evils. The issues at stake were not only from the point of view of the feeding of our own populations but the broader issues of our reserves to meet the demands of the Allies.

The first and most immediate reaction was that with an increase in price there was a great fall in consumption and therefore a damming back of the surplus on the hands of the producer and distributer. In other words, the poorer sections of the community spent the same sum on milk and took a less quantity. There was thus the heartbreaking reaction of diminished milk feeding of our own children. That has been more or less overcome by propaganda in these sections as to the necessity for milk for children. This has led to a larger consumption. I am informed that it is now again about normal and we wish to continue the insistence as to its superior value to all foods for the little ones.

Buy Your Next Herd Sire at

Hollywood

We offer two exceptional values at the present time in young bulls.

No. 1—Born February 15, 1918

Sire—KING KORNDYKE SADIE VALE, the only 40 pound bull that has a 40 pound daughter.

Dam—S. V. H. ALTOANA ORMSBY, a daughter of Sir Veeman Hengerveld. She made 16.70 pounds butter in seven days as a three year old right after being unloaded from the cars from the east and is capable of a much larger record.
This young fellow is a splendid individual, three-quarters white, and is a splendid buy at the PRICE $500.00.

No. 2—Born May 9, 1918

Sire—HOLLYWOOD PIETERTJE KORNDYKE, who is by Hollywood Lilith Palmyra, 11 A. R. O. daughters including a 33.44 pound three year old, and out of Pietertje Korndyke Abbekerk, 712.9 pounds milk and 35.30 pounds butter in seven days, 3235.8 pounds milk and 141.6 pounds butter in 30 days, 9300 pounds milk and 375.0 pounds butter in 90 days. As a senior four year old she made 23,874.2 pounds milk and 984.83 pounds butter in one year, and she is a granddaughter of Pontiac Korndyke.

Dam—PIETERTJE HENGERVELD CREAMELLE, 621.5 pounds milk and 30.24 pounds butter in seven days, 2648.7 pounds milk and 124.18 pounds butter in 30 days, 16,633.8 pounds milk and 691.56 pounds butter in 305 days.
The dam and sire's dam of this calf average:

Milk seven days	667.10
Butter seven days	32.77
Milk 30 days	2,942.20
Butter 30 days	132.89
Milk one year	20,254.00
Butter	838.19

(Average of yearly records includes the 305-day record of his dam and the four year old record of his sire's dam.)

This choice young fellow is about two-thirds black, and his breeding on both sides is unexcelled. We recommend this buy as a sure money maker. He will not be here long at the price, $500.

Percherons in Canada

By Wayne Dinsmore

During the last 19 months the Percheron breeders of the United States have sold more than 1000 Percherons to Canadian buyers. Six hundred and eleven of these were purchased during the last seven months by 91 different Canadian buyers. Thirty-two purchasers were located in Alberta; four in British Columbia; 12 in Manitoba; one in New Brunswick; seven in Ontario, and 35 in Saskatchewan. Two hundred thirty-nine out of the 611 sold this past season were mares. It is believed that this constitutes a record for the exportation of any kind of pure-bred live stock to Canada. These very heavy exportations are significant of the growing popularity of Percherons in all parts of the Dominion, and of Canadians' firm belief in the prosperity in store for breeders of good draft horses.

The Percherons in America are reared by average farmers who use the mares in regular farm work. Most of the colts recorded have been registered by men who raise only one or two colts per year, as is clearly shown by the fact that the 10,508 registrations made during the last fiscal year were made by 5198 separate breeders. The distribution of breeders by states is approximately the same as distribution by registrations given in paragraph above.

Hogs Need Shade and Clean Water

Shade and clean water during the summer months are essentials to successful pork production. All kinds of hogs must have shade. Too much direct sunlight and heat is a frequent cause of hogs failing to thrive and is often the cause of hogs dying. During July and August small pigs often blister on the backs and about the ears which causes, in some cases, severe infections and bad sores.

Expensive shelter is not necessary. Shade trees provide ample protection. Where no trees exist temporary shade may be provided by the covering of a frame with canvas, under which the hogs may go for protection. Some producers build individual hog houses with sides that may be lifted to provide an increased amount of shade during the summer months. This plan furnishes shade for hogs where only a few are kept.

Clean fresh water for drinking and wallow is equally as important as, or more important than, shade. The old time wallow hole covered with scum, which was once also the drinking fountain, is no longer in favor with the successful hog feeder. Hogs must have water to drink, and if they cannot get fresh clean water in the trough or fountain they will drink where they can find it, regardless of its condition. This fact has caused some to believe that hogs prefer nothing better, but they do and will demonstrate the fact when they are able to get fresh water from the well.

The clean wallow hole is also important. Hogs may use the muddy wallow if no other is available; but, again if clean water is provided in a concrete wallow they will prefer it to the mud hole. Concrete wallows are not expensive, according to S. T. Simpson of the University of Missouri College of Agriculture, if constructed at odd times, when regular farm labor can be utilized. An excavation six by eight feet, or larger, and about 14 inches deep, walled and floored with concrete and filled with water will prove profitable attraction to the hogs on hot summer days.

New State Jersey Record

The Register of Merit certificate for the Jersey cow Interested Jap's Santa, 296928, owned by the University of California, has just been received from the American Jersey Cattle Club, showing that she produced during the lactation period ending January 3, 1918, 13,308.5 pounds milk and 805.72 pounds butter fat, average per cent 6.05, at four years, two months at beginning of test.

The record was made under a great handicap. About the middle of the lactation period, during the months of August and September, the cow suffered from a throat trouble which for some time threatened to prove fatal. For nearly three weeks she did not eat and dropped from 35 to 12 pounds of milk per day during this period. However, she gradually recovered and her flow of milk increased again to about 20 pounds of milk a day during October to December. But for this setback, her production for the year would very likely have exceeded 850 pounds of butterfat.

This is the third Register of Merit record Santa has made. During her first lactation period she produced 5838.9 pounds of milk and 353.71 pounds of butterfat at one year, nine

Three Daughters of Gertie's Lad

months at beginning of the record period. During the second lactation period she produced 9052.5 pounds of milk and 588.16 pounds of butterfat at two years, 11 months old. The three Register of Merit records, therefore, exceeded the requirements of the American Jersey Cattle Club by 41, 107 and 140 per cent, respectively, for the first, second and third lactation periods. If she continues to improve on the requirements she will make her way near the top of the record of Jersey cows in the country. Her last record places her first among California Jerseys and fifth in her class for Jerseys in the United States, the present leader in class six being Sophia's Adora, 2995994, with a record of 888.0 pounds butterfat.

Control Sheep Pests

The gad fly, or grub-in-the-head, the sheep mange mite, and the sheep "tick" are the three most important insect pests of sheep. The gad fly is related to the bot and warble flies, and lays its eggs, or young maggots, in the nostrils of the sheep. The maggots work into the nasal passage, where, in severe cases, they cause a weakening of the sheep, and later death. The pest may become more abundant from year to year where the same pastures are used and where no attempt is made to check it.

The sheep fear the fly. Provide shade in the pasture and scatter straw around, or keep the sheep's noses smeared with tar or other repellent. The fly attacks the sheep only in bright sunshine, and when the animal runs for shade or sticks its nose into the straw or bushes it escapes the pest. Sheep will keep tar on their noses to some extent if the repellent is smeared around auger holes in a board or log which contain salt.

In case of a large flock, dipping is the most practical means of controlling scab and ticks, according to Leonard Haseman of the University of Missouri Colleg of Agriculture. Where only a few sheep are to be treated, stock dip, or oil used sparingly, will keep the animals free.

Concrete Floors Conserve Feed

With the scarcity of feed, rising prices, and the great necessity for maximum production, no feeder can afford to do without a good feeding floor. There is a great waste of feed when the cattle and hog feeding lots are poorly drained and are a mass of mud. The advantages of a paved lot and feeding floor are: The stock make greater gains, feed is saved, feeding is made easier, manure is saved, sanitation is improved, thereby reducing disease, and clean animals usually bring better prices.

The cost of the average feeding floor, even at the present prices, should not be more than ten cents a square foot. On many farms it can be built for less cost, because often all material except cement is at hand. Any concrete worker who can build a satisfactory sidewalk should be able to construct a feeding floor. At the present price of meat, the sale of one hog will pay for feeding floor space for from 30 to 50 head. Investigation shows that the floor will often pay for itself in one feeding season.

Farm Labor

Up to the present moment all crops are being harvested with but little loss as far as we can learn, excepting some large acreages of asparagus for lack of labor.

Many thousands of acres of crops were not planted because no labor was in sight to make and harvest the same, which otherwise might have contributed to help win the war.

The women have responded well for the orchard and fruit work. They are proving effective and show a fine spirit.

The grain harvest is progressing well. We do not know of any machines standing idle for lack of men to run them. However, the very light crop in many sections of the state, many fields not being cut at all, must not be lost sight of.

Rice fields are now beginning to need attention as to cutting out water grass and this is something that has had to be done hertofore by Japanese and Hindoos. Most of these laborers are farming for themselves this year, many of them preferring to ride around in autos which they earned last year by inordinate wages and by big crops where they had leased land, rather than to be doing rice work.

If any fruit farmer is in need of labor the Woman's Land Army stands ready to furnish it. If all farmers would call on the free public employment bureaus when in need of laborers they would find the state and the United States government service both ready to aid them.—J. P. Dargitz.

Stanislaus Princess Cleopatra

A cow on Rosamaines Ranch owned by Stalder Brothers. She has seven day record at two years 11 months of 406.3 pounds milk, 17.022 butter; at three years 11 months, 28 days, 513.9 milk, 31.41 butter. Thirty day record at same age, 2299.7 milk; 119.446 butter; at four years, 11 months, 14 days, 2050.10 milk, 128.171 butter.

TREES

For Sale to Nurserymen or Large Planters—Owner of a large block of very fine Eureka Lemon trees will sacrifice at a ridiculously low price to those who will take a large quantity. These are not old dirty culled over stock, but strictly first class trees, clean, thrifty and straight, budded high on sour stock, never have been frosted or stunted in any way. Ground has to be vacated by July 1, so this stock will actually be sold at LESS THAN SEEDLINGS CAN BE RAISED. Address X, California Cultivator.

For Sale—Very fine Valencia trees, two year high buds; ¾ inch to 1⅛ SOUR ROOT. Also yearlings, SWEET ROOT, ½-in. to ¾-in. all very thrifty, finest soil for balling. S. R. Coate, 564 So. Los Angeles St., Anaheim, California. Pacific 403 J.

Valencia Oranges and Eureka Lemon trees one year past, ¾ to 1 inch. Pedigreed stock on sour root, high buds. We will bud 6000 choice seedlings to your order. Seed bed stock for sale. Randall Bros. Nurseries, Whittier, Cal.

For Sale—Seed Bed Stock, Orange and Lemon Trees, and Avocado Trees of all standard varieties. Walker-Hubbard Nursery Co., San Fernando, California.

Citrus Trees — All kinds, any quantity. Butler's Morning Side Nursery, Lamanda Park, California.

Citrus Nurseries, Murphy Oil Company East Whittier, California. Selected stock for sale; inspection invited.

FARM LANDS FOR SALE

400 acre stock and grain ranch 3 miles Pleasant Valley R. R. station, Mariposa County, California; 100 acres cleared and tillable, nearly all of the 400 acres could be farmed if cleared of the large oak and other trees, wood sells for $12 per cord at station, 3 and 6 room house, large barn, and out buildings, black smith shop and tools, ranch fenced and cross fenced, part hog tight, hogs never have cholera here, family orchard and garden irrigated from springs. Average rainfall 29.88 inches; grapes, olives, almonds, etc. grow without irrigation, feed in pastures and free outside range adjoining knee high, elevation 1500, no alkali or hard pan, ½ mile school and church, $30 per acre including 300 goats, 3 horses, 3 head cattle, turkeys and chickens and all farm implements. $3000 cash, balance long time 7 per cent. Fred B. Palmer, owner, Coulterville, California.

Attention Land Buyers!
Here's an excellent proposition: 40 acre farms selling for $15 to $25 per acre, long time payments, 6 per cent interest, in the best agricultural part of Snohomish County, where you have all the modern conveniences, paved roads, railways, schools, churches, mills and factories. This district has proven its worth by the many successful farmers now located there. We also have some beautiful water front 10 acre tracts. OPPORTUNITY knocks at every man's door ONCE, but believe me, it does not continue to knock forever nor does it pound the door down. For further information address the owners, BROWNELL LAND CO., 904 Third Ave., Seattle, Washington.

40 Acres Near Manteca—20 in nine year old almonds, 20 in ten year old vineyard interplanted with four year old almonds. Crop last year was $5,300. This year's crop estimated $7,000. Price before August 1st with crop, only $13,000, half cash, balance to suit. Walter Buchanan, Ripon, California.

For Sale—5¾ acres good land, grow anything; 12-inch artesian well, 50-inch water, 900 ft. cement pipe; 5-room house; small barn. Fine climate. Nice all year round. $4,000.00. Terms if taken at once. Owner Paul McKaughan, No. 31, Hueneme, California. Home 6923.

Retail Dairy with modern equipment. 30 select cows, fine 20 acre ranch, beautiful 11 room house, barns, silos, pumping plant and many other things to go with the ranch. ½ mile from high and grammar school. Los Angeles suburb. Address V, Care Cultivator.

20 acres deep silt land, joining good town on the South; 10 a alfalfa, 10 a grain; 300 feet to railroad station. Plenty of water for irrigating. Soft water piped on place. Price right. Chas. McNeely, Alpaugh, California.

Fine 40 acre complete dairy ranch near Los Angeles. Some money required but will sell on easy terms. Might exchange for income property. Value $40,000. Address W. J. Holden, R. F. D. 13, Box 144, Los Angeles.

For Sale—160 acres at $1,600.00; make fine fruit, nut, bean, hog, dairy or grain ranch; abundance of water; 80 acres level; adjoins reserve; main road; rural mail; bumper crops. Dr. C. W. Dewlaney, Santa Margarita, California.

Be Patriotic, Raise Stock on productive government land, plainly marked on county sectional maps. $2.50 ANY county. Booklet, particulars for stamps. Write Joseph Clark, Sacramento.

Manteca Small Farms bring big returns. See them and buy now before the fall rush. Irrigation and no failures. Walter Buchanan, Ripon, California.

For Sale — Country store, $600 monthly sales (at invoice) with olive ranch, 5 ton crop, buildings and implements, at $2,500.00. C. J. Bailey, Valley Center.

GOATS

For Sale—300 Angora goats not over three years old. Frank Motte, Box 107, Arlington, California.

Toggenburg Milch Goats — Rae P. Williams, Federal Realty Building, Oakland, California.

War is an ugly thing but a German peace is uglier—Russian farmers are producing German food.

The Case for Pure Breds

Written for California Cultivator By Jean A. Koethen

ALL breeding is based on the principle that like produces like. The breeder who starts with two birds, the best hen and the best cockerel he can find, has the foundation for a flock of splendid, line-bred birds, some of them better, perhaps, than the parents, and all approximating in type and size and color the original birds. This principle is the foundation of the splendid work that has been done by fanciers the last 20 years, and is responsible for the development of millions of heavy-laying White Leghorns in commercial flocks.

No one questions the fact that like produces like in the fancy, but there are still not a few amateurs, farmers and back-lot poultry keepers who argue. "I don't want anything fancy. Just plain chickens that will lay eggs for me. If I choose to mate a Barred Rock hen to a Rhode Island Red male, I shall get eggs, and that is all I want." Such reasoning is all right if the premises are all right, but are they? Is a mating of Rock to Red sure to produce eggs and to go on producing eggs generation after generation?

Up at the Oregon experiment station they were not quite satisfied with their Leghorn hens. There seemed to be a lack of vigor which was not conducive to the highest production. To remedy this, Professor Dryden mated Leghorn with Barred Rock, but there he stopped in his outcrossing. The offspring of this mating, that is, the best of them, were mated back to the original Leghorn stock for several successive years. The result is that the Oregons, as they are called, are a little larger than the ordinary Leghorn and more prolific, but in looks, and really in breed, they are White Leghorns. That single infusion of Barred Rock blood gave the size and vigor required without change in appearance or character. The same thing has been done in this state with Leghorns and Minorcas. Many California Leghorns have Minorca blood, but they are still Leghorns. Nearly every known breed today is the result of outcrossing. William Cook, the originator of the Orpingtons, crossed and recrossed before he got what he wanted, but he knew what he wanted, and he knew how to outcross without destroying the original blood lines.

Now what happens when a Rock is mated to a Red? Gregory Mendel, a German monk of the nineteenth century, spent many years studying the cross-fertilization of peas, and discovered this law: that when two individuals of types A and B are mated the offspring will resemble the parents in the proportion 25 A, 50 AB, 25 B. That is, in 100 fertilizations, 25 will follow the mother, 25 the father, and 50 will be mixed. If one could be sure in mating Rock and Red that the eggs he incubated would be those which followed either parent, crossing would not be such a gamble, but the fact that there will be twice as many hybrids as pure-breds makes it almost certain that the offspring of the outcross will be mainly hybrids. If these hybrids are mated back to either parent and no more outcrosses are made, the stain is soon removed and the breed continues pure Rock or Red, as the case may be, but when these hybrids of the first generation are mated to one another all the results of years of mating and breeding are destroyed and you have just mongrels, nothing more.

It is easy to see how color and type may be destroyed in this way, but the effect on egg production is not quite so obvious. The first outcross usually increases vigor and stimulates egg production to a certain extent. The hens of the second hybrid generation may lay about as well as the pure-bred parent stock. In the third generation, unless a pure-bred male is brought in to bring the stock back to some standard, there must be deterioration. The trouble is, so much less attention has been paid to breeding for eggs than has been given to breeding for size and color that there is no inherent tendency to break up. This is why we so frequently hear of some disreputable old hen of no breed or color that is outlaying all her pure-bred sisters. Mongrels are not as good layers as pure-breds that have been bred for eggs. When you trust to luck, as the average amateur does, the lightning may strike anywhere.

Eggs aside, the mongrel has no case at all beside the pure-bred bird, for no matter how you breed you never get anywhere. This year your hens lay. Next year they do not. Why? "How should I know?" growls the advocate of mongrelism. There is only one reason. Like produces like. Mate mongrels promiscuously and you are upsetting what little is left of the original blood lines. If there are any good layers, it is because you have accidentally mated correctly.

There is no more useful fad than the culture of poultry. Beautiful hens are a joy forever, and there is the greatest satisfaction in taking a good breed and improving it. You know that you are not only producing food but in building up a strain of vigorous, prolific birds you are contributing something to the sum total of human progress. It is in this way that the live stock industry has been built up. Why should the poultry industry lag behind?

Egg Laying Contest

Report for the thirty-fourth week ending June 26.

Storrs, Connecticut, June 27, 1918. In the thirty-fourth week of the laying contest at Storrs the total production of all pens amounted to 3994 eggs, or a yield of 57 per cent. First place for the week was won by a pen of White Leghorns from Hollywood, Washington, with a production of 59 eggs. J. O. LeFevre's White Leghorns, from New Platz, New York, were second with 55 eggs, and Archie R. Colburn's Rhode Island Reds from Hollis, New Hampshire, were third with 54 eggs. Fourth place was hotly contested, their being five pens that each laid 53 eggs for the week. These comprised Barred Rocks from New York, White Leghorns from New York, New Jersey and Pennsylvania, and Oregons from the agricultural college at Corvallis, Oregon.

In reporting the thirty-second week of the contest attention was called to the fact that the Oregons just mentioned were giving the leading pen a run for its money. During the past three weeks this pen has gained a total of 22 eggs on the leaders, which is practically an egg a day. If they continue to gain at this rate they will be just three weeks getting into first place.

With the coming of the hot weather season the poultryman's problem is not so much how to get more eggs this week than he did last, but rather to recognize the fact that the hens will yield less eggs from this time on to the end of the laying season. Good care and management during the summer means that the falling off in yield should take place gradually instead of abruptly.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 1359; Tom J. Adamson, 1292: Richard Allen, 1280.

White Wyandottes

Obed G. Knight, 1443; F. W. Harris, 1243; Brayman Farm, 1234.

Rhode Island Reds

Richard Allen, 1341; Pinecrest Orchards. 1221; Allan's Hardtobeat Reds, 1131.

White Leghorns

J. O. LeFevre, 1329; Braeside Poultry Farm, 1303; Hollywood Farm, 1301.

Miscellaneous

Oregon Agricultural College (Oregons), 1422; H. P. Cloyes (Buff Wyandottes), 1224; Cook & Porter (Buff Wyandottes), 1177.

THE CALIFORNIA JAY AS THE KAISER'S ALLY

Written for California Cultivator By R. H. Vogt

Poultrymen in a good many sections of the country are greatly annoyed by the depredations of the California jay, whose ravenous appetite for eggs and young chickens not only makes him a nuisance but causes him to destroy a lot of the profits that should go to the poultryman as well as to eat the food that should help supply us and our allies.

According to the reports from some sections, young chicks as old as six weeks have been killed by this robber.

That these birds are not consciously giving aid and comfort to the enemy, but are only living true to species, we can readily see by reading the "habits and economic status" of the California jay as printed in the Farmer's Bulletin No. 513, prepared by the bureau of biological survey. Here we read:

"Robbing the nests of smaller birds is a favorite pastime, and he is a persistent spy upon domestic fowls and well knows the meaning of the cackle of a hen. Not only does he steal eggs but he kills young chicks. The insect food of this jay constitutes about one-tenth of its annual sustenance. The inclusion of grasshoppers and caterpillars makes this part of the bird's food in its favor. But the remainder of its animal diet includes altogether too large a proportion of beneficial birds and their eggs, and in this respect it appears to be worse than its Eastern relative, the blue jay.

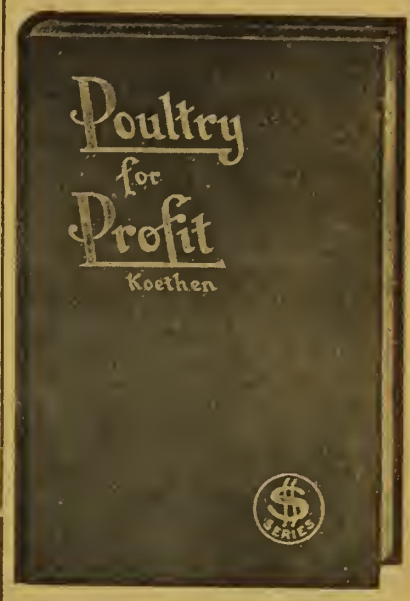
"While its vegetable food is composed largely of waste, at times its liking for cultivated fruit and green makes it a most unwelcome visitor to the orchard and farm.

"In conclusion it may be said that over much of its range this jay is too abundant for the best interests of agriculture and horticulture."

ORPINGTON CLUB YEAR BOOK

The Orpington Club of California has issued the year book for 1918. Officers of the association are: President, A. G. Goodacre; vice president, P. W. Likins; second vice president, A. J. Hoffman, Jr., secretary, L. C. Geiser, San Gabriel.

Poultry can be made to Pay



THERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe.

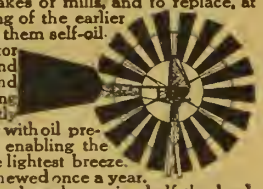
THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

THE SOLDIER'S MOTHER

He was so beautiful—my baby son..
His sun-kissed curls clung close around his head,
His deep blue eyes looked trustingly in mine.
I did my best to keep his beauty fair
And fresh and clean and dainty, for I knew
I never could be satisfied with less.

He was so strong and well, my little son!
I gave my days and nights to keep him so—
Called in fresh air and sunlight to my aid,
Good food and play, all healthful things of life.
I wanted physical perfection, for
I never could be satisfied with less.

He was so bright and clever, my big son!
I sent him to the very best of schools,
Denying self that he might know no lack
Of opportunity to do his best.
Or feel no door of progress closed to him.
I never could be satisfied with less.

And yet—but now—my well-beloved son,
For your perfection can I pay the price?
Or would I have you play the coward's part,
With selfish, shriveled soul too small to dwell
Within so fair a frame? Is that my choice?
I sought the best! Shall I be satisfied with less?

Nay, I would have you honorable, my son—
Just, loyal, brave, and truthful, scorning fear
And lies and meanness—ready to defend
Your home, your mother, and your country's flag.
He's gone! Dear God! With bleeding heart I know
I still could not be satisfied with less!
—Sarah Benton Dunn, in New York Times.

WHO IS TO JUDGE?

D. H. Talmadge in Dumb Animals

A NUMBER of men drawn from widely-apart sections of the United State were gathered in the office of a country hotel in Oregon one stormy Sunday afternoon, and the talk was running along lines of food conservation, a "meatless Tuesday, wheatless Wednesday" announcement on the wall having served to introduce the subject.

There was no heat, no rancor, in the talk. Every man present was a patriot, ready and willing to do anything, to make any sacrifice, if the best interests of the nation might be served thereby. And so the conversation ran along, humorously for the most part, with anecdotes of "food-saving methods I have used" as its principal feature, until a man from Ohio, who had been half listening to the talk, half reading a newspaper, quite unexpectedly started something.

"I see it is proposed to kill the dogs," he observed quietly, his eyes upon the paper.

A tall man wearing a flannel shirt—a rough, hard-looking man, scowled alertly.

"What for?" he asked.

"Same old thing. The food they eat will be needed by more important factors in the war. A dog, the average dog at least, is a no-account thing anyway." Thus the man from Ohio.

He of the flannel shirt muttered something suspiciously like an oath, and his eyes shone with an aggressive light.

"There may be now and then a dog that would be better dead," he said. "The same thing's true of men. Listen, you gentlemen. If there's going to be much talk here about the dog-killing proposition I'll go out for a walk in the rain till you get through. Kill the dogs—humph!"

A man from Fort Worth winked covertly. He was a newspaper representative and he scented a story. Plainly the man of the flannel shirt had a reason. The reason might be interesting. Wherefore—

"You are in the dog business maybe?" he drawled.

"I am not. I'm in the ordinary everyday common justice business. I'm no dog crank. I want the dog to have a fair deal, that's all. I reckon the average dog will hold his own for services rendered with the average man. He's got his rights. Conserve his food if it is thought necessary, but kill him—why, it's diabolic to think of."

"Oh, I don't know," drawled the man from Fort Worth, provokingly.

"Well, I know. Listen, you gentlemen." The tall man loosened his shirt at the neck. "I live in Saskatchewan when I'm at home. Own four hundred acres, big barn, little house, two hundred head of stock, and one half-breed collie dog with fleas. I never cared much for dogs. This one followed me home from town one day about two years ago. I tried to drive him back, but he wouldn't drive. He knew my need of him, I reckon, better than I knew it myself. Once or twice I thought of killing him during the following year. He was a barker—musical as the devil, and he brought dirt and fleas into the house, and was altogether a nuisance. He wouldn't have been, of course, if he'd been properly appreciated and trained, but he was only a dog and had to do the best he could. I don't believe he'd have lasted long on the place if hadn't been for the baby. She was a year old, and from the first she loved that dog and the dog loved her. Seemed to understand each other. The youngster's sense of divine worth was keener than mine. Did it ever occur to you that so-called mature intelligence is somewhat of a joke? If it wasn't there wouldn't be so many folks down on dogs maybe. I got my jolt one morning last fall, and right away afterward I went to town and bought that dog the best collar I could find. I didn't call it a collar either—I called it a halo.

"I'll hurry over the story. It makes me sweat cold to think of it, and I know all right that one man's trouble stories are never interesting to other men. I'd gone to the barn to do the chores after building the kitchen fire. I heard a scream from the house. I hurried to the barn door just in time to see my wife run from the kitchen, her clothes blazing. The back end of the house was in flames.

"Yes, I reckon you've guessed it, gentlemen—my wife had poured coal oil on the fire to hurry the breakfast. She should have known better, but that's neither here nor there. I grabbed a horse blanket and threw it about her and rolled her on the ground, and then I thought of the baby and started for the house. And at that instant the wind sent a great cloud of smoke toward me and everything was bitter dark.

"It seemed hours before the light came to my eyes again, and during that time I knew the agony of despair. And then, when all hope had died within me, I heard a bark. It wasn't a wail or a howl, but a note of cheer. I sensed that quality in it. In a vague way it comforted me, for it spoke at least of companionship in my sudden misery. I struggled forward, trying to rub sight into my stinging eyes.

"The wind whirled again, and I could see the house. I noted in that first blurred glance that it was doomed, with everything in it. But the baby—God be praised!—wasn't in the house. The baby, gentlemen, was sitting on the ground at a safe distance from the fire, and there was laughter on the blessed, tear-stained little face, and there was laughter, or something like it, on the face of the dog that stood beside the child. I could read the story in the tooth-torn clothing. The dog had dragged the little one to safety.

"Later, when my wife had begun to recover from her burns, I learned that she had left the youngster on the floor in the front room while she went to the kitchen and she had chased the dog out of doors before she did so. But when she told the story her bandaged arms were around his shaggy neck and her tears were dropping on his head."

The man was silent for a moment, his eyes closed. No one spoke. The man from Ohio rolled up his newspaper and tossed it under the stove.

"Tell me, gentlemen"—the eyes of the man from Saskatchewan opened again—"who is to judge which dogs shall be killed. If anyone should wantonly kill my dog I'd call it murder. Who is to judge?"

No one replied. The man from Ohio stood up and walked to the window.

"It's raining harder than ever," he said noncommittally.

The Cultivator Patterns

8413—Ladies' Waist. Cut in sizes 36, 38, 40 42 and 44 inches bust measure. The fronts are gathered to the back, which extend over and gives the effect of a yoke.

8843—Stout Ladies' Waist. Cut in sizes 42, 44, 46, 48, 50 and 52 inches bust measure. The back extends over the shoulders and the fronts are gathered.

8818—Ladies' Dress. Cut in sizes 36, 38, 40 and 42 inches bust measure. The waist is all in one at the front, and the U-shaped neck is finished with a roll collar.

8571—Girls' One Piece Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The dress may be made with or without the belt, but if it is used it passes under the plaits.

8839—Girls' Dress. Cut in sizes 4, 6, 8, 10, 12 and 14 years. A tiny roll collar finishes the V-neck.

8568—Ladies' One Piece House Dress. Cut in sizes 36, 40 and 44 inches bust measure. The dress hangs straight from the shoulders, but a narrow belt gives it a more graceful appearance.

8432—Ladies' Yoke Skirt. Cut in sizes 24, 26, 28, 30 inches waist measure. The skirt has a hip yoke with a straight, one-piece lower section gathered to it.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

Food

TAPIOCA IN NEW DISHES

Those who gloried in the food adventures of "The Swiss Family Robinson" remember them as true conservationists. They used no wheat flour, ate the perishables, used local supplies, and laid by ample food reserves for lean seasons. The "Home Card" might well have hung from the window of their tree-house. The discovery of a "substitute" flour on this wheatless island was worth the excitement it created. You remember how they pounded the cassava root and produced a flour from which the mother made a sweet loaf.

Cassava flour is used today in tropical countries and has about the same food value as wheat flour. A familiar product from this same root is tapioca, high in food value, and useful because of its starch content in giving body to many dishes, some of them perhaps new to housekeepers. In the recipes given below use quick tapioca.

Duchess Soup

One-half onion, two tablespoons fat, two tablespoons tapioca, one quart milk, one egg or two egg yolks, three-fourths cup grated cheese, one teaspoon salt, paprika.

Cook the onion in the fat until tender but not brown. Remove the onion, add the flour, then the milk gradually, saving out one-fourth cup. Add the tapioca and seasonings and cook 15 minutes. Pour the soup over the egg, beaten with one-fourth cup of cold milk. Add the grated cheese and serve immediately.

Tapioca may be used for thickening soups, gravy and white sauce. Cook the white sauce in a double boiler allowing one tablespoon of tapioca to one cup of milk.

Tapioca Griddle Cakes

Two cups milk, two tablespoons tapioca, one egg, one-half teaspoon salt, three-fourths cup rice or corn flour, two level teaspoons baking powder.

Cook milk and tapioca in double boiler 15 minutes, add beaten yolk of egg and cook until mixture thickens like custard; cool and add beaten white and whip in well; add flour and baking powder. Bake on griddle and serve piping hot with butter and honey.

Minute Rabbit

One pint milk, three tablespoons tapioca, one cup cheese, one egg well beaten, one-half teaspoon mustard, one-half teaspoon salt, pepper or paprika to taste.

Scald the milk in a double boiler and when hot add the tapioca. Cook 15 minutes; then add the cheese cut into small pieces. Stir constantly till the cheese is melted, add the well-beaten egg mixed with a little cold milk, the mustard, salt and pepper. If desired, this may be turned into a baking dish and baked until brown.

Fruit Mold

Three level tablespoons tapioca, two tablespons sugar, one pint milk, one teaspoon vanilla, one-half pint cream.

Heat the milk in a double boiler, add the sugar, stir in the tapioca, and cook for 15 minutes. Pour into a bowl to cool; then fold in the whipped cream. Ornament with fresh berries, chill and serve.

RHUBARB COOKED TO CONSERVE SUGAR, FLAVOR AND HEALTH

By M. L. Berneike

Parboil the rhubarb as follows: Cut it into one-half to three-quarter inch lengths and cover it with two or more times its own bulk of cold water. Put it on the stove and let it come to boiling, which continue two or three minutes or until the rhubarb begins to pale but not fall to pieces. Drain off all the water, barely cover the balance with boiling water and continue boiling until thoroughly cooked. Add sugar to taste and remove immediately from the fire.

No more sugar is required than for good apples and the flavor is rich and delicious. More or less acid may be removed by varying the amount of parboiling water. Do not peel rhubarb. Its finest flavor lies in the exterior. If wanted for pies do not add water after removing the parboiling water but put the rhubarb directly into the pies.

The parboiling water is good to whiten the hands and soften the skin.

HOW TO KEEP FLOUR AND MEAL

Hot weather frequently produces spoilage in certain flours and meals if they are not properly cared for, especially those which contain a high percentage of fats, moisture or the outer coatings of the grain. To prevent such losses, particularly at this time when bread stuffs are so essential to the Allies and ourselves, the following instructions for the storing of these flours and meals are given:

Buy in small quantities.

See that flours and meals are in good condition when purchased.

Keep in cool, dry place.

Use tins or covered jars for containers, scalded and perfectly dried.

It is well to use two covered containers alternately, always putting fresh purchases in a clean container and never mixing the residue from the previous purchase with the fresh purchase.

ONLY BIRDS, BUT—

Written for California Cultivator
By Mrs. H. C. Wallace

Early this spring a pair of Bee-Martins or King Birds as some call them, took up their abode with us. Our place is new and the trees young, so when nesting time came the birds looked the place over. I saw the female carrying pieces of string for a day or so and then I discovered they had settled on a location. The trees simply wouldn't do as we have cats, so they had spied our wire calf muzzle or "weaner" hanging by the head strap on the end of a rafter of an open shed about six feet from the ground. In this they built a perfect nest. Now there are five spotted eggs and soon we will see those little downy heads above the edge of the nest. The male comes and sits on the wire above his mate and they hold their conversations while swinging in the breeze, the rest of his time is taken up trying to put fear in the cats and dog as well as myself.

Any one who loves nature and outdoor life would, on seeing this, realize the wisdom of these little birds and would protect them as I am doing and will the babies.

IN FLANDERS FIELDS

The writer of this, one of the most beautiful of the poems inspired by actual service on the battle front, is himself dead in Flanders fields. Many Cultivator readers will remember reading the verses in our issue of November 10, 1917. They have been widely coppied in papers the country over, originally appearing in Punch. The writer was Lieut. Col. John C. McCrea of the British forces serving in Flanders:

In Flanders Fields the poppies grow
Between the crosses, row on row,
That mark our place, while in the sky
The larks, still singing bravely, fly
Unheard amid the guns below.

We are the dead. Short days ago
We lived, felt dawn, saw sunset's glow,
Loved and were loved, and now we lie
In Flanders Fields.

Take up our quarrel with the foe;
To you, from failing hands, we throw
The torch, be yours to hold it high,
If ye break faith with us who die
We shall not sleep, though poppies blow
In Flanders Fields.

SOUTHERN PROSPERITY SONG

When we have spareribs,
For to chew,
We don't have spare ribs
Showing through. . .

DOING HER BEST

"No," remarked an indignant lady to an indignant cabman who had received his legal fare, "you cannot cheat me, my man. I haven't ridden in cabs for the last 25 years for nothing."

"Haven't you, mum?" replied the cabman, gathering up the reins. "Well, you've done your best!"

HAY

Under date of July 6, Scott, Magner & Miller says:

Hay receipts in San Francisco past week, 1483 tons.

Arrivals continue much below normal for this time of the season and consequently the market is a trifle firmer. Reports from the interior intimate that while baling is still backward the next week will show much more activity in baling operations in many sections, and the next few weeks should show increased arrivals.

Farmers are still reluctant about selling their hay until they can secure presses and crews to bale and continue either to hold their crops at extremely high prices or refuse to place any valuation on their hay until baling operations commence.

Alfalfa remains very firm. Arrivals have been extremely light during the past week.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:
Fancy Wheat Hay
(light 5 wire bale) .....26.00@27.00

Boston: 4 Val., 2 lem. Val. 3.50-6.90, lem. 5.50-6.85.

MARKET NOTER

Los Angeles, July 9, 1918.

The Los Angeles branch of the bureau of markets of the United States department of agriculture gives the Cultivator the following notes on the week's markets:

Cantaloupes

The week witnessed the first arrivals of local Tip-Top cantaloupes in small lots which sold around $3.00 for standard crates. The supply of Arizona cantaloupes is practically cleaned up. Shipments from Imperial County are very light and of inferior quality. However, stock in fair condition is meeting a ready demand and moving at slightly higher prices than last week.

Potatoes

Receipts of home grown new potatoes continued quite heavy on the local market but a slightly stronger feeling is shown by the week's trade. White Rose stock in lug boxes jobbed at from 40 to 55 cents per box, with sack potatoes running from $1.40 to $1.50 per hundred. Practically all supplies of old potatoes are cleaned up. Carlot shippers have felt a more active demand from Eastern and Northwestern markets, and prices for carlots f. o. b. Southern California shipping points, when well graded, have advanced to $1.75, with a few sales of extra fancy stock at $1.85. Much ordinary stock poorly graded was sold around $1.65. With field digging lighter than was expected, it is believed the present movement of from 50 to 60 cars per day will exhaust the supplies of the present crop in the near future.

Cherries

The best large size Royal Anne cherries from Watsonville met with active demand, running from 15 to 20 cents per pound. Many lots of smaller or inferior quality showed a wide range from 8 to 15 cents and as the week closed with lighter receipts fancy stock brought corresponding higher prices, some sales being made as high as 25 cents per pound. A few ten pound flats of Oregon cherries sold on the market this week.

Onions

With the cleaning up of the Bermuda onion season in Coachella the supplies in the local market have been very light but entirely sufficient to meet the demand. During the week the first arrivals of Stockton Yellows appeared and jobbed at $1.90 to $2.10 per hundred pounds. This stock is of rather ordinary quality and condition and some arrivals badly heated. Local Silverskin white onions are being hauled in and meet with a fair demand around two cents per pound.

California and Virginia are the largest shipping states at this time.

Shipments of Georgia peaches average around 200 cars per day; during the past week 1649 cars were shipped. They ruled fairly steady in Northern markets at $2.00 to $2.50 per four basket carrier; $1.75 to $1.80 per six basket carrier last week; for the same week last year the price was $2.25 to $3.00; the year before, $1.50 to $2.25.

The volume of apple shipments is more than double that of the corresponding day last year.

The Los Angeles branch of the bureau of markets will begin daily issuance of a bulletin on grapes. The movement of Thompson Seedless has started.

The New Mexico state agent estimates the crop of cantaloupes at 90 per cent of normal and the stand at 95. The first car will roll by July 25. The outlook is for a total production of 110 per cent of last year's output and an average yield of 500 crates per acre is expected.

Watermelons

The first car of Ariconas was shipped this year on June 12, as compared with June 14 and 15 in 1917 and 1916 respectively. As reported by the field agent, 40 cars had been shipped up to July 5. The average price to growers for this season to date has been $35; last year $22.

Arizona Potatoes

Shipments will be finished the second week in July and will not reach the original estimates of 60 cars, according to reports from the field agent. Shipments in 1916 and 1917, respectively, were 37 and 87 cars. Fifty cars are now expected. Prices to growers have been 1½ cents to 1¾ cents.

A better yield of Colorado cantaloupes is in prospect than last year and carlots from this district are expected to roll by August 28. Four hundred and fifty cars are looked for from this district.

Forty or fifty cars of Iceberg lettuce for July shipment are expected from the Seattle district this year, against 15 cars last year.

Southern California

The supply of good quality cantaloupes from most districts in the Imperial Valley is about exhausted. Labor has been scarce and expensive. Increased freight rates will probably result in a lighter acreage next year.

Movement of the potatoes in the Fullerton district of Orange County is practically finished and San Fernando Valley is now at the height of its season. The yield is given as 50 per cent of normal. The price to growers is $1.40 per hundred.

The condition of Central California tomatoes is estimated at 82. In the Sacramento district the acreage did not reach expectations and the stand and growth is very irregular in many fields. In parts of Santa Clara County soil moisture has been deficient; wells have been lower than ever before, and irrigation water has not been available for all fields. In the Mountain View district fields are looking well, and a reporter controlling 800 acres is expecting 15 tons per acre, against 12 tons last year.

A special reporter estimates the condition of the Turlock crop of cantaloupes at 65 per cent of a year ago. The season has been very different from last year, but both seasons have had unfavorable conditions to contend with. In view of the increased acreage in parts of the San Joaquin Valley a fairly heavy output is still in prospect.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, United States department of agriculture, report is made of the following shipment of cars of products from California for the week ending July 8: Apples, 5; apricots, 59; beets, 1; blackberries, 2; cabbage, 6; cantaloupes, 3; carrots, 5; cherries, 19; dried apples, 1; dried apricots, 1; dried beans, 6; dried peaches, 1; dried pears, 1; dried potatoes, 4; grapes, 7; lettuce, 5; logan berries, 15; mixed fruit, 45; mixed vegetables, 19; mixed fruit and vegetables, 12; onions,. 105; peaches, 15; pears, 6; peas, 1; plums, 393; potatoes, 491; raisins, 15; tomatoes, 6; watermelons, 8; Arizona: cantaloupes, 224; watermelon, 5.

WHAT TO DO IF BITTEN BY A RATTLESNAKE

Since the rattlesnake is more or less common in many parts of the United States every one should know how to deal with snake bites.

The following treatment has been outlined by one of the best reptile authorities in this country:

First, shut off the flow of blood towards the body to prevent the venom attaining access to the general system. Second, enlarge the puncture with a sharp knife and endeavor to drain away the surrounding poisoned blood. Incisions slightly deeper than those made by the fangs should be made directly across the primary wound and about an inch in length. The flow of blood should be hastened by the suction of the mouth. Third, wash out the wound thoroughly with a strong solution of permanganate of potash.

While these precautions are being taken send for a good doctor. After the wound has been thoroughly washed and bled, the ligature should be loosened slowly and bleeding from the wound again stimulated as the blood is allowed to circulate in the wounded part.

Whiskey may be given in frequent small doses to stimulate the heart and combat the paralyzing action of the venom. In large doses it benumbs, reducing the system to a condition most susceptible to the action of the poison, In a great many deaths from rattlesnake bites, so called, the symptoms of alcoholic poisoning have been more pronounced than those of snake bite.

"This important fact should be understood that an arm or leg bitten by a poisonous snake is very susceptible to common blood poisoning, owing to the deadening effect which the venom produces upon the organisms in the blood that combat germ life." —Alfred Westfall, Colorado Agricultural College.

NEW BUILDING READY FOR STATE FAIR

Work on the new $300,000 Horticultural and Agricultural Pavilion at the state fair grounds at Sacramento is being rushed so that the structure may be ready for occupancy for the 1918 fair which will open on August 31. One of the cattle barns is being moved on to the newly acquired five acre tract at the south end of the grounds. The horse show tent will also be moved to this location. Altogether there is to be a far better arrangement and grouping of exhibits this year. The machinery hall is being put into shape for the vocational department, which will have an extensive exhibit.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Stock in Pasture

What rights has an owner of pastured stock when the agreement was that the stock be brought home on call and there have been three demands for the return of the stock. Four months have elapsed since the third demand, and the stock is not yet home?—Subscriber, Owensmouth.

Depending upon the proof of the contract, the owner could doubtless hold the pasture keeper for the loss which the owner has suffered by not having the stock brought home within a reasonable time after the first call.

Settling Estate

If a widower having several children, some in this country and some in foreign lands, makes a will leaving his property to two of his children in this country and does not mention any of the others, is it necessary to secure releases from those not mentioned, provided they make no formal protest to the probate of the will, as it reads?—Subscriber.

The will, if properly executed, is entirely valid as far as it goes and would not be subject to contest merely upon the grounds stated. The trouble is that it does not go far enough to provide for a proper decree of distribution and that is where the objection upon the part of those children not mentioned would come in. Under the statute, by failure to provide for or mention the children, the children not mentioned claim their share under the law just as though there had been no will at all in so far as they are concerned. It would, therefore, be absolutely necessary either to procure such releases, or have their share set aside to them.

Hours of Labor

What are the laws relative to hours of labor for children and women on farms? How long is the day and how much overtime is allowed?

The act regulating the hours of labor of women contains a proviso excluding from the operation of the act the harvesting, curing, canning, or drying of any variety of perishable fruit, fish or vegetable. The act provides that in no manufacturing, mercantile, mechanical establishment, laundry, restaurant, telephone, telegraph, or transportation company shall women work more than eight hours per day, or for 48 hours per week. Nothing is said, other than the above exclusion from the operation of the act, as to farm work. Under the act providing for an industrial welfare commission, the commission, after a hearing of the conditions prevailing in any industry, are authorized to fix the minimum wage to be paid to women and children in such industry and also to fix the maximum hours of labor, which shall not be more than hours above stated. Minors 16 years of age or over are permitted to work at any agricultural, horticultural, viticultural, or domestic labor during school vacations and after school hours. It would thus be necessary for you to write Industrial Welfare Commission, Sacramento, in order to procure a definite answer to your question, if they have determined the matter.

Production and self-denial are the guns that will beat the Huns.

SWAP YOUR TIRES?

Do you know that your right rear tire wears faster than the other three? Well, it does. Have you ever stopped to think of the reason for it? The answer is furnished here by the B. F. Goodrich Rubber Company, together with some timely advice on interchanging tires to realize maximum wear from your entire set.

Since your power and traction come from the rear wheels your rear tires get the hardest wear. You drive on the right side of the road and roads are crowded—your car, nearly always, is slightly tilted—more weight being on that side, therefore your right rear tire takes hold first and bears more traction than the left rear.

When in motion the left rear tire rolls along comfortably on the smooth middle portion of the road, while the right rear gets the rough going on the off-side—the sharp edges of the asphalt, the rocks and ruts and is more likely to encounter objects thrown on the side of the road. Then again the rear tire bears the brunt of the stopping, sometimes sliding—a majority of the wear falling on the right rear.

The tire receiving the next hardest usage is the left rear, then the right front and last the left front. So when your right rear begins to show signs of wear, and you wish to spare it, put it on the left front wheel. And likewise change your left rear to the right front.

ALFALFA LAND FOR DAIRYING

Also first-class Orchard, Bean and Sugar Beet land. Twenty acres and up with easy terms of payment.

BRENTWOOD IRRIGATED FARMS, In Contra Costa Co., 63 Miles from San Francisco For Price and Descriptive Matter Address

BALFOUR, GUTHRIE & CO., LAND DEPT., 350 California St., San Francisco

Know Live Stock

Characteristics of every breed—best methods of breeding, training and general care with specific directions on how to buy and sell are given in this best of all LIVE STOCK and COMPLETE STOCK DOCTOR BOOK, a 1400 page Cyclopedia of Live Stock for the Western Rancher and Stock Owner.

This is without doubt the greatest book value on the subject ever offered to readers of this paper. It is the only work of reputable competent authorship covering these important subjects, recommended for general popular use, as a safe guide for the farmer and stock owner, by educated surgeons and by the press. The author, A. H. Baker, M. D. V. S., was the founder and for 27 years Dean and Professor of Theory and Practice of Veterinary Medicine, Chicago Veterinary College.

A great book of 1400 pages.

If you would know all about Horses, Cattle, Swine, Sheep, Goats, and Poultry, their anatomy, with careful and illustrated analysis of the points of Domestic Animals with all the diseases to which they are subject, with remedies for the curable diseases, send for this great book. It explains by methods of object teaching, with written instructions, how to know diseases in domestic animals, the causes, prevention and cure.

Information and instruction are given in plain simple language free from technicalities, but scientifically correct. The remedies prescribed are readily obtained and easily applied.

Over 30 color plates and 1000 object lesson engravings, including one illustrated chart for accurately telling the age of the horse from six months to twenty-nine years old.

The Book, Livestock and Complete Stock Doctor, is published in a single neatly and durably bound volume of 1400 pages 6½x9½, weight seven pounds and bound in law sheep. A new copy will be sent complete to any address in the United States upon the following terms:

One subscription to California Cultivator at $1.00 and $6.00 in cash.
Two subscriptions to California Cultivator at $1.00 each and $5.00 in cash.
Four subscriptions to California Cultivator at $1.00 each and $4.00 in cash.
Five subscriptions to California Cultivator at $1.00 each and $3.00 in cash.
Six subscriptions to California Cultivator at $1.00 each and $2.50 in cash.
Twelve subscriptions to California Cultivator at $1.00 each with no additional payment.

This is an easy manner in which to obtain this useful and valuable book. Get up a club of 12 subscriptions to California Cultivator among your neighbors or send part subscriptions and part cash as above and you will find that the book will pay for itself in satisfaction to you many times over. We will refund money on return of book in good order if the book is not as advertised.

The International 8-16
A Handy Tractor

A FEW minutes in the seat of an **International 8-16** gives you a new idea of the ease and comfort of doing farm work with a kerosene tractor. All the controls are right at hand—spark and throttle controls just under the steering wheel; clutch and brake operated by foot pedals; speed changing levers just where your hand falls on them—everything as handy as on an automobile.

International 8-16 has one reverse and three forward speeds: 1¾ and 2½ miles per hour for plowing, disking and other field work, and 4 miles per hour for road work and when traveling from one job to another.

You will like this tractor when you see it. When you run it you will like it better. When you find out how light your bills are for kerosene and for general upkeep you will like it best of all. Go to the dealer soon and see it or write us for information because it looks as though the demand for **International 8-16** tractors is going to be much heavier than we expected and we shall have to fill orders in their turn.

Farm for Profit
and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The Sacramento Valley was at one time the greatest grain field in the world. Some grain ranches were so large that it required days to drive about them. Conditions are changed, and the great tracts are divided up into parcels, and fruit and other products planted. This has meant a material increase of food products and a material loss of the picturesque. Then came rice, and today we are producing $10,000,000 worth.

LAND SETTLEMENT

Now comes the state of Washington with the organization of a state land settlement association, with many references to the "up-to-date system of land settlement adopted by California" and an appeal for its installation in that state. Dr. Elwood Mead, head of the land settlement commission in this state, recently made address before conference of representative Washington people, and it was resolved "that, next to winning the war, the adoption of a sound land settlement policy is the foremost economic problem before the American people."

USE OUR ROADS

Freight rates have now been advanced 25 per cent; passenger fares are now made under the new schedule of three cents per mile; the transportation service is needed to a greater extent than ever in meeting war demands. The people are aiding by growing at home as much food as possible. The automobile and the truck are uniting in saving transportation service, and it all goes to prove that patriotic service has been rendered by our good roads boosters who have been laboring for nearly a score of years for better roadways. There are all too few of these improved roadways for best of service, but they are increasing and capacity to use them is also increasing. Presumably the truck and the auto will be called upon to bear their proportion of war costs, and the new war revenue bill will probably "touch" both these useful vehicles. But they will be found ready to do their share.

COOPERATE

The "open day" for selling dried fruit has arrived, and still there is little activity. Growers are hoping that the next few days will see material improvement. Meantime it is in order to call attention to the need for more general cooperative effort as to next year's crop. The cooperators have certainly an advantage in crop disposal, and this is a good time to remind independents of their duty to themselves and to their industry.

Food Administrator Merritt has been quoted as saying:

"There is no reason, at the present time, why the packer should not contract for the crop. The government needs a large pack of canned fruit and vegetables, and any attempt to create uneasiness in the mind of the producer, or any attempt to limit the pack in quantity and quality, is contrary to public interest. It is the view of the food administration that the packing industry should take immediate steps to clear up this situation."

RETURN POSTAGE

Practically every issue of the Cultivator contains some item of interest to readers of the Cultivator, regarding which they wish further information. Quite often they wish to know the name and address of the writer of a certain article. One such item recently appeared which brought to this office many letters of inquiry as to writer's address — a matter of interest to the inquirer only—this almost invariably without return postage. These inquiries have all been answered, sometimes at a cost of 30 to 40 cents per day for postage — a matter too small to refer to but amounting to a considerable sum in a year. When the inquirers write to this contributor for specific information we trust the return postage will be enclosed.

Where one is writing to an advertiser regarding his own business there is no call for return postage, but where the reply is merely an expression of good will the enclosure of postage is only what is due the one of whom the favor is asked.

SAVE GAS

Without question the federal government will be compelled to take a stronger hand in the matter of saving fuel. The fuel administration has announced that the ever increasing demand for gasoline to supply airplanes, motor transports and other overseas uses, in addition to abnormal demands at home, is making severe inroads on the supply. "The abnormal waste which characterizes the use of gasoline in motor propelled vehicles, however, must be brought to an immediate halt. Legitimate use of gasoline for internal combustion engine fuel does not mean that gasoline may be handled wastefully. The present method of distribution of gasoline is extremely wasteful, the product being handled carelessly and without the slightest regard for conservation in thousands of garages and supply stations throughout the country. The fuel administration is urging everyone concerned in the production, distribution and consumption of gasoline to eliminate every possible point of waste. Unless this is done, the present supply may in a short time become an actual shortage. If this condition develops the fuel administration will not hesitate to make effective enforced conservation methods, which, however, up to the present have not been necessary."

KEEPING FIT

The commission on training camp activities will soon issue a book, "Keeping Our Fighters Fit—for War and After." In the prefatory note President Wilson says:

"I do not believe it is an exaggeration to say that no army, ever before assembled in history, has had more conscientious and painstaking thought given to the protection and stimulation of its mental, moral and physical manhood. Every endeavor has been made to surround the men, both here and abroad, with the kind of environment which a democracy owes to those who fight in its behalf. In this work the commissions on training camp activities have represented the government and the government's solicitude that the moral and spiritual resources of the nation should be mobilized behind the troops. The country is to be congratulated upon the fine spirit with which organizations and groups, some of them of national standing, have harnessed themselves together under the leadership of the government's agency in a common ministry to the men of the army and navy."

This war has developed more than any other the fact that there is great military value in a clean, wholesome fighting force with wholesome surroundings.

WHEAT PRICES

The Cereal Division of the Food Administration, formerly the U. S. Grain Corporation, has announced:

No. 1 wheat of the Northern spring, hard winter, red winter, Durum, and red white grades will be sold in the various markets at the following basic prices:

New York, $2.39½; Philadelphia, $2.39; Baltimore and Newport News, $2.38¾; Duluth, $2.22½; Minneapolis, $2.21½; Chicago, $2.26; St. Louis, $2.24; Kansas City and Omaha, $2.18; New Orleans and Galveston, $2.28; Tacoma, Seattle, Portland, Oregon, Astoria, San Francisco, and Los Angeles, $2.20.

The price basis for No. 2 wheat will be three cents below No. 1, and for No. 3, four cents below No. 2. Grades below No. 3 will be dealt in on sample.

Special classes of wheat will be sold on the following schedule: Dark hard winter, two cents above hard winter; dark Northern spring, two cents above Northern spring; amber Durum, two cents above Durum; yellow hard winter, two cents under hard winter; red spring, five cents under Northern spring; red Walla, seven cents under red winter; red Durum, seven cents under Durum; soft white, two cents under hard white; white club, four cents under hard white.

This Week's War Notes

It is reported that typhus is existent in some sections of Germany.

The North Sea has been mined so completely that submarine activity is greatly curtailed.

Dispatches from Athens refer to insurrection in Turkish forces and killing of German officers.

An American submarine in action with U-boat sunk the enemy and its crew excepting two captured.

Allied troops, including Americans, now occupy positions in extreme Northern Siberia, in fact, within the Arctic circle.

Quentin Roosevelt, youngest son of ex-President Roosevelt, was shot down last Sunday. He was a lieutenant in the American aviation service. His machine fell in flames behind German lines near Chateau Thierry.

President Wilson has written a letter to the chairman of senate foreign relations, urging appointment of commission to investigate conditions in Russia. Daniel Willard will be appointed by the president if commission is selected.

The victory of the Italians and Allies in Northern Italy appears to have been more complete than first reported. The Italian troops are now resting and repairing lines. The observation of July 14th in commemoration of the fall of the Bastille was general in all parts of the United States.

Amsterdam reports that Vienna's daily food ration has been cut to eight ounces, three ounces of which may be bread or flour substiutes, one ounce wheat, two and a half ounces potatoes, balance of fat, jam and war coffee. Flour is $4.50 to $5.00 per pound; beef, $5.70 to $7.00; horse flesh, $3.55.

The Albanian advance is being held and it is considered a great advantage has been secured by the Allied forces. Owing to there being no roads, the advance is extremely slow. Connection has been made with the forces from Saloniki, and the Allied line now extends from the Adriatic to the Aegean. The most important town captured during the week was Berat with immense quantities of war material and many prisoners.

The Russian situation is improving slightly. The Allies have agreed to advance a billion dollars for restoration, and it is known that with a leader vast numbers of Russians will aid the Allies in repelling the Germans. Lenine's control has been entirely broken, and a complete defeat has been administered to the Bolshekivi in the Ural Mountains. Practically all of Western Siberia is now in control of the Czecho-Slovaks.

"The Yanks are coming" has thrown a fit into the ranks of the Teutonic shock absorbers. Early Monday morning after 33 days of preparation for a final Teutonic drive 420,000 shock troops made a drive on a ten mile front occupied almost entirely by American troops. Other attacks extended the battle line over 65 miles with over 800,000 in the attacking force. The first plunge resulted in indenting the American line to a depth of over two miles. The Yankees soon recovered and with characteristic yell made counter charge. At the same moment American troops on one flank near Chateau Thierry and on the other near Rheims endangered the entire German advance. The retreat was even swifter than the advance. Wednesday morning reports indicate complete American victory.

Is the Auto Necessary to Largest Production?

By California Contributors

LIFE is "one blamed thing after another" in the eyes of most of us these days of the war. Our daily life seems a succession of stumbling, or climbing, as the case may be, over one obstacle after another. We are all, however, travelling in one general direction, toward the right finish of the war—and the swifter the better. Crisis after crisis arises which calls for swift decision, each decision demanding on the part of those whose duty it is to make it an understanding of all the facts bearing upon the subject. This means almost superhuman intelligence; that we don't pretend to have; but we have the next best thing, collective intelligence, which we are ready to place at the disposal of those who are directing in Washington the present policies of our nation.

The essential thing now is to speed up all activities necessary to carrying on the war and to eliminate all that aren't. We must produce more food, with less power and get it to where it is needed as swiftly as possible—which brings us to the immediate question in hand:

The authorities at Washington are confronted by the necessity of greatly reducing the output of automobiles. Steel, rubber, everything entering into their construction is demanded overseas. Ships to move these supplies, especially rubber from South American ports, are needed to carry troops. The easy solution is "Americans should willingly give up their pleasure cars to aid the war," and, truly, Americans would. But are the cars all pleasure cars? Plainly not. For gradually the automobile has entered into life's necessities until any sudden change would mean loss of efficiency and loss even in food production. The powers that be at Washington want the facts. Will Cultivator readers aid in securing these facts?

The Cultivator is in a position to forward these facts to those who want them and where they will be used in making wise decisions. Will every auto owner who reads this act quickly. Answer these questions or such as may be answered or give any facts which will show the real usefulness of the auto in farm operations. Here are the questions:

Mileage per year?

Mileage percentage for pleasure alone?

Mileage percentage, business and pleasure combined?

Mileage percentage solely for business?

If necessary to discontinue use of auto entirely would purchase of vehicles or horses be necessary?

If horses are purchased, how much feed consumption?

Do you own a truck which will answer for business purposes?

Do you use trailer?

Consumption of gasoline per year?

Consumption of oil per year?

Distance from shipping center?

If use of auto prohibited can additional horses be purchased? Would it necessitate employing more labor?

And lastly, if necessary to restrict use of auto, to what extent could this be and not interfere with farm efficiency?

Above all, bear in mind: "What are the needs of our government? How may the war be quickest ended?"

If you cannot answer correctly all of the questions, give us all the information you can and fire it back quick.

Facts Already Gathered

As soon as this question was presented to the Cultivator a series of questions was sent, mostly to farm advisers, horticultural commissioners, and others in touch with farm operations. Answers to these are already coming. Here are a few of them:

G. W. Harney, Horticultural Commissioner, Yuba County

A careful enumeration will show that there are not over ten automobiles in Yuba and Sutter Counties that are used exclusively for pleasure purposes. On every farm there is a low priced machine as Ford, Dodge, Buick, etc. used for business purposes and to take the farm people and families to town and back. W. A. Beard, a prominent rancher in District No. 10 north of Marysville uses his Ford to carry cans of cream to market; John Morrison, rancher near Ostrom south of Marysville uses his Buick to carry supplies and tools to his ranch. Hundreds of other farmers use their machines for the same purposes.

Government agents have taken away from these counties all of the best horses and mules. It would be impossible to go back to the use of horse drawn vehicles. Tractors and trucks have replaced horses on the farms. A horse drawn vehicle is a rare sight on the highway or in the towns on market day. Sales and stocks of buggies have fallen to nil. Harness stores have gone into auto repairing work.

We have had active campaigns to bring idle lands in remote districts into cultivation of cereals and growing of live stock. Thousands of such acres have been brought in solely by the use of automobiles, trucks and tractors. To shut off or hamper in any way the supply of automobiles, low priced machines, or trucks will practically stop the production of food in Northern California.

If we could get more automobiles and better roads our production of food such as rice, wheat, oats, prunes, raisins, figs, olives and so on could be greatly increased in a very short time. We are producing enormous quantities of rice and beans. I ask you where would that industry land if we are deprived of the use of automobiles. Nothing should be done to discourage the growers who are engaged in the production of staple foods.

D. D. Sharp, Horticultural Commissioner, Riverside, County

You ask in your letter to name some farmers who are making use of their automobiles for transportation purposes to and from market, etc. If you still think you need this list of names I will attempt to secure it for you, but as it would be necessary for me to get the names of practically every farmer in Riverside County who owns an automobile, you will readily see that I should need a little time to get the names of several hundred automobile owners who use their machines as an absolute necessity in their farm work. I would not however, more than start to name them.

This statement might be doubted by a person who is not familiar with our conditions and the absolute necessity of the automobile in furthering farm work, but you know, as everyone else who is in close touch with our farm problems knows, that this is an actual fact. Any person who through lack of information regarding the usefulness of the automobile seeks to curtail its use or make its use more burdensome to the farmer than it is at present, might just as well curtail the use of horses or tractors and regulate the farmer back to the primitive ages and force the use of oxen in his farm work.

I fail to see that our farmers have very much time for joy-riding or other trips, they are too short-handed and too busy trying to raise the crops to help win the war as is asked by the federal government, and if they did manage to get an idle hour or two in which to take a rest and load their wives and families into the machine with them to get a little airing and change from the burdens of farm life, God knows it is their just due, and who would deny them this?

Snowcrest Creamery, Beckwith

R. C. Mercer, Pete Scalari, L. Guidici, L. D. Madelena, C. Pasquetti, Jack Folki, Joe Biaggi, Guido Ramelli, Frank Bolson, B. F. Roberti and Albert Ede use their cars for hauling cream and looking after other farm interests.

O. E. Bremmer, Horticultural Commissioner, Santa Rosa

It is a very common practice in this county of the small farmers, particularly the poultrymen, to use their automobiles in delivering their products to the railway station. Some of them employ two-wheel trailers which will ordinarily carry about 1000 pounds.

It would be impossible for me to say off-hand how many of these are used, but it certainly would reach over 100. It would be pretty safe to say that 90 per cent of the farmers of this county use their machines directly in hauling farm products to market or in looking after the interest of their farms.

E. O. Essig, County Agent, Ventura County

It would be rather difficult for me to give you exact names of people using their pleasure cars for farm business, especially with regard to the exact business which the car may be put to. I know that practically all of our farmers use their pleasure cars to bring home all the supplies which the family consumes, as well as carrying to market such small things as may be used in the exchange, such as dairy products, eggs, etc. In other words, the pleasure car in our farming communities is used for everything except heavy hauling which is ordinarily done by trucks or wagons.

E. S. Langford, Horticultural Inspector, Los Angeles County

Many of the citrus growers owing to cost of feed have disposed of their teams and are now hiring that work done by regular teamsters, consequently they need their cars for hauling their supplies, particularly groceries, as the grocers in Covina have discontinued delivery into the country. Also several of the growers now have trailers so that they can haul small loads (orange boxes, etc., in case of emergency). With few exceptions I would say that the automobile to the citrus grower is an absolute necessity, not a luxury.

Herman I. Graser, County Agent, Nevada County

The following farmers of this county, besides many others, own so-called pleasure cars and use them continually in their business of farming as follows:

Ed Piper, Rough and Ready, (Studebaker) regular cream delivery.

J. S. Corey, Grass Valley, (Chevrolet) hauling sacked feed and supplies.

M. B. Church, Rough and Ready, (Reo) hauling supplies to various ranches and to sheep camps. Children use car to drive 15 miles to high school.

Louis Johnson, Smartsville, R. F. D. (Ford) butter deliveries several times a week, children use car to drive nine miles to high school.

H. A. Miser, French Corral, (Ford) hauls supplies to ranch 15 miles regularly.

John Weyel, Rough and Ready, (Maxwell) peddles berry and fruit products from his ranch.

W. J. Sanford, Wolf, hauls supplies to ranch 20 miles from town.

Geo. Bennets, Rough and Ready, (Ford) hauls supplies and fruit.

W. G. Robson, Smartsville, R. F. D. (Cadillac) hauls supplies, cream, etc.

F. C. Longe, Nevada City, (Dodge) delivers $10,000 pack from home cannery.

Tom Casey, Rough and Ready, (Dodge) hauls supplies, feed, cream, etc.

A. L. Wisker, Grass Valley, (Ford) hauls supplies, repairs and makes many business trips in connection with various state committees, etc.

C. P. McAlmund, Peardale, (Chevrolet) has no horses, dependent upon car for supplies, repairs, etc.

L. Emrich, Grass Valley, R. F. D. (Dodge) hauls feed and supplies.

Phil Gordon, Rough and Ready, (Ford) delivers fruit, hogs, sheep, etc.

Under our conditions any farmer who tries to get along without a car of some sort is very foolish, from the fact that all our ranches are far from town and there is not a farmer in the county who is not dependent, more or less, on his car for supplies, repairs, and the marketing of products such as eggs, butter, fruit, berries, etc.

Eugene S. Kellog, Horticultural Commissioner, Santa Barbara County

I talked this over with some of the farmers yesterday and I find that it is a concensus of opinion that they could not run their farms without a machine. I found one man hauling fruit from his orchard with a Ford. This was at the C. Lillingston place in Carpenteria. Another farmer said he has run his Reo over 5000 miles and he and his wife had never had one pleasure trip in it. This was L. B. Cadwell of Carpenteria. I rode in town with Arthur Baulin the other day and he was hauling his melons to town in his Cadillac. He has hauled the mail for I think three years. He used to make several trips a day and has to haul about eight miles, so he saved much time. J. G. Williams of Goleta uses his car hauling fruit and produce and could not get from one ranch to another to do his business without a machine. Tom Emmons of Goleta hauls vegetables and fruit to town nearly every day in his Stude-

Agricultural News Notes of the Pacific Coast

Northern California

Humboldt County fair will be held at Ferndale, August 19-24.

American River prune orchards report heavy crop.

Colusa is marketing three and a half pound onions.

State Forester Homans suggests "fireless day" be observed by all campers in the mountains.

Yolo County apricots which were shipped East as fresh fruit have made remarkably fine returns.

Yolo County has 9000 acres of almonds, the largest acreage of any county in the state.

Yolo County is developing a great industry in the raising of carrot seed.

The Sonoma Valley Apple Growers' Union expects to market this year 30,000 boxes.

Rice growers are asking for a guaranteed price of $4.50 per cwt. for paddy rice.

A serious infection of foul brood is reported from the apiaries of Glenn County.

Hop growers of the Sacramento Valley are getting together to mature plans for the protection of their industry.

The Graton district of Sonoma County reports fine cherry and berry crops and early apples 90 per cent of normal.

State horticultural commission has ruled that salt grass may be shipped to the state from Utah providing certain regulations are adhered to.

Placer County supervisors have extended the $4.00 bounty on coyote scalps till the middle of October. This action was taken on the request of sheep and goat raisers.

Central Creamery at Ferndale, Humboldt County, is now manufacturing milk sugar. One hundred pounds of whey produces three and one-half or four pounds of milk sugar.

The Northern California Milk Producers' Association has taken over management of the Orland creamery and will make it the central churning station for the valley north of Williams.

Superintendent Harry Smith of the state insectary announces the introduction of a beetle from France and Switzerland which will check the gypsy moth which has been such a pest in the New England states.

Farm Adviser Christiansen of Humboldt County has announced that a federal engineer has been secured to make survey of Eel River to determine some practical method of controling the currents that yearly destroy many acres of farm lands along its banks.

An association of farmers from Butte, Glenn, and Colusa Counties have arranged to bring in 5000 Mexicans to help in the harvest in the rice, bean, and beet fields, after which the laborers will be sent to Imperial for the cotton harvest, then on to Arizona and back to Mexico.

Some damage is reported to the orange crop in the Sacramento Valley from excessive heat causing an unusually heavy drop. Horticultural Commissioner Mills of Butte County estimates the orange crop of the Oroville district at not more than 50 per cent of normal.

Central California

Work has begun on the new cotton gin at Bakersfield.

The cannery at Visalia is running on apricots.

Prof. H. J. Quayle has been conducting a school of fumigation at Lindsay.

The cannery at Exeter opened on apricots June 22.

Stanislaus County board of trade has been of material aid to farmers in securing farm helpers.

The packing house of the California Peach Growers' Association at Modesto is to be completed by August 1.

Tulare County reports the outlook for the coming orange crop as approximately 75 per cent of normal.

Minimum wage for male cannery employes has been fixed at 35 cents per hour for a ten hour day, and 42 cents for overtime and holidays.

Field Agent Kaufmann of the United States bureau of markets finds the bean acreage of San Joaquin Valley about the same as last year.

Sugar factory at Corcoran will open within a few days. It is estimated that the factory will have 70,000 tons of beets to crush.

Madera County has a new farm adviser to take the place made vacant by resignation of Adviser Birch. The new adviser is Edward Smyth.

The first delivery of fruit to the packing house of the Madera Fruit Growers' Association was made the last of June.

Growers have ruled that they should receive for the coming year's dried peaches 11 cents; price to jobbers f. o. b. Fresno 12.8 cents.

Cool nights have delayed Tulare County's cantaloupe crop. It is estimated the county will produce $3,500,000 worth.

The past year has brougbt the highest prices for oranges which have obtained since the inception of the industry in California.

The county farm bureau of Tulare County is appealing to the state university for a citrus expert who will give reason and prescribe remedy for the serious June drop of oranges.

W. B. Nichols of Dinuba has been named assistant manager of the dried fruit section of the federal food administration. He will leave for Washington soon.

Farm centers of Santa Cruz County are discussing advantages of pooling wool for direct sale to the government and pooling orders for bean and potato sacks.

Kern County is marketing its White Rose potatoes. Most of them are going to Kansas and Texas. Growers are getting $1.60 per sack f. o. b. Bakersfield.

The Stanislaus County board of supervisors has enacted an ordinance prohibiting smoking in fields, barns, warehouses or other places where inflammable crops are growing or stored. The smoker is subject to a $500 fine and six months.

The state council of defense has appointed a commissioner to direct the saving of grain and rice straw for cattle feed. W. D. Egilbert, former commissioner general of the Panama Pacific, has been selected for this work.

Southern California

Southern California has 64,000 acres in walnuts.

Elsinore's new cannery is now operating on apricots.

Anaheim has organized a farm bureau center.

San Fernando Valley reports plenty of help available for cannery work.

Pale Verde Valley has 17,000 acres planted to cotton.

Orange County's apricot crop is turning out about 40 per cent of normal.

Orange County canneries are paying 30 cents per hundred pounds for pitting apricots.

Orange County expects to harvest 750 sacks of beans this year. Limas and blackeyes are away in the lead.

The Narod district expects a big walnut crop and reports trees practically free of blight and aphis.

Orange County citrus growers expect to receive $8,000,000 for their 1918 crop.

Tomato growers are urged to spray with Bordeaux mixture as a repellent of the flea beetle.

Riverside County dairymen are working out a plan to secure cheaper distribution of milk thereby lowering price to consumer.

Imperial will begin cotton picking this month. The valley has 150,000 acres of cotton planted this year.

Huntington Beach reports a large acreage of winter cabbage being signed up.

It is stated that the walnut crop in the Whittier, Fullerton, Anaheim, and Santa Ana districts is about 50 per cent of normal and of very high quality.

Instruction in fumigation was given to orange growers of Santa Ana last Tuesday by experiment station experts.

The canneries at Hemet have started on apricots, with more help being offered than they can use. The apricots are running to small sizes.

Ventura's County fair is reported as making satisfactory progress. The live stock exhibit this year promises to be better than usual.

At the recent annual meeting of the Santa Paula Bean Growers' Association W. H. Fleet was elected president, A. F. Waldon, secretary-treasurer.

At the recent meeting of the Fullerton farm bureau center, Manager Fleet of the Rancho Sespe described his method of pruning lemons in Ventura County.

Manager Thorpe of the California Walnut Growers' Association says that California will supply the United States with the greatest crop of walnuts ever known in the history of the industry.

The five sugar factories of Orange County will be a month late in starting this year. They will not start before the middle of August. The acreage planted to sugar beets in this county this year is 75 per cent of the usual.

Claremont Pomological Club recently held its last meeting for the season at Ganesha Park, Pomona. Addresses were made by Profs. Quayle, Lipman and Webber of the state university.

The Coast and General

Oregon had 54,741 motor vehicles registered June 1.

Arizona has 92,000 acres planted to cotton as against 46,000 last year.

Farmers of Lewis County, Washington, will hold their annual picnic July 27.

Washington reports nearly all fruits three weeks earlier than usual this year.

The Salt River Valley of Arizona last year produced 14,000 bales of long staple cotton.

Pendleton, Oregon, has a flour mill devoted to the manufacture of flour from wheat substitutes.

Apple growers of the Northwest are protesting against the proposed percentage freight rate advance.

Five new refrigerating plants will be constructed in France to freeze beef for our soldiers.

Plantings of potatoes on the Yakima irrigation district are less than last year.

The early June submarine campaign on the Atlantic Coast resulted in the sinking of 15,841 tons of sugar.

Canadian candy manufacture is limited to half the monthly average of last year.

Italy is harvesting her cereals, the acreage of which is practically equal to pre-war acreage.

Canneries at Yakima, Washington, are now at work on cherries. Beets and string beans come next, then pears.

Aphis has done serious damage to vegetable crops in Northern Washington. Peas, beans, and cabbage are affected most seriously.

Virginia apple growers are seriously embarrassed by scarcity of containers. Barrels, crates, baskets, and hampers are all lacking in quantity.

The Southwest Washington fair will be held on the fair grounds between Chehalis and Centralia, August 26-30.

The United States exported to the Allies in ten months ending April 30, 100 million bushels of oats and oatmeal and 39 million bushels of corn or corn meal.

Hawaiian agriculture, especially sugar production, has been hit hard through loss of its trained or specialized labor which has been drafted in the war.

The horticultural commission of Yakima County, Washington, is making a fruit tree census. Apples are the leaders, with well over 2,000,000 trees.

The department of agriculture of the Philippines has finished a very successful corn drive among the farmers of the islands. Effort is being made to secure the largest possible plantings to corn this year.

Berry growers of Whatcom County, Washington, are short of pickers as they say Canadian growers are offering better prices. This they are able to do as they are receiving five cents more per pound for their fruit.

Idaho preceded its threshing season by holding a series of threshermen's schools. These were conducted by the food administration and authorities of the state university. It is estimated that in some districts as high as ten per cent loss of wheat is incurred through careless or inefficient operation.

How to Determine When Trees Need Irrigation

By Robert W. Hodgson

IRRIGATION is of paramount interest to every citrus grower. The two most important factors in determining the location of a citrus producing area in Southern California are the frost hazard and the supply and cost of water. Of these two it is impossible to say which is the more important. However, it is possible, though not always profitable, to grow citrus fruits where there is danger from frosts, by means of orchard heating, whereas it is not possible to grow citrus fruits commercially without an adequate water supply for irrigation purposes. Citrus trees are evergreens and do not pass the winter in a dormant condition but continue to grow and transpire water vapor all the year round. In addition they are of tropical origin and not provided with adaptations conducive to the most economical use of water. They must therefore be supplied at all seasons of the year with a sufficiency of water to maintain the tree in a healthy condition.

In many sections the water supply is limited, and in order to use it economically and to its limit irrigation calendars or schedules have been devised whereby each orchard is irrigated at a set period varying from three to six weeks, which period is presumed to represent what is considered the average time elapsing following an irrigation before the trees again need water. This arbitrary arrangement of course cannot take into consideration the fact that the need of the trees for water is determined largely by climatic conditions. This is particularly true of citrus trees by virtue of the fact that they possess little or no control over their water loss, which is of course directly proportional to the intensity of weather conditions. The great variation in climatic conditions which may normally be expected during the summer and fall with the resultant variation in water loss from the trees makes irrigation at set periods unsatisfactory. Thus the soil moisture may be depleted in three weeks at one time of the season and not before five weeks at another. In case the irrigation period is four weeks the trees suffer at one time and could go for an additional week at another time. In view of the importance of keeping soil moisture conditions optimum, especially during the critical period, irrigation at set periods cannot be thoroughly satisfactory. It savors of the rule of thumb methods of years gone by. It may not be possible in every case to get away from this practice, but whenever it can be done water should be given the trees only when they need it, whether it be three weeks or five weeks following the last application.

This matter of scientific irrigation has been brought to the attention of citrus growers by a number of investigators in the last year or two, but the average orchardist does not as yet thoroughly understand how to put it into practical operation even where he has control of his water supply. Moreover, the terms used and the relations between certain constants are not clear to many growers, and the present article is written in the hope that it may clear up some of these misunderstandings.

What Water Is Used by the Tree

Water may exist in the soil in three forms, hygroscopic, capillary and free or gravitational. When a soil is air dried it still contains some water in the form of very thin films about the soil particles. This water is not available for use by plants to any extent and is known as hygroscopic water. When a soil is saturated with water and placed in a position where it can drain a certain amount of water drains off. This is free water and is not ordinarily available for plant use. After draining the soil still contains a certain amount of water which is lost on air drying. This portion represents the moisture available to the tree and is known as capillary water. It exists as films surrounding the soil particles and with the hygroscopic moisture constitutes the water holding capacity of the soil.

Irrigating Young Orange Grove
Nearly all citrus sections irrigated by the furrow method.

The water holding capacity of a soil depends largely upon the size of the soil particles, as well as somewhat upon their arrangements and the amount of humus in the soil and averages about as follows: Ordinary sand, 20-30 per cent; sandy loam, 30-40 per cent; clay loam, 40-60 per cent; heavy clay, 60-70 per cent; very rich garden soil, 70-90 per cent.

However, most plants, including citrus trees, grow best when the soil does not contain all of the capillary water it is possible for it to hold. Such plants require considerable air in the soil for their best development. The per cent of moisture at which the plant does best is known as the optimum moisture content and it usually lies between 50 and 60 per cent of the water holding capacity.

Moisture Equivalent

Soil physicists have felt the need of a constant by which they could compare different soils as to their water holding capacity. The moisture equivalent represents the per cent of moisture left in a soil after it has been whirled in a centrifuge and subjected to a centrifugal force of 1000 times gravity. It is merely an arbitrary standard for soil comparison, but the important thing is that a number of investigators have shown that the moisture equivalent of any soil lies very near the optimum moisture content, and therefore the moisture equivalent offers an easy method of determining the optimum moisture content. Lipman and Fowler working on the optimum moisture content for lemon trees have recently confirmed this finding. The moisture equivalent varies according to the size of the soil particles and organic matter content as shown in the following: Coarse sand, 4.6; fine sandy loam, 6.8; loam, 18.9; silt loam, 24.4; clay, 38.2.

Wilting Per Cent

As stated before, of all the water the soil can hold, excluding free water, not all is available for plant use. Most of the capillary water can be used by the plant, but below a certain per cent the plant cannot draw on the soil water. This per cent at which wilting occurs is known as the wilting per cent and it represents the hygroscopic water and in some cases a slight amount of capillary water. As is true with the moisture holding capacity and the moisture equivalent the wilting per cent varies with the size of the soil particles and humus content, averaging about as follows: Sand, 2.2 per cent; sandy loam, 2.5 per cent; loam, 5.0 per cent; clay loam, 6.5 per cent; clay, 10.5 per cent.

That portion of the soil moisture lying between the optimum water content and the wilting point is available to the plant, and what the irrigator desires is to prevent the soil moisture from reaching the wilting point and to keep as near the optimum moisture content as possible.

If the moisture equivalent is known, the water holding capacity, the optimum water content and the wilting point may be obtained by the use of certain formulas which have been worked out by soil physicists. The wilting point, which is the constant we are most interested in, equals the moisture equivalent divided by 1.84.

Depth of Irrigation for Citrus Trees

The first question to be decided is how deep should the soil in a citrus orchard be wet. This obviously depends upon the distribution of the feeding roots as it is manifestly wasteful to put costly irrigation water beyond the reach of absorption by the tree. Dr. J. Eliot Coit and the writer several years ago made a study of the root distribution of orange trees under average clean cultivation practices in a deep soil where no such obstacles as hardpan, which might prevent deep rooting, were present. We found between 70 and 80 per cent of the absorbing and feeding roots in the upper 30 inches. Jensen has recently found that citrus trees absorb no appreciable amount of water from the soil below four feet. We may then feel reasonably certain that if the soil is wet to a distance of five feet down, and kept wet to that depth, our trees will have a sufficiency of water.

How to Determine Optimum Moisture Content

The next question to decide is what is the optimum moisture content for my soil. This can be gotten at in a number of ways. A perforated can containing a known weight of dry soil can be saturated with water and then allowed to drain for several days protected from evaporation, and the water loss determined. This can be expressed in terms of dry soil, giving the water holding capacity. To get the optimum moisture content take 60 per cent of this. As pointed out above, the optimum moisture content and the moisture equivalent are practically the same, and the moisture equivalent may be obtained by the use of a centrifuge. The division of soil technology of the College of Agriculture at Berkeley has several of these machines, and Prof. C. F. Shaw, head of the division, when consulted by the writer on this subject, replied as follows:

"We will be very glad indeed to make moisture equivalent determinations up to the limit of our ability considering our available laboratory force. The sample for moisture equivalent determination should preferably consist of a quart of soil, taken as a composite sample representing the average soil from the surface to a depth of four or five feet. We can, in addition, calculate from the standard formulas at present available the total water holding capacity and the wilting point and can report these critical points to orchardists."

Once these constants are known to an orchardist all that is necessary is to take soil samples at intervals, determine the moisture content and, if it is approaching the wilting point, irrigate. If not, irrigation is not necessary. The moisture content is determined by weighing a quantity of the soil, thoroughly drying it, and dividing the loss multiplied by 100 by the dry weight of the soil.

Free Publications on Preserving Food

University of California

The university has published a number of bulletins, circulars and leaflets on food preservation. Copies of those still available will be found in the list given below. They will be sent free of charge on application to College of Agriculture, Berkeley.

Circular 146, "Jellies and Marmalades from Citrus Fruits."

Circular 158, "Home and Farm Canning."

Methods of Food Preservation I: "Canning Fruits and Vegetables."

Methods of Food Preservation II: "Fruit Juices and Jellies."

Methods of Food Preservation III: "Drying Fruits and Vegetables."

Methods of Food Preservation IV: "Candying Fruit, Making Fruit Vinegar, and Salting Vegetables."

"Home-Made Vinegar."

"Sterilization of Meats in Jars."

"Tomato Paste."

"Home Pickling of Ripe Olives."

Bulletin 287, "Vinegar from Waste Fruits."

U. S. Department of Agriculture Farmers' Bulletins

The following Farmers' Bulletins, with the exception of No. 183, may be obtained free of charge by writing United States Department of Agriculture, Washington, D. C.:

Farmers' Bulletins 839 and 853, Home Canning.

Farmers' Bulletin 841, Home Drying of Fruits and Vegetables.

Farmers' Bulletins 903 and 916, Commercial Drying of Fruits.

Farmers' Bulletins 183 and 913, Preservation of Meat (Smoking and Salting).

Farmers' Bulletin 203, Jellies.

Farmers' Bulletin 881, Preservation of Vegetables by Salting and Fermentation.

Citrus Canker Eradication

FOR more than three years the federal government and the Gulf States have been engaged in a joint campaign for the eradication from the United States of the disease of citrus fruit and trees called citrus canker. This undertaking is unique in character in that it is the first instance of the use of federal funds appropriated specifically for the eradication of a plant disease. It is of overwhelming importance to the citrus industry, because citrus canker has been recognized as the most contagious of all known plant diseases and the most destructive of commercial values.

When the disease was first recognized as a new one, an immediate and rapid inspection of the Gulf region by an agent of the federal horticultural board of the United States department of agriculture, supplemented by reports from state officials, indicated the occurrence of infected citrus trees in more or less widely separated and sharply defined localities from southeastern Florida to southern Texas.

Extremely Infectious

In outlining plans for the eradication of citrus canker emphasis has been placed upon the magnitude of the undertaking because of the extreme infectiousness of the disease and the wide area throughout which it has been disseminated. Owners of citrus groves were advised that whenever symptoms indicating this disease appeared they should take all possible precautions to avoid its spread, prohibit all visiting to the grove affected or those adjacent, stop all cultivating or other work, and send for a state specialist to determine definitely the disease.

Whenever a tree was found to be actually infected with citrus canker the course advocated was to burn it at once. Although this treatment is extremely severe it is the only one which has been found practicable and effective in checking the spread of the disease. This method of eradication, first used in Florida in the autumn of 1914, has been adopted throughout the entire region where citrus canker has been found, and additional safeguards not at first recognized as necessary were later employed.

The cooperative work of inspecting citrus groves and nurseries and destroying infected trees was begun in Florida immediately upon the approval of the urgent deficiency act of January 25, 1915, and shortly afterwards cooperative agreements for similar work were made with Alabama, Texas, Louisiana, Mississippi, Georgia and South Carolina.

Inspectors Disinfect Clothing

Inspectors for citrus canker were required to wear suits similar to the overalls worn by thrashing crews or garage mechanics, completely covering their usual clothes, also leggins and canvas hats, all to be completely and thoroughly disinfected in a 1 to 1000 solution of bichlorid of mercury before entering citrus properties and upon leaving them. At the same time inspectors were required to disinfect thoroughly their shoes, hands, and faces, and instructed to avoid touching any citrus trees when inspecting them, though if it became necessary to move a limb in order to thoroughly inspect a tree, this could be done with special precautions to avoid as far as possible the chances of spreading contagion from diseased spots not then visible to the naked eye. All apparatus taken into citrus groves, such as oil cans and special pumps for spraying oil or formalin, etc., had to be thoroughly sprayed with disinfectants before being taken from the orchard. Upon finding infected trees, the ground under the tree was sprayed thoroughly with a five per cent solution of formalin and, especially in properties where grove trees were of considerable size, the spraying with a one per cent formalin solution of all apparently healthy trees adjacent to infected trees which were to be destroyed was advised.

While these precautions are more extreme than have been found necessary in fighting any other plant disease, they are necessary on account of the extreme infectiousness or contagiousness of citrus canker; and partly because of this the success of the campaign for the eradication of citrus canker may be said to have established a new era in preventing and control work in dealing with plant diseases.

No Infected Trees in Florida

Throughout the extensive citrus developments in Florida no infected trees have been found for several months past, but since it is unlikely that all traces of the disease have been discovered and eradicated, it would be unwise to relax the rigid campaign of inspection until another growing season has passed.

In the other states concerned the work is somewhat complicated by the rather general practice of mixed plantings of susceptible and somewhat resistant types of citrus trees. In South Carolina, however, it has progressed so satisfactorily that it is unlikely that further work will be required during the coming year, while in Alabama, Texas, Louisiana, Mississippi, and Georgia a longer time will undoubtedly be necessary.

Citrus Canker and Australia

State Horticultural Commissioner Hecke gives warning to citrus shippers to use greatest care regarding shipments to Australia. The Cultivator has referred to the fact that Australians are very desirous of keeping out citrus canker and citrus canker is existent in the United States. The press of Australia has been loud and insistent in its calls for a quarantine against all citrus from the United States, including California. In order to forestall any possible attempt to repeal the proviso of 1916, which exempted California and Arizona citrus products from the general quarantine orders affecting this crop, Mr. Hecke addressed the department of agriculture of Australia on the subject, going into considerable detail in regard to canker and its status in California and Arizona and offering to furnish guarantees that there was no danger to be anticipated in allowing the importation of citrus fruits from the above mentioned states. Apparently this effort has borne fruit, as the state office is in receipt of a recent communication from the department of agriculture of Australia, stating that in the case of California and Arizona Australia will adhere to the proviso of 1916 and continue to allow the entry of citrus fruits subject to the following conditions, which are herewith quoted:

"Citrus fruits may be imported from the states of California and Arizona subject to the condition that each consignment be accompanied by an official certificate dated and signed by a responsible officer of the government, giving the name of the country of origin, name of state in which it was grown, identifying fruit and stating the quantity and certifying that the fruit was grown in the state specified, that citrus canker does not exist in said state, that the consignment is free from canker and all other diseases."

Pear Growing in California

"Pear growing in California dates back over a period of approximately one hundred and fifty years, although commercially the industry amounted to little until more than a century later. The first trees were planted by the Franciscan Fathers on the grounds of their various missions, including Mission San Jose in the Santa Clara Valley. Strange to say, this valley which witnessed the beginning of the pear industry in the state has, up to the present time, been absolutely free from blight, the scourge of the pear orchard, which has spread throughout practically all other pear-growing sections in the United States and which has made the growing of this fruit unprofitable, if not impossible, without the application of extreme measures in its control. There are some very large seedling pear trees at Gaviota, Santa Barbara County, California, which are said to be at least 125 years old. The largest tree is about three feet in diameter and at least 45 feet high. They are very thrifty and except at close range look like oaks. Apparently blight has never affected them in the least. At San Rafael there are some old seedling trees which are said to have been planted in 1817. These are also hardy and free from blight.

"Since the days when the Padres demonstrated the adaptability of the pear and other fruits to California conditions, on the lands surrounding the missions, many of which are still standing amidst remnants of these old tree plantings, the pear industry has assumed such proportions that it is now one of the leading deciduous fruit industries of California. During the year 1916, according to the best available figures, there were 17,764 acres of pear trees in bearing and 23,325 acres that had not yet come into bearing in the state. In 1917 the bearing area was increased to 20,473 acres and the nonbearing to 28,069 acres. During 1917 there were shipped from the state 4798 carloads of pears. In addition there were dried in Lake County alone the equivalent of 3981 tons green fruit. The total production of shipping, drying and canning pears was approximately 90,000 tons."

The above quotation is from "Pear Growing in California" given in the Monthly Bulletin of the state commission of horticulture. That publication, by the way, has the most complete fund of information regarding the pear in California yet issued. It is written by Geo. P. Weldon, chief deputy commissioner of horticulture. It is largely illustrated, striking color plates being features.

Bean Growers' Annual

AT THE annual meeting of the California Lima Bean Growers' Association held in Oxnard last week, the following directors were elected: W. S. Saviers, Oxnard; B. F. Barr, Hueneme; C. C. Perkins, Camarillo; William Culbert, Somis; A. C. Vickers, El Rio; Roger G. Edwards, Saticoy; John Lagomarsino, Ventura; E. E. Stowe, Goleta; Alexander Jeffrey, Owensmouth; R. L. Owens, Van Nuys; W. C. Jerome, Santa Ana; G. W. Moore, Smeltzer; E. H. Jones, San Diego County; Edward Chaffee, Garden Grove. These directors have elected for officers: C. C. Perkins, president; Roger G. Edwards, vice-president; W. H. Stiles, secretary; W. S. Saviers, treasurer; R. L. Churchill, manager.

Final figures of the secretary and manager show that the members of the association have netted around $11 per hundred pounds. The expense of handling marketing operations was not far from 18 cents per hundred, or about 1.5 per cent of the selling value of the beans. The association membership has increased 130 per cent over that of 1916. The saving to the members in purchase of twine and bags was in excess of $30,000—this because of cooperation and early buying. From Manager Churchill's annual report we note regarding the difficulties confronting the producers that the bean market the past year has been affected by a number of extraordinary conditions for which the war was chiefly responsible, such as:

Five hundred per cent increase in the production of pinto beans in Colorado, New Mexico and western Nebraska.

Serious frost and rain damage to Michigan and New York bean crops, seriously decreasing their normal output of beans.

Vast increase in California bean production of varieties other than limas.

Heavy contracting in the spring of 1917 between growers and dealers and dealers and jobbers, when confronted with United States Food Administration regulations in the fall, very greatly stimulated speculation and the selling and re-selling of contracts between the holders of carload contracts, in the period from September 1 to November 1, and caused a great variation to continuously prevail upon all markets subsequent to November 1.

Congestion of railway lines and serious delay in delivery of cars caused about two months of the best buying and consuming period to be partially lost, and this condition combined with the effect of the enforced purchase and use by housewives of immense quantities of cereal substitutes for wheat flour resulted early in the spring in an unusually light consumptive demand for canned goods, dried fruits and beans.

The removal by ruling of the Food Administration of the speculative profits took with it the chief incentive on the part of many dealers for the handling of beans, and when, in addition, some of them were faced with loss due to declining market prices, they not only refused to be interested in purchasing more beans but were not very active in pushing the sale of stocks of beans they had on hand.

Mr. Churchill closes his report with a plea for loyalty to the association on the part of members and a plea to those who are on the outside to support their own industry by becoming members of the association. He said: "Each member of our association has his personal influence and his personal friends. If each will let it be known that he not only believes in the association but thinks that all bean growers should be contributing and sharing partners in it, such action would undoubtedly furnish just the boost necessary to push our association into the position where we should all like to see it placed."

The family tree is judged by its fruit.—Binghampton Press.

A GOOD WORD FROM ALPINE

If I were to compliment you on every good piece in the Cultivator I would be compelled to write a letter every week, but I cannot refrain from mentioning the excellent article on page 12 of the July 6 issue, nevertheless (Pig Feeding Contest in Glenn County, by Adviser Heileman). There is much in the experience of the boys that the average farmer might well consider and profit by.

Very few farmers in this country will hesitate in saying that the present prices of feeds are too high to allow a profit in raising hogs, yet these boys have demonstrated beyond a doubt that there is no reason why anyone should have refused to have raised a hog or two in the recent campaign. While I am not in the business myself, I did raise 24 this last spring at a good profit; and have 15 more about ready to go into the feeding pen.

The feed was all bought and hauled in by truck, that was not raised on the ranch (which was charged at market prices), and the results were very satisfactory, leaving a very large doubt in one's mind whether the average farmer keeps detailed accounts enough to enable him to know whether he is doing business at a loss or not.

Hoping you will have other articles of a similar character later, I remain. —D. H. Ogden.

WHITE FLY FROM OHIO

The following from the state horticultural commission furnishes an excellent example of the possibilities of receiving new and dangerous pests from unexpected sources through the agency of the parcels post. There was recently intercepted by the quarantine guardian at San Jose a package containing a small lemon tree. This plant was heavily infested with the citrus white fly, Dialeurodes citri, and also with certain unidentified leaf rollers. The plant in question came from McGregor Brothers Company, Springfield, Ohio. Coming as it did from a point so far north of the citrus belt as Springfield, Ohio, we would not be led to expect this species, neither would we look for citrus trees in this quarter. The secretary of agriculture of Ohio has been asked to investigate the matter, as there is a possibility that the plant came from some point further south and was reshipped from Springfield.

ENTOMOLOGIST IN CALIFORNIA

Dr. L. O. Howard, chief of the bureau of entomology, United States department of agriculture, is making a tour of California. In company with H. S. Smith, superintendent of the state insectary, he is now in the southern part of the state, where he will confer with the different members of his staff relative to entomological activities of his bureau in this state. He will also have an apportunity to see the work being done by California in insect control through biological methods.

TEAGUE QUALITY

CITRUS TREES

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

Home Preparation of Fruit Syrups and Preserves

By W. V. Cruess

SYRUPS made from grapes, apples, and other fruits, can be used in cooking or on the table to replace sugar to a great extent. We give below methods of making which have proven successful.

Fruit Syrups for Table Use

Clarify the fruit juice. To do this heat to boiling and filter through a jelly bag till clear.

Divide into two lots representing one-fourth and three-fourths of the juice, respectively.

To three-fourths of the juice add two ounces (three level tablespoons) of precipitated chalk per gallon. Heat to boiling and allow to stand over night. Filter through a jelly bag to remove the chalk.

To the filtered juice add the one-fourth of the untreated juice. Boil the juice down to a syrup and seal boiling hot in bottles or jars. This syrup is low in acid and is suitable for use on griddle cakes, making gingerbread, etc.

Precipitated chalk can be bought from any drug store. If chalk is not used, the syrup will be very sour.

Preserves

Soft Fruits: Such as very ripe apricots, plums, raspberries, and very ripe peaches may be made into preserves satisfactorily by adding an equal weight of sugar, a little water to prevent scorching and by boiling down to the desired appearance and consistency. The preserves should be packed boiling hot and sealed at once to prevent fermentation or molding.

Firm Fruits: Such as pears, firm peaches, quinces, or watermelon rind, should first be cooked in a little water until tender. Sugar equal in weight to the fruit used is then added and the whole boiled down to a preserve. Firm fruits become tough and shrivelled if the sugar is added before they have been well cooked in water or a dilute syrup.

The desired effect can also be obtained by mixing the necessary amount of sugar with three parts of water, placing this on the fruit and cooking down slowly to a preserve, or test the boiling syrup as directed in "Hyrometer and Thermometer Tests."

Fig Preserves

Choose figs, preferably of some white variety and not over ripe. Puncture them with a silver fork thoroughly so that syrup will penetrate easily.

Place the figs in a kettle: Add one pound of sugar and two pints of water to each pound of figs.

Cook down very slowly until the figs have become a heavy preserve. Pack boiling hot in scalded jars and seal.

Strawberry Preserves

Weigh the berries and add one pound of sugar to each pound of berries.

Heat quickly to boiling and boil two minutes, not longer.

Pour into a shallow tray or baking pan and set in the sun until the liquid evaporates to a thick syrup and the berries have become plump. It will usually be necessary to cover the pan with a cheesecloth during the exposure to the sun to exclude flies. About a week's time will usually be necessary for the syrup to concentrate.

When they have reached the desired point, pack in jars or glasses and seal with paraffine.

Strawberries preserved in this way are much more attractive in texture, color, and flavor than those prepared in the usual household way.

Fruit Preserves or Butters without the Use of Sugar

Peel and pit the fruit. Add enough juice to prevent scorching. Cook till soft. Pass through a fine screen.

To the pulp add three quarts of apple or grape juice per quart of pulp and to each four quarts of the mixture, two teaspoons of ground cinnamon and one of ground cloves.

Or, if apple or grape syrup prepared as directed in recipe 1 is available, add one quart of syrup to one quart of pulp instead of using the juice as noted above.

Boil down to a thick buttery consistency. Seal boiling hot in jars or cans. This preserve will be very tart and will be suitable for a relish.

Hydrometer and Thermometer Tests

A syrup or preserve is done when it boils at 221 degrees Fahrenheit or tests when hot 61 degrees Balling or 34 degrees Baume. (See Circular 146 University of California, Berkeley.)

Gladiolus Growing in Southern California

NO FLOWER gives such whole souled and immediate satisfaction as the gladiolus. It blooms for almost 12 months in the year, is of exquisite beauty and is very prolific. Dr. C. H. Castle gives the following directions for its culture in The Flower Grower:

The culture of the gladiolus during a season is something like this; the field of course being dry is irrigated in the fall by flooding, say in the months of October or November. There may be rain but we do not depend on it. The ground is plowed as deep as possible with teams at least ten inches, cross plowed and harrowed twice each way. Then the furrows for the bulbs are laid off, 18 inches for hand cultivation and two feet apart for horse cultivation.

These furrows are made by the use of a small plow once each way in the row, throwing the dirt out on both sides. This leaves a ditch rather square on the sides, the width depending on the size of the plow used. Water is then run in the ditches to moisten the subsoil. The bulbs are planted any time thereafter, but I have secured better results from the plantings made from the 15th of December to the 1st of February. I use the same method for bulbs of all sizes only planting fewer across the row as the sizes grow larger. I have never planted single rows but as many as four flowering bulbs across the ditch at about twice the width of the bulb apart. Bulblets are planted broadcast in the ditches and covered the same as the bulbs.

The bulbs are covered by hand labor using the ridge on one side to cover the row next to it. I then apply a top dressing of fresh dairy or chicken fertilizer and leave the field till the sprouts show above the

Reduce Friction

Friction wastes distillate, oil, steel and time. Reduce friction and save the power. That's the aim of the engineers who build the Yuba Ball Tread Tractor. The secret is in the Balls on which the machine glides—glides so smoothly and easily. *Study the* Ball Tread.

ground. When the stalks are about six inches high, and have two or three leaves, furrows are run between the rows about four inches deep and the dirt thrown up around the plants. This ditch is then filled with fresh fertilizer and watered by sprinkling. This is done every two weeks if there is no rain and is followed by cultivation. When the first buds are formed another layer of fertilizer is applied and watered thoroughly. This is the last food the bulbs are given and after the last cuttings have been made the field is allowed to dry off and when the bulbs are dug they are already cured and will stand shipment or storage.

In growing gladioli I have no use for well rotted or leached out manure except that it has been rotted into the field and I cannot see that the character of the soil or the chemical elements of it in the top four inches, that is the part above the bulb, is going to be of any use to a bulb that sends all its roots downward. (Because of bottom irrigation). The top soil to me is only a mulch to conserve the moisture and the fertilizer I put on the field each year furnishes the humus for the following year, while the liquid elements of the fertilizer are washed down to the roots where needed. I also use this method in the home garden, digging the ditches the width of a spade with distance enough between the rows to allow for cutting the blooms.

There is a great deal of satisfaction in being able to control absolutely the water, giving as needed and withholding if the plants seem to have plenty. At digging time there is no question as to whether your bulbs will dry as wished or not as you have control of these conditions. The tops are twisted off (better cut off), and the bulblets removed at the time the bulbs are dug, the bulbs are stored in crates two feet wide and three feet long and three inches in depth. These are made of slats with cracks wide enough to premit of the circulation of air through them.

The plants at this writing (March 0) are about a foot high and have had their first layer of fertilizer in the ditches as well as the top dressing applied in January. I expect to make the first cuttings of blooms about the first to tenth of May with the bulk of the cutting coming about Decoration Day. Of course there will be flowers before the above mentioned date but by commercial cutting I mean 500 flowers or more per day.

This is the natural time for the flowers that come from bulbs raised in this country and I am unable to see why under intensive cultivation as used in forcing these bulbs will not do better than bulbs whose natural blooming time is later. I note discussion regarding bulbs deteriorating with age and would say, that in my experience that the older the corm the more prone to suffer from disease. Undoubtedly they do lose in vitality in this country after the fourth year, becoming flatter and thinner and my best flowers are raised from the third year bulbs.

I also find that about 20 per cent of the bulblets will bloom marketable flowers the first year from most of the common varieties. The bulbs from bulblets grade about 20 per cent first size, 30 per cent second, and the balance third and fourth sizes. Formerly I grew about 100 varieties but last year put into the mixed bulbs all but the varieties which I shall grow, hybridizing from them and adding as the newer ones find favor. I have a number of seedlings that date back ten years and over and am adding to the collection each year. This is the most interesting work connected with the growing of the gladiolus as the crossing and record keeping is very simple and can be done by any amateur in his own garden and results may be had equal to any if care in the choice of varieties for the parents are used. The amateur is more apt to be careful and make "pets" of the flowers than the professional and that all adds to the results. There is a satisfaction in growing something new and original in one's own garden. I am unable to see the advantage of flowers five to eight feet in height as that condition generally necessitates staking and to date I have never had to use stakes either in the field or home garden. I might also add that a chart of the planting is always made with the date of planting, the origin of the stock, the age of the bulbs and any other data that might be of use. Later the number of flowers cut is added to the record of the bed.

In following up the bulbs that I have sold I find that the gladiolus is surely resistant to neglect, will grow and flower in most any kind of soil, from the mountains to the sea, and in all is about the easiest to grow and the most satisfactory flower in the garden. It is possible out here to have flowers from gladioli nearly every month of the year, one of the growers here cutting over 10,000 for the Christmas holiday trade. In the home garden the bulbs consist mostly of seedlings but in the field the varieties are as follows: America, Mrs. Francis King, Augusta, Peace, Sulphur Queen, Golden King, Halley, War, Mrs. Frank Pendleton, Mrs. Watt, Ida Van, Schwaben, Rouge Torch and Liebesfeuer. These have all been tested over several years growth and newer varieties are added and tested each year. There are many others in the mixed varieties including the ones above but the ones named are the most satisfactory to me and to the trade.

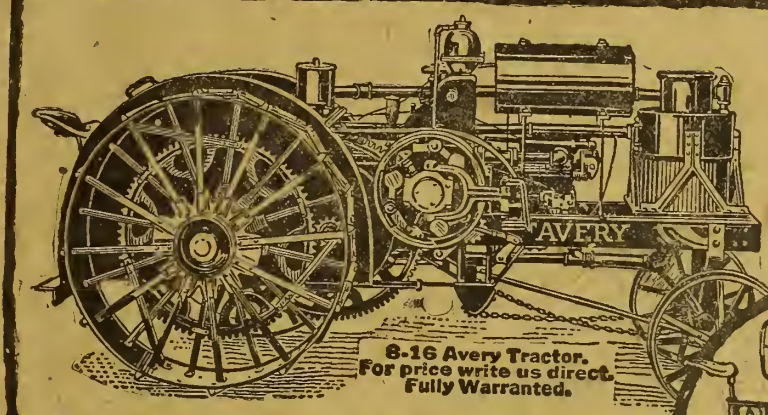
There is no doubt now that American grown bulbs and plants must be grown to supply the home market and I can only urge the amateur to insist on American grown bulbs and plants as there can be no question of their superiority over the imported stock.

Each year I learn more and more of the habits, needs of the plants and the general handling of the crop both in the garden and in the field and the work becomes more interesting. To the amateur who is growing gladioli for the first time I would say, buy named varieties, not too many kinds at first, of a reputable grower, cultivate the soil well and deep, give plenty of water and sunshine, and you will be well repaid for your money and work expended.

FOOD FOR GERMAN PRISONERS

The treatment of interned Germans in the United States is now being used by German propagandists in an effort to create unrest among the American people. The food administration, however, officially denies rumors that German prisoners are being prodigally fed on bread, pastries and cakes made entirely of wheat. The Germans interned in American detention camps while well fed, are being made to observe all rules and regulations of the food administration.

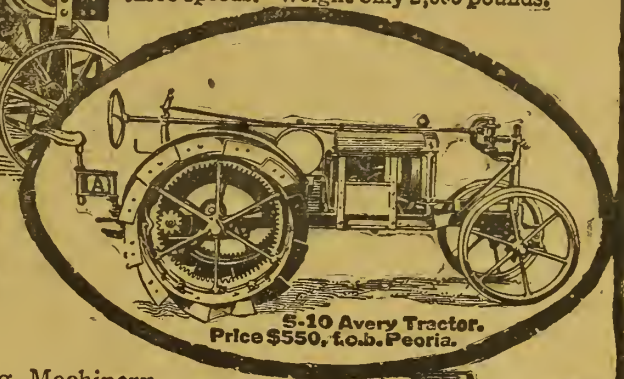
The military prisoners — prisoners of war—receive the regular garrison ration of the United States army. This is according to The Hague Convention.



8-16 Avery Tractor. For price write us direct. Fully Warranted.

The wonderful Avery 8-16 Tractor (to the left) pulls 2 or 3 plows and drives 19-inch threshers, etc. Fully warranted. Price includes a reasonable profit to dealers **who are obligated to supply Avery Service.**

The 5-10 Model B Avery Tractor (below) is **just the tractor for small farming, fifty acres or less.** Just the thing for truck gardening, fruit growing, etc. Gear driven selective type, three speeds. Weight only 2,000 pounds.



5-10 Avery Tractor. Price $550, f.o.b. Peoria.

Avery Gives the World Power for Every Farm Need

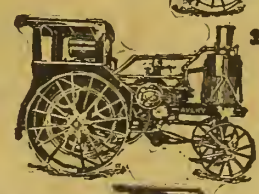
—For Every Size Farm and Every Kind of Work

THE complete line of Avery Motor Farming Machinery fills all power farming requirements for every size farm in the world. The Avery is the **one standardized, thoroughly proved complete line of motor farming machinery.**

With one of the sizes of Avery Tractors, you can plow, prepare your seed bed, and plant **and harvest your grain crop.** With an Avery Motor Cultivator you can cultivate your corn, cotton, beans or any crop planted in rows. With one of the eight sizes of Avery "Grain-Saving" Separators, you can thresh all kinds of grain, kaffir corn, clover and other seeds. Every size Avery is a one-man outfit. For any kind of field work, belt work, or road work there is an Avery motor power machine that can be used safely, successfully and profitably.

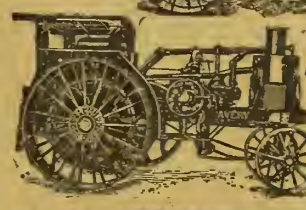
Avery Tractors are entirely built in our own big factories and every part of an Avery Tractor (motor, radiator, transmission, etc.) is built **especially** for tractor work and **only** for the Avery Tractor. The Avery Company are builders—not assemblers. They specialize in motor farming machinery. Don't confuse the Avery Tractor and other Avery machinery with the ordinary assembled machine.

12-25 H.P. Avery Tractor For 3 or 4 plows and 22 in. Threshers



18-36 H.P. Avery Tractor For 4 or 5 plows and 26 or 28 in. Threshers

25-50 H.P. Avery Tractor For 5 or 6 plows and 32 inch Threshers



40-80 H.P. Avery Tractor for 8 or 10 plows and 36 or 42 inch Threshers

Some Special Avery Features

With the Avery Tractor you can unhitch from one machine and instantaneously hitch to another at the drawbar, or apply belt power. And you don't have to use a wrench to do either—the coupler is automatic and the belt pulley is always in place.

Avery Tractors are the only make with a Duplex Gasifier. It does the trick—turns kerosene or distillate into gas.

The Avery motor is low speed. Main bearings are adjustable from the outside. Patented inner cylinder walls are removable. All parts are accessible and every part renewable. With the three or four-plow Avery Tractor and an Avery Motor Cultivator, one man can prepare and cultivate two and one-half times the acreage of corn that can be raised with horses.

See the Nearest Avery Dealer

Go to the Avery dealer and select and buy the size tractor and equipment to meet your requirements (no matter how small or how large the acreage you cultivate) or write direct for complete Motor Farming Catalog.

Where the Money for Farm Loans Comes From

I NEED a government loan to clear land so as to enable me to produce the food the government asks me to grow."

"If we have to give security for government money, what good does the federal farm loan act do me?"

"I thought the government would lend me money without all the old bother of examining titles and making me put up two dollars in security for every dollar loaned me. This is nothing but the old, old story."

"Why be so particular about the security for the government's money when what we need is food to win the war? Let us have the money. Money invested in the war is never lost if the war is won."

Have you heard such things as the above uttered when the federal farm loan act is under discussion? If you haven't you live in a neighborhood the people of which understand the facts. If you have you live where the federal farm loan act is misunderstood.

Not "Government Money" at All

In the first place, the money loaned to you through your national farm loan association is not "government money" at all. It is money borrowed from people who have it to be loaned to you. It is a trust fund. It is not "the old, old story," for it is loaned on easy terms and on very long time, but it must be secured just as completely as money borrowed from anyone else. It is not easy money. It is not easy to get, for the borrower must give ample security. It is easy to repay, because it is loaned for a generation or more of time, and is paid up in small regular installments —but it is not easy money in the sense that it can be had for the asking.

Even if it were "government money" it would be unfair if it were paid out to farmers without security. Government money belongs to all the taxpayers; and to lend it without good security to some taxpayers would be robbing Peter to pay Paul. But federal farm loan money is not government money at all. It is the money of people who lend it to the federal land banks. Why do they lend it? Because they want to help the farmers? Sometimes, and partly, perhaps, but every dollar loaned by these people to the land banks is loaned on a solemn promise that it will be paid back and as a sacred trust.

"Here is our money," say the investors; "take and loan it to the farmers; but we lend it to you only on your solemn promise that you will pay us our interest when it is due, and that the principal will be paid when it is due."

"We take the money," is the promise of the federal land bank, "and we solemnly promise on behalf of ourselves and the farmers to whom we loan it that the interest will be promptly paid and the principal when due."

The federal land banks belong, except for money temporarily invested in them by the government, to the borrowers. Therefore the promise of the banks is the promise of the borrowers. Every borrower has promised that the money invested by those who buy federal farm loan bonds will be repaid, principal and interest, not only in full, but on the very day it is due. The honor of the farmers is at stake, the honor of the officials of the federal land banks is at stake, the honor of the officials of the federal farm loan bureau at Washington is at stake, and the honor of the government which has established this system for the farmers' benefit is at stake.

In order that every dollar may be paid when it is due, and absolutely in full, loans are confined to amounts not to exceed 50 per cent of the value of the land. If improvements are considered, the loans must not be made on them to an extent of more than one-fifth of their value, and they must be permanent and insured improvements. Improvements which are not insurable can not be considered, and insurable improvements must be insured.

Where the land has no agricultural value no loans can be made. Where the land is threatened with destruction by seepage, alkalifying, washing away, or the exhaustion of fertility, no loans can be made until the danger is done away with in some way. These loans run for 35 years, most of them, and loans will not be made on farms which are in danger of becoming worthless within that time.

Is this policy too strict? Not at all. It is the only policy which the farmers themselves ought to tolerate. If loans were carelessly made many farms would have to be foreclosed upon because the farmers could not pay them off. When they were taken under the mortgages they would not sell for enough to pay the mortgages. If they failed to pay the mortgages, the farmers would lose the money they have invested in the stock of their farm loan associations. If that failed to make up the losses, the farmers in the bankrupt associations would be liable to an assessment of another five per cent on their stock. If there were not enough collected thus, the capital of the banks would be drawn upon, as well as their surplus; and, finally, the federal farm loan bonds could not be paid. Long before that state of things could be reached investors would cease buying bonds, the banks would be unable to get money to loan, and the system would break down. We should revert to the old system of loans through mortgage companies for short terms only.

That is why the federal land banks are strict about security. That is why the federal farm loan system does not offer "easy money" to farmers who can not give the best of security.

And that is why every farmer who has money to invest should invest in federal farm loan bonds, which he can buy of any of the federal land banks or from the federal farm loan bureau, Washington, D. C. They pay five per cent interest. The interest is paid semiannually. They are exempt from all taxation. They offer a splendid field for the farmer who has money to invest. They can be had in small denominations—$25, $50, $100, $500, and $1000. If all the farmers who have money to invest will put it in federal farm loan bonds they can buy all the bonds of the banks.

Teach Soldiers Tractioneering

Great numbers of men from the engineering corps of the army are going over there with a fund of information in tractor making and operation. The tractor is a great factor in modern war. Hence after months of drill and study of war methods the engineers are taken in hand by tractor factories and the final practical touch is given their education.

One such class or company of men was recently graduated from the J. I. Case T. M. Co., Racine, Wisconsin.

The men of the company were enlisted from nearly every branch of the engineering or construction industry, so of course many of them have had some experience in the care and operation of motor.

The school was divided into lecture periods where instructions were given by Prof. G. B. Gunlogson of the research department and his assistants, on shop work, repair work and actual field work. Most of the men have never plowed by means of a tractor before, but they picked it up in a remarkable fashion. Each man in the company plowed every day and also with a different size tractor or style of plow.

A rather unique method of tractor repairing was resorted to. One of the instructors would "queer" a tractor, and the student was instructed to get it to running—and they always did. Taken man for man, this bunch was as gentlemanly a crowd of young soldiers as one could ask to meet. They applied themselves strictly to business, and learned a great deal about tractors in a comparatively short time.

PLENTY OF SUGAR FOR CANNING

Through the new certificate plan of sugar distribution, which restricts the amounts which can be used by manufacturers in candy and confection making, the government will be able to amply protect California's sugar supplies in order that the housewives may obtain their full requirements for canning and preserving.

This statement is made to clear up the erroneous impression that because manufacturers of the less essentials are under regulation, a sugar shortage, which would hamper preserving and canning in the homes, is in prospect. Such is not the case. The manufacturers are being restricted in order that the full requirements of sugar will be available for domestic canning and preserving.

Housewives who do not desire to purchase their stock now for taking care of the fruit during the approaching season will have no difficulty in obtaining it when it is needed. All retailers will sell sugar for canning and preserving in any amount on the order of the customer, who will guarantee to use it for that purpose.

SIX RULES FOR PREVENTION OF FIRE IN GRAIN FIELDS

1—Keep your machinery in repair, well lubricated and provided with an air clarifier and a good spark arrester. Hot boxes and hot carbon cause 30 per cent of grain fires.

2—Always have at hand on the harvester at least two good chemical fire extinguishers. They keep little fires from growing up.

3—Don't smoke in the fields. Tobacco may be satisfying, but it's hot.

4—Break up big fields by cutting hay strips at intervals while grain is green. These give you a chance to fight and confine fire to a small area.

FAIR DATES

Monterey County Agricultural, Salinas, July 30-August 3, Secretary John J. Kelly.

5—Plow several furrows around your grain field as a fire break. Your neighbor may not be as careful as you are.

6—Help organize your community and install fire fighting equipment at convenient points. Get ready now. After a fire starts it's too late.

BARLEY

Farmers' Bulletin 968, "Cultivation and Utilization of Barley," by Harry V. Harlin, is devoted exclusively to an account of barley as grown in the various barley sections of the United States; to its uses as stock feed, as pasture, etc.; and gives cultural information touching upon the placing of barley in rotations, the use of fertilizers, securing of good seed, preparation of soil, seeding, harvesting, shocking, threshing, cost of production, etc. The book opens with the statement that "Barley should be more widely grown in the northern and western states." Perhaps it should be, but barley growers in one western state are anxious to learn as to a price which may be depended upon in a year like the present.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tomato Blight

Can you tell what is the trouble with tomato plants that are well cared for and have good color, in sandy soil, fairly fertile. The leaves for two weeks or more have a tendency to fold lengthwise and the plants have a slight appearance which we call wilt. Do not see that they grow worse except that more plants become affected. Can not find any insects.—Subscriber, Redlands.

It is impossible to tell from the specimen of leaves sent what the trouble is, but from the above we believe it is a case of summer wilt, blight, or fusarium. If it is this trouble then there is no help for any of the plants for the disease has attacked the roots and no treatment can restore them. If the roots may be sent they will be submitted to experts, but presumably the inquirer will know by this time whether the trouble is this form of blight. If it is blight, then every plant which is affected should be pulled up and burned. This may possibly prevent further spreading, but probably it will not for the reason that the bacteria may have been introduced with the plants. Another year use care in securing blight free plants and plant on soil where there have been no diseased tomato plants grown for some years.

Eating Walnut Leaves

The leaves of my walnut tree are being eaten up. What can I do to prevent this?—Subscriber, Ripon.

The leaves which accompanied this inquiry showed that some leaf-eating insect was affecting them, but worse, the telltale black spots show the young growth is also affected with walnut blight. For this there is no treatment, and as the leaf eating does not indicate serious enough condition to justify expensive spraying of such large trees we do not see that any treatment can be recommended.

Bean Thrips

Am enclosing some leaves from my Kentucky Wonder beans. Can anything be done to check the spread of these insects? This is the third year they have taken all of my beans; the leaves drop off and the blossoms wither. Mexican beans planted next to the pole beans were not affected last year.—Subscriber, Oroville.

These leaves have been infested with bean thrips or other mites like the red spider, and they are easily killed, the principal trouble being the tender nature of the plant usually infested. Sulphur and tobacco decoctions are good. Use commercial lime sulphur (33 degrees Baume) 5½ gallons, water 200 gallons. To this may be added 14 fluid ounces 40 per cent nicotine sulphate. Another remedy recommended by Essig is nicotine sulphate one part to 2000 parts oil emulsion or miscible spray.

Walnuts

Do walnuts do well in San Diego County?—Subscriber, Lemon Grove.

There are some sections in San Diego County in which the walnuts will do exceptionally well. They require a deep loamy soil with water table not too near the surface. It is possible that in the interior where the heat is greater they might be sunburned.

CONTROLLING THE ALFALFA WEEVIL IN UTAH

A parasite of the alfalfa weevil brought to Utah from Italy by H. S. Smith when with the federal department of agriculture, is becoming a considerable factor in controlling this pest. Observations in the infested fields indicate that the percentage of parasitism went as high as 70 per cent of the individuals. With such valuable assistance the danger to the alfalfa industry that may be anticipated from the introduction of the weevil into California is considerably reduced.

Wetproof Steel Lined Shot Shells

A WET day is indeed a good day for ducks to the hunter who has the *right* shotshells in his pockets. Remington UMC Smokeless "Arrow" and "Nitro Club" Wetproof Shotshells do not require fair weather to keep in good condition and work *right* through the gun. They may be exposed to wet for hours but will not soak through—the water can not get in, can not swell them, soften the turned-over end or bulge the top wad. Mauling them around in the wettest coat pocket can not scuff them. Remington UMC makes them *right*.

This is something every farmer who loves duck hunting will learn with profit—it will make those idle wet days in the Fall welcome ones.

Remington UMC for Shooting Right

The result is virtually a new type of shell, embodying the most important improvement in shotshell manufacture in over a decade.

These are the first *completely* wetproof shotshells—an exclusive feature of the Remington UMC "Arrow" and "Nitro Club" brands for shooting *right*.

You just buy the same old favorite Remington UMC "Arrow" or "Nitro Club" Steel Lined Speed Shells, at the regular price, and you get the new Wetproof feature thrown in besides. A shell that is sure fire, gives top speed, best pattern and most penetration, and has in addition the wonderful quality of staying dry as dust inside and hard and smooth as glass outside even when subjected to the wettest weather conditions.

It took three years to perfect this waterproofing process. Special paper had to be produced for the shell bodies, a special formula discovered for compounding the *right* combinations of waxes and oils, new machinery developed for applying the waterproofing so as to work it *into* the shell as a part of it, positively sealing it against hours of wet, and new methods devised for giving the shell the same *right* finish as before.

In *black powder*, buy the old reliable "New Club," now Wetproof sealed at turnover and top wad.

Production Butter Fat Everything Guaranteed

King Korndyke Pontiac

(shown above)

Is getting just the sort of calves that we want in our herds, beautiful individuals, nicely marked, and a very large percentage of them are heifers.

Most everyone knows that he is a son of the great and only King of the Pontiacs, but have you stopped to consider what his sisters are doing right here in California? One of them, K. P. Tola Joe, holds the state record for a senior two year old with 27.18 pounds butter in seven days; another, K. P. Idyl Segis, has just broken the state junior four year old record with a production of 35.78 pounds butter in seven days; another, K. P. Tola, made over 34 pounds butter in seven days as a senior four year old; and K. P. Tola Joe came back as a senior three with over 32 pounds butter in seven days.

Why not put a choice young son of King Korndyke Pontiac at the head of your herd? One of his sons sold for $6500.00 at public auction showing the value that the best breeders place on this blood.

We are pricing his young sons at figures that dairymen can well afford to pay, and you will be pleased with the liberal terms we make. Visit the farm or write us now.

Below is our other great herd sire

Prince Gelsche Walker Korndyke

Individuality Breeding

Put the Best Blood in Your Herd

The cow making the highest official yearly butter record for 1917-1918, as shown by the report just issued by the Holstein-Friesian Association of America (and it is the world's official record for one year) is Aaggie Acme of Riverside 2nd. She is out of the same dam as our senior herd sire

Prince Riverside Walker

The junior three year old heifer making the highest yearly butter record for 1917-1918 as shown by the report just issued by the Holstein-Friesian Association of America, is Miss Valley Mead De Kol Walker. She is by the same sire as our senior herd sire, PRINCE RIVERSIDE WALKER. Buy your herd sire in the blood lines that are doing things TODAY and that will increase in value in the records they are bound to make in the TOMORROW.

We have just a few good bull calves by PRINCE RIVERSIDE WALKER, out of splendid dams. They move young at our prices.

Our Entire Herd is Tuberculin Tested

Tulare Holstein Farm

W. J. Higdon, Owner TULARE, CAL. H. L. Redd, Herdsman

You Can Own a Grandson of Tilly Alcartra

and breed into your herd the blood of that greatest of all long distance producers, and you can buy him at a price that you can well afford to pay even though you have only grade cows.

We have some choice young bulls sired by our herd sire

Prince Alcartra Korndyke

and out of well bred, good record dams. We price them well within their value, and have been able to please buyers from the far ends of California.

PRINCE ALCARTRA KORNDYKE is out of Tilly Alcartra and is sired by Korndyke Queen De Kol's Prince, an exceptionally good combination of breeding. His daughters are making great yearly records and his sons are bound to transmit great production of milk and butter.

The J. S. Gibson Co.

Williams California

Northern California Notes

Written for California Cultivator By W. S. Guilford

HOW much grain has been irrigated in the Sacramento Valley this season?" asked Frank Adams of the United States bureau of irrigation investigations on a recent visit.

As far as we were able to tell him the acreage is very small, but the results of this season's experience will undoubtedly cause this to be considerably increased in 1919. Captain M. T. Jones of Butte City is harvesting a field of grain now that he irrigated early in the season. He estimates that the yield is ten sacks greater than it would have been without the irrigation. The crop is yielding about 25 sacks per acre. Some of the best yields in Glenn County are on fields that were in corn last year and that were thoroughly irrigated last season. The "hold over" moisture from last year, in addition to the limited rains of last winter, provided sufficient for 18 to 30 sack crops.

Double cropping is becoming a more common practice each year. Grain crops harvested late in May or early in June are followed by corn or beans. The land is plowed and thoroughly flooded after the grain is cut, a good seed bed prepared and the second crop planted.

On the River Farms Company properties in Yolo County the grain this year on land in beans last fall (following the 1917 grain crop), showed a big increase in yield over crops on land that did not have a second crop.

It has been found advisable to cut the grain crop with binders—instead of combined harvesters because it can be cut greener and removed some days earlier. Additional harvesting cost is made up in getting the second crop planted earlier and in the additional value of the straw.

Profitless Dairy Cows

There was never a better time than now to "cash in" dairy cows that do not make a profit. Many Sacramento Valley dairymen are doing this. Cows that slow up in their milk flow four or five months after freshening and begin to take on fat will bring from $60 to $90 apiece for beef, and it is certainly good business to sell them. Feed will be scarce and high in price everywhere this winter, and if they are kept in the herd they will eat a good many dollars worth of feed and be worth less money next spring than now.

Small Flocks

The small flocks of sheep are increasing very rapidly on the small farms in Northern California. It takes some time to get used to having a flock of sheep around, and they are some bother," said one farmer recently, "but they have made more money for the investment than anything else on the place."

The Glenn County farm bureau shipped a carload of wool recently which was made up of small lots from these small flocks. I know of one flock that was started with nine head in 1917 and which now numbers 33.

A few sheep on a farm not only get plenty of feed—generally but there is great variety, and the animals should be in the pink of condition at all seasons of the year. This insures a big crop of strong, healthy lambs and a maximum weight of fleece. In range flocks where there are fat and lean periods of feed this condition is shown in the growth of the fleece.

Where cows are kept and silage fed, a few forksful of silage a day will provide splendid succulent feed for the sheep after lambing and at any other time when feed is dry.

Berkshire Progress Praised

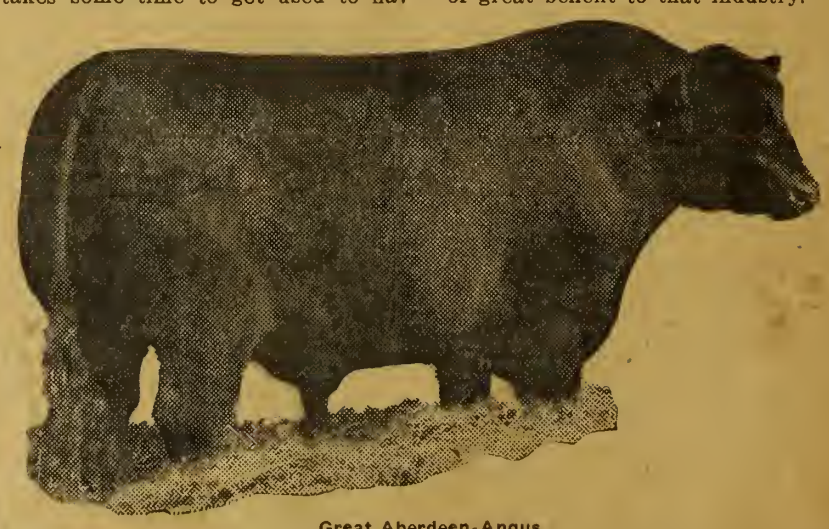
C. H. Gentry of Detroit, Michigan, a cousin of N. H. Gentry of Missouri, the famous breeder of Berkshire hogs, was a recent visitor to Glenn County. It will be remembered that N. H. Gentry bred the great boar Longfellow, to which practically all Berkshires in America trace. The notable exception to this is the Gossard herd of English Berkshires about which there is so much discussion in Berkshire circles now.

C. H. Gentry was very much pleased to find so many fine Berkshires in California and predicts a particularly bright future for the pure bred live stock industry here.

Whenever a number of enterprising farmers or stockmen in any community raise stock of any one breed, their success is sure to be greater than when only one breeder is engaged in the business. Glenn County Berkshires are gaining a large amount of national publicity, and eventually buyers will be attracted from all over the world.

Glenn County Fair

Plans are under way for a splendid agricultural exhibition at Orland this fall. The Glenn County Fair Association has bought the grounds in the town of Orland on which the fair was held last fall. Permanent improvements are now in process, fences have been built and a great many fine trees were planted last spring. Glenn County is one of the leading pure bred live stock centers in the West, and this fair is one of the things that will be of great benefit to that industry.



Great Aberdeen-Angus

Blackcap Poe sold for $9200 at the Escher and Ryan Ranch, Iowa, to A. D. Wilcox of Muscotah, Kansas.

Mesquite Beans in Arizona
Collected by Indians and ready to be ground and fed to hogs. Photo by E. P. Taylor.

Hay Conservation

I believe that every one planning to build a hay barn should give particular attention to the question of cut hay. There is a growing tendency among all the stockmen I know to favor the feeding of cut or chopped hay. There are many whose plans for the future include the installation of machinery to do this work. They may not get around to it for a year or two but they hope to get it done soon. I would be glad if we were equipped to cut our hay for the Shorthorns and Shropshires at Butte City Ranch.

To be able to eliminate the losses that are sure to occur in feeding loose hay is a big item. When the stems and branches of alfalfa are cut up fine everything is eaten, and this without waste if the feeding troughs are properly constructed.

I understand that when cut hay is stored in barns of ordinary construction the sides are apt to be forced out on account of the very much greater pressure. In building a new barn it would be well to consult some one who has built a barn to hold cut hay.

Grasshoppers

There are a good many grasshoppers in the upper Sacramento Valley this season. A grasshopper poison recommended by the Glenn County farm bureau last year that proved effective consists of the following: Paris green, one pound, blackstrap molasses, two quarts, lemons, ground fine, six quarts; bran, 25 pounds; water, four gallons.

Mix the molasses and water, dissolve the Paris green in a small quantity of water and add this and the lemons. Sprinkle the solution over the bran and stir thoroughly. This will cover about five acres. It is claimed that if it is sown thinly there is no danger of poisoning stock.

Five years ago—when the Monroeville orchard was planted, we had a bad infestation of hoppers. We used poison and it killed thousands, but there were thousands more. Over 5000 young trees were covered with mosquito netting in order to keep them from being defoliated.

MESQUITE BEANS AS FEED

By E. P. Taylor, Director Agricultural Extension Service, University of Arizona

An interesting instance of utilization of the native mesquite bean so abundant in parts of southern Arizona was observed upon two ranches in the Yuma Valley last year. W. C. Horan of Bard, California, across the Colorado River from Yuma, fed 390 hogs upon mesquite and screw beans. E. T. Sanguinetti of Yuma bought and fed to hogs between 20 and 40 tons of mesquite and screw beans which were gathered by Indian women in the Colorado River Valley and for which they were paid $18 to $20 per ton. A part of the beans were fed along with cocoanut meal and the results were satisfactory, though it was found that the hard bean seeds should be ground before feeding, as otherwise they were so hard they passed through the animals undigested. A rich sugar is within the pods. The mesquite bean crop promises to be good again this year, and the range cattlemen will profit thereby.

N. H. LOCKE JERSEY SALE

Written for California Cultivator by C. A. Briggs

Unsettled conditions of labor and feed are the factors that are making sales of cattle rather unsatisfactory to the seller at the present time. N. H. Locke's famous show ring herd of Jerseys sold at Lockeford July 6 by the California Breeders Sales and Pedigree Company was no exception to the rule. Prices ranged very low, much below the real value of the animals sold. The top prices paid were $510 for the celebrated Empress Lass knocked down to G. A. Moore, Ripon; $500 for Valets Golden Biddy of L to J. E. Thorp, Lockeford.

The fine stock in this dispersed herd will add much to the building up of the many herds to which they went. The sales were mainly to dairymen in San Joaquin and Stanislaus Counties. M. A. Luce of Santa Rosa was a large buyer. Chas E. Hughes, manager of the sales company, conducted the sales, with Col. Ben A. Rhoades of Los Angeles and Col. D. L. Perry of Columbus, Ohio, acting as auctioneers.

ARIZONA HAS DAIRY COMMISSIONER

W. A. Barr, who has been for the past year agricultural agent of Maricopa County, and who was to have been transferred in the agricultural extension service of the university to the position of state live stock specialist, has been appointed by Governor Hunt to the position of state dairy commissioner.

This position was created at the late special legislative session as a war measure at the request of the dairymen of the state whose industry was greatly hampered and threatened in Arizona by the present war conditions.

Mr. Barr is an experienced dairyman and technically trained dairy expert, and while county agent of Maricopa rendered the dairy interests marked service which was greatly appreciated by the dairymen. They are especially pleased now with the appointment of Mr. Barr as state dairy commissioner.

State Fair at Sacramento, August 31 to September 8.

Serviceable Holstein Bulls

Best of Breeding at Bargain Prices

Why not head the herd with a son of KING MEAD OF RIVERSIDE, one of the very greatest proven sires of the Holstein breed. During the past year two of his daughters have completed strictly official year's records of 1215 and 1331 pounds butter, the latter record standing as the world's strictly official record. All of his daughters that have been tested for the year average over four per cent butter fat, which can be said of no other sire of the breed with over five tested daughters.

We can offer sons of this great sire as low as $250.00 out of well bred cows with high A. R. O. records. The dams of several of these have records above 800 pounds butter. His sons are all good individuals.

Also offer a few excellent sons of KING MORCO ALCARTRA, whose dam, TILLY ALCARTRA, is the greatest long distance producer in the world. She is now making the greatest record of her career, having produced in the first six months 18,750 pounds milk and 775 pounds butter. This is her fourth consecutive year above 1040 pounds butter, three of which will be above 1190 pounds.

Have also two or three very fine sons of SIR AAGGIE DE KOL ACME at serviceable age from high record dams. SIR AAGGIE is out of AAGGIE ACME OF RIVERSIDE 2D, holder of the world's strictly official yearly record and the two year record of 2426 pounds.

We are offering these young sires at surprisingly low figures, and no dairyman should overlook the opportunity. Their pedigrees and prices will be mailed on request.

Livestock Premiums

The California State Agricultural Society has hung up money prizes totaling nearly $30,000 for competition in the live stock show of the 1918 California state fair. In addition the usual ribbon awards, considered by many exhibitors to be of even greater value than the cash premiums, also will be made.

This year for the first time Pacific Coast livestock breeders showing at the state fair will be able to play to a regular circuit, which is to say that they won't have to depend upon the premiums to be given at the one show alone to defray the heavy cost of conditioning their stock for show purposes but will have the opportunity of competing for the cash awards to be made at a succession of California shows immediately preceding and closely following the state fair.

The state fair opens August 31. Five county fairs all of them with livestock exhibitions as their main feature, will be held during the month before. They are: the Monterey County Agricultural Association Fair at Salinas, July 30 to August 3; Ukiah Fair, August 5 to 10; Ferndale Fair, August 19 to 24; San Joaquin County Fair at Stockton, August 22 to 24; also, Napa County Fair, August 22 to 24.

Soy Beans for Hogs

There has been more interest this year in soy beans than any preceding year. Whether this crop will prove satisfactory and profitable in California in view of the low price for which it may be imported is a question, that is, considering the raising of the bean as a commercial proposition. But for hog feed, we note a writer in the Farmers Review makes a point in its favor. He says:

Soy bean hay makes an excellent brood sow feed during winter months. Throw a good sized forkful out to each three or four sows each day, and it will furnish them with the necessary nutrients to go along with the other grain, besides supplying them a bulky feed and keeping them busy a portion of the day.

Soy bean seed fed alone, or if constituting much over one-fifth of the ration, is too laxative for swine if fed for any considerable length of time. As has been suggested before, they are often worth more for seed than for feed after having been threshed, if of good enough quality for seed. Cull or cracked beans can, however, be profitably fed either whole or ground, but better results are equally secured where they are rolled or ground than if fed whole. Small pigs seem to be more subject to scours when eating soy beans than are the older hogs, but if beans are used in moderate quantity, for instance up to one-sixth of the total ration, no bad results will usually follow. On the contrary, the pigs commonly do better for receiving them. Corn six parts, middlings two parts, and soy bean meal one part makes a very satisfactory ration when the middlings and beans are fed either dry or in slop. The same feeds can also be self-fed, although it is best not to put the feed in self-feeders before the pigs weigh about 100 pounds as an average. Similarly, we find that pigs under that weight do not do as well in the cornfield, either with or without soy beans in the corn, as do those which are heavier in weight.

There is still much to be discovered about soy beans. We may learn to extract the oil and have remaining a soy bean cake of greater proportionate value than the beans; and we may find better combinations of rations than we now know. But even if we do not, it seems that this crop has already demonstrated its usefulness to such an extent that we must recognize it as a successful crop in connection with corn and as a probable

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

source of much home grown protein feed for swine in the future. County agricultural agents have seen the successful use of the soy bean on many farms and are pushing the crop. It deserves your serious attention.

The use of soy beans for hogs, as has been described, reduces the amount of tankage or other protein supplement which must be purchased or otherwise secured to furnish the best ration. A small amount of tankage, for instance one-sixth of a pound per pig per day, is desirable even with the beans. However, if some other good supplement, such as skimmilk, oil meal or middlings, is available, the tankage need not be used.

Cattlemen State Their Position

At the recent meeting of the cattlemen of the state at Davis the following resolutions were adopted:

That the organization undertake a census of beef cattle in the state; that a spread of $3.50 a hundred pounds should be recognized as a fair one between the price paid for the feeder and the price asked for the finished steer; that public slaughter houses are not to be recommended in California at this time; that the "middleman" is a necessity to the cattle business, but the "commission man" should be eliminated; that action be taken toward securing the establishment of factories for the canning of beef in some central California point to take care of this live stock that is now being marketed outside of the state.

A resolution calling for the importation of 200,000 Chinese laborers into California to help on the farms was voted down.

A committee was appointed to complete the organization of the new association.

For more effective work the association has divided the state into zones or districts, five of them: Southern California, San Joaquin Valley, Coast counties south of San Francisco, Central California and Sacramento Valley, extreme northern counties.

To Maintain Summer Milk Production

During the hot weather there is a great decline in milk production. Often the dairy cow produces less than half as much milk in August as in May. This decline is generally attributed largely to the flies, but the flies are only one of several causes. The main cause is the heat. Cows suffer from the heat even more than man because they do not perspire. During hot weather the pastures are usually short and the flies are troublesome. As a result the cows do not get enough food and so give less milk.

The milk flow should be maintained by all means, since if the cow once declines in milk production, it is almost impossible to increase the flow later. More reliance should be placed upon silage feeding during mid-summer. If silage is not at hand some green feed should be given. Or, if these are not available, grain should be fed. When it is hot the cows prefer to graze early in the morning and late in the evening. They should be in the pasture at these times and not kept around the barn lots any longer than necessary, according to C. H. Ekles of the University of Missouri college of agriculture.

To Aid Hog Industry

"Helpful Hints to Hog Raisers" is the title of a circular just issued by the agricultural experiment station of the University of California. This publication comes close upon the announcement of an agreement between the United States food administration and the packers of the Pacific Coast states whereby the average price of packing hogs bought at terminal points in California, Washington and Oregon will not be less than one cent under the food administration minimum effective on the Chicago market (such Chicago minimum now being $15.50 per hundred). The prices of market hogs being thus stabilized it is expected that regular producers will bend every effort to increase their stock, while the opportunity to utilize the waste on the farm by raising pigs, and then selling at a satisfactory profit, will interest many who have had little or no experience in raising and marketing hogs.

Protect Lambs from Parasites

Internal parasites, particularly stomach worms, are carrying on an offensive campaign at this time against lamb and wool producers. They will continue their operations without waiting for reinforcements, until the cool fall weather arrives.

Large numbers of ewe lambs that are being kept back for the breeding flock will need attention this summer. It is a much safer and a better policy to prevent lambs from being infested than to try to cure them, says Howard Hackedorn of the University of Missouri college of agriculture. The most practical means of prevention is by the use of fresh clean pastures. If practical, the lambs should be changed to fresh pasture every two or three weeks. If not, then the lambs should be put on a clean pasture at weaning time. The wheat stubble in which grass has been sown is an excellent place; the meadow stubble can also be used. During August the corn field is an excellent place to raise lambs as it is cool, flies are not troublesome, and fields are always free of parasites. Sheep on a large range are not so likely to become infested as those confined on a small area. Clean fresh drinking water and salt should always be kept before the lambs. Stagnant pools and water holes are sources from which the sheep are frequently infested.

Holstein Bulls

SIR PIETERTJE ORMSBY CANARY heads the herd. He is by Sir Pietertje Ormeby Mercedes and out of a dam that made 862.88 pounds butter in one year as a three year old, and she in turn out of a 1009.87 pound cow. His three nearest dams average 19,496.7 pounds milk and 877.29 pounds butter in one year. A few of his sons for sale.

The McCloud River Lumber Company
McCloud, California

Buy Your Next Herd Sire at Hollywood

We offer two exceptional values at the present time in young bulls.

No. 1—Born February 15, 1918

Sire—KING KORNDYKE SADIE VALE, the only 40 pound bull that has a 40 pound daughter.

Dam—S. V. H. ALTOANA ORMSBY, a daughter of Sir Veeman Hengerveld. She made 16.70 pounds butter in seven days as a three year old right after being unloaded from the cars from the east and is capable of a much larger record.
This young fellow is a splendid individual, three-quarters white, and is a splendid buy at the PRICE $500.00.

No. 2—Born May 9, 1918

Sire—HOLLYWOOD PIETERTJE KORNDYKE, who is by Hollywood Lilith Palmyra, 11 A. R. O. daughters including a 33.44 pound three year old, and out of Pietertje Korndyke Abbekerk, 712.9 pounds milk and 35.30 pounds butter in seven days, 3235.8 pounds milk and 141.6 pounds butter in 30 days, 9300 pounds milk and 375.0 pounds butter in 90 days. As a senior four year old she made 23,874.2 pounds milk and 984.83 pounds butter in one year, and she is a granddaughter of Pontiac Korndyke.

Dam—PIETERTJE HENGERVELD CREAMELLE, 621.5 pounds milk and 30.24 pounds butter in seven days, 2648.7 pounds milk and 124.18 pounds butter in 30 days, 16,633.8 pounds milk and 691.56 pounds butter in 305 days.
The dam and sire's dam of this calf average:

Milk seven days	667.10
Butter seven days	32.77
Milk 30 days	2,942.20
Butter 30 days	132.89
Milk one year	20,254.00
Butter	838.19

(Average of yearly records includes the 305-day record of his dam and the four year old record of his sire's dam.)

This choice young fellow is about two-thirds black, and his breeding on both sides is unexcelled. We recommend this buy as a sure money maker. He will not be here long at the price, $500.

Hollywood Farm
(The Home of Judge Segis)
F. S. Stimson, Owner **Hollywood, Wash.**

Elliott-Brant Rancho Guernseys

We have an especially fine bunch of young Guernsey bull calves to choose a future herd sire from. Guernsey bulls cross well with all breeds of cattle and they increase the quality and color of the milk as well as the quantity of milk and butter fat. The Guernsey bull has won the battle with the scrub cow.
We have calves from A. R. cows with different sized records up to 750 pounds of butter fat. Our prices are reasonable and are based on breeding and records. Write and tell us your needs and we will tell you how we can fill them.

D. O. Brant, Mgr.

Creamcup Holsteins Headed by the 33.92 pound bull Creamcup Champion Pontiac Burke. A few young bulls for sale. M. M. HOLDRIDGE, Rt. A. Box 437, San Jose, Cal.

Dutchland Sir Pietertje Creamelle

is a name that is becoming firmly entrenched in the story of high producing Holsteins in California.
By a grandson of the great transmitting cow Changeling, and out of a daughter of the former world's record cow Creamelle Vale, he is bred to great production and has already proven his worth with 18 A. R. O. daughters in our herd, records up to over 30 pounds butter in seven days.
We enjoy a steady sale of good bulls to dairymen, many of them coming back for their second and third bull. We believe we can fill your requirements in the bull line. Write us or visit our farm.

For Contagious Abortion
Thorough use of B-K as outlined in our Bulletin 52, "Contagious Abortion," is the surest means known of controlling Contagious Abortion, preventing Barrenness, and removing Retained Afterbirth.
Complete irrigation of the uterus and vaginal tract is easy with B-K. B-K kills the infecting germs and foul odors—heals the uterus—removes the slime and acid—no irritation—no straining. B-K is much more effective and safer to use than lysol, carbolic acid, Lugol's solution or coal-tar disinfectants, which do not cleanse the uterus, but make it more acid.
If your dealer does not have B-K, send us his name.
FREE BULLETINS: Send for complete information—"Special trial offer" and bulletins No. 52, "Contagious Abortion," and No. 136, "Calf Scours."

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

Capacity of Silos

PROFESSOR L. W. CHASE, of the Nebraska agricultural experiment station, has been giving a great deal of study to the subject of silo capacity, with the result that he has worked out more dependable tables on silo capacity than have heretofore been used.

Practically all tables heretofore accepted have given capacities which were too high. For example, a 14 by 30-foot silo has commonly been rated at 91 tons. In fact, many people call such a silo a 100-ton one when in reality only about 80 tons are put into it as usually filled.

Commonly accepted tables have given the tonnage which a silo would hold if filled to full capacity with settled silage. In most cases it is not practicable for a man to add more silage to the silo after the material has settled thoroughly. The result is that he thinks the silo, as filled with unsettled silage, contains a tonnage which is not a true measure of the contents unless the silo is refilled after the first silage has thoroughly settled.

Capacities of Silos Based on Depth of Silage Immediately After Filling.

Depth in feet when Filling Stops.	Inside Diameter of Silo in Feet 12	14	16	18	20
30	58.5	79.5	103.8	131.6	
32½	65.5	89.1	116.3	147.6	
35	72.5	99.1	129.3	163.9	202.2
37½	80.0	109.2	142.6	180.8	223.0
40	88.0	119.6	156.2	198.1	224.3
42½	....	130.4	170.1	215.6	265.9
45	.....	140.0	184.2	233.6	288.0
47½	....		198.8	251.9	310.8
50	.....		213.6	270.7	333.8

In figurng out the capacities shown in the accompanying table, Professor Chase assumes that the corn is in average condition, that the silo is filled in the usual way, the silage allowed to settle about 12 hours and the silo then refilled. The depth of silage shown in the table is that at the end of the second filling. This would usually be the full depth of the silo except where the roof prevents filling up to the eaves.

Silage varies considerably in weight but the results of five years' weighing show that the figures in this table can be used for average conditions. It would be possible to put considerably more tonnage in a silo by filling it with very green corn or by filling it slowly, so some judgment must be used in applying any table or method of measuring to arrive at the probable contents.

If silo builders and manufacturers will adopt the above figures and methods in rating the capacity of their silos, stated capacities will be more dependable.—Concrete Builder.

STOCK YARDS MUST HAVE LICENSES

All engaged in the business of conducting stockyards in which live cattle, sheep, swine or goats are received, held, or kept for sale, feeding, watering, or shipment, and all individuals, partnerships, associations and corporations, commonly known as commission men, order buyers, traders, speculators and scalpers engaged in the business of handling or dealing in live cattle, sheep, swine or goats in or in connection with such stockyards are required to secure licenses on or before July 25, 1918. Applications for licenses must be made to the Law Department, License Division, United States Food Administration, Washington, D. C., upon forms prepared for that purpose.

Field Notes from the Live Stock Men

L. A. Denker of Saugus (Boquet Canyon) recently made a sale of 12 of his fine Hampshire brood sows to Fred Wadleigh of Palmdale. Among these were some of Mr. Denker's winners at Sacramento last year. Mr. Denker is fitting a full herd for the Pacific Coast circuit, and also expects to show at the National Swine Show, Cedar Rapids, Iowa. He is getting some extra good show sows from the East.

J. B. Manley, manager of the hog department of the Conejo ranch, has just returned from the East with an exceptionally fine bunch of hogs which are being fitted for the entire Pacific circuit as well as the National Swine Show at Cedar Rapids, Iowa. The quality of these animals is the kind that all the breeders are after. They are the big mellow growthy fellows that make such easy feeders. It is like a hog show every day to view the herd at the Conejo ranch. Mr. Manley was gone several months in making this selection. His son, Harold Manley, had charge of the herd while he was gone.

Frederick M. Johnson of Napa writes that Johnson's Defender, who was featured as a "Breed Leader" in the Cultivator of June 15, has died. Mr. Johnson says: "Had he lived he would have made a strong bid for the grand championship honors at the coming state fair. I am going East in September to try to find a worthy successor to this boar as head of my herd, and plan to take in the National Swine Show at Cedar Rapids while back East. Let me say that I have had very gratifying results from my advertising in the Cultivator.

State Forester Homans has appointed 30 fire wardens in Placer County.

Mountain Bred Jerseys are Rustlers

R. E. Bushnell of San Diego County gives the above scene from one of the pastures in that county. He notes that the Jersey is some rustler and if given a chance in mountain pastures does well. Many of the larger ranges in that section show great numbers of Jerseys with brands on.

Cow Testing in Stanislaus

Stanislaus County has two cow testing association at present, and the advisability of forming a third is now being discussed. Approximately 500 cows have been signed up to date for the second unit of the farm bureau cow testing association. The first unit tests over 1500 cows each month, the Stanislaus association about 800.

The value of the cow testing association can be brought out by a statement of Mr. Bowron, who, through the testing of his cows has reduced his herd from 45 to 27 cows and is getting the same amount of butter fat today that he was a year ago when he was milking approximately twice the number, thus cutting down the size of his herd, requiring about half the labor and saving feed.

During June, 1918, 1513 cows were tested by C. E. Bresee, tester of the Stanislaus County farm bureau. Of this number 50 succeeded in obtaining a position on the honor roll. The best average herd goes to Jack Helm, of Turlock, with 1.35 pounds butter fat per day; second, Orburg Brothers of Turlock 1.31 pounds butter fat per day; and third to T. J. Cook of Turlock, 1.21 pounds butter fat per day. Stone, owned by Orburg Brothers of Turlock, heads the list with an average of 2.08 pounds butter fat per day; second, Mildred, owned by J. H. Minto of Patterson, 2.04 pounds butter fat per day and third, Spot, owned by P. Peterson of Gustine, 2.03 pounds butter fat per day.

Alfalfa Caterpillar Again Busy

The alfalfa caterpillar is again on the job. Like an ally of the kaiser he leaves destruction behind him. Stripping the leaves from the alfalfa plant, the bare stalks stand to mark his path. The worms or caterpillars are about one inch long. They are dark green in color with a white line, sometimes distinct, sometimes faint, on each side. The back is often darker than the remainder of the body. The adult of this worm is the yellow butterfly so commonly seen over alfalfa fields.

Control

Any cultural method which will tend to stimulate the alfalfa and reduce the length of time necessary to produce a cutting of hay will tend to hold this insect in check. Plenty of water and good cultivation are very effective. Care should be exercised to clean the field thoroughly when a cutting of hay is removed. No alfalfa about the ditches, levees and fences should be allowed to remain from one cutting to the next since these form sources of infestation. When a field is infested the alfalfa should be cut at as early a date as possible in order to prevent the worms from stripping off the leaves. However, this cutting should not be done until the alfalfa has reached its blooming period, to some extent at least. If the cutting is done at an earlier date the alfalfa will be so slow in starting that it will give the worms a chance to do a great deal of damage to the weakened plants. The above methods will generally control an outbreak of insects if applied throughout the season. However, it often happens that the larvae become very numerous before their presence is noticed. In such cases more drastic means must be employed. A brush-drag applied to the stubble to crush or roll the larvae in the dust will prove very effective. This method must be applied immediately after the removal of the hay. The brush-drag is made by taking heavy brush and nailing the butt ends to a 2x6 timber and then placing a similar timber on top of the butts and bolting the two timbers together. The brush should be heavily weighted so that it will reach the worms which have gotten into the crowns of the alfalfa.—Fresno Farm Bureau Monthly.

Patriotic Poultry Culture

Written for California Cultivator By Jean A. Koethen

IN THESE days of stress and strain when we are all urged to do our bit, and some are making the supreme sacrifice, it behooves the poultry keeper to consider just where he can apply patriotism to the business of keeping chickens. The commercial poultryman has done his share. He responded nobly last year to appeals for increased production which left him stranded high and dry on the shoals of high feed prices, unaided by a corresponding rise in egg prices. If he is able to be patriotic this year it is because of superior advantages in capital, equipment or salesmanship. Now it is up to the person who just keeps chickens — backlotter, farmer, side-liner, whatever name he goes by, —to put his shoulder to the wheel and do his patriotic best.

Patriotic poultry culture demands three things from the keeper of the smallest flock; the keeping of better poultry, a systematic effort to improve what he has, the enthusiastic support of the poultry industry.

He should keep better poultry because the best is none too good. "The hen that lays is the hen that pays" has been repeated so often that it falls on deaf ears. Does poultry pay? Certainly it does. The right kind always did, always will. The wrong kind never did. It is because most flocks are mixed, containing enough of the right kind to balance in a measure the wrong kind that poultry has paid as well and as long as it has. The war is weeding out efficient from worthless and compelling the elimination of the unfit.

"Better poultry" means better layers, better meat producers, more vigorous birds, chicks that grow more rapidly, hens that are prolific for three or four years. It means stock that has been bred for eggs or meat, as the case may be; in other words, pure bred stock, never mongrels. "Better poultry" implies better methods of housing and caring for stock. It means cleaner houses and yards, ventilation, disinfection, sanitation. It means intelligent feeding. More than all, it means keeping but one breed. Only an expert can do good work with more than one. The men who have made names for themselves as breeders have done it in most cases with one breed. To keep one breed for eggs and another for meat is absurd, for any dual purpose breed answers both requirements perfectly.

DE LAVAL
CREAM SEPARATORS
Save Cream, Time and Labor

Save Cream: If you are trying to get along without a cream separator, or are using an inferior or half-worn-out machine, with butter at 40 to 50 cents a pound, a De Laval would soon save enough cream to pay for itself.

Save Labor: A good cream separator is a big time and labor saver. And this year, more than ever before, time saving and labor saving on the farm mean money saving.

There is no other cream separator that can compare with the De Laval in clean skimming, capacity, ease of operation, freedom from repairs, and durability.

Order your De Laval now when you need it most and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

GOVERNMENT LANDS

Oregon, California Government Lands—Booklet free. Tells "How, Why, Where." Write Joseph Clark, Sacramento.

OPEN AIR FARM BUREAU MEETINGS

Stanislaus County farm bureau centers have held several open air meetings. At Tegner and Wood Colony only a few were able to attend because of the rush season so that they just sat in their machines and had a social chat. Although these meetings are not conducted to the scheduled plan many points were brought out which were of considerable value.

At Hickman it was so warm the meeting was held in the school house steps under the spot light. It was so successful that they intend holding the rest of the summer meetings in the open.

Owing to low streams in the mountains hydro-electric power and irrigation water will both show such shortage before the season is over that the state railroad commission contemplates an early conference with the leading companies controlling power and water to determine as to possible rationing which may soon be necessary.

Stanislaus farm bureau schedule for August: Mt. View, 2; Hughson, 5; Jennings, 7; Modesto, 7; Denair, 11; Mitchell, 12; Thalheim, 13; Fairview, 14; Orange Blossom, 17; Wood Colony, 19; Hickman, 21; Ceres, 22; Patterson, 23, Claus, 28.

PATRIOTIC POULTRY CULTURE

Continued from Page 65

This experimental twist of the average mind which makes it impossible for many amateur poultry keepers to hold themselves down to one breed is responsible for a large part of the failure to improve the laying of the dual purpose and meat breeds. A is keeping Barred Rocks. His neighbor, B, tells him how many more eggs Anconas lay than Rocks, and A forthwith buys a couple of settings of Ancona eggs and lets the stock run with the Rocks. His Anconas may lay more eggs than the Rocks for a year or so, but ultimately he has neither Anconas nor Rocks. Two breeds require twice as much room as one, and, in order to accomplish anything worth while, one must hatch as many of each kind as he would of one if he had but one. It is said that 400 chickens must be raised in order to produce one show bird. If this is true, how far will any of us get with more than one breed?

But it is not enough to start with good stock. The best stock, without proper care, careful culling and intelligent breeding, degenerates with wonderful rapidity. This is why the fancier's business is on such a firm foundation. I believe I am putting it mildly when I say three-fourths of the fancy eggs and chicks and breeding stock sold never come to anything. Either the chicks are spoiled in raising or the eggs in hatching, or there is no attempt to keep the stock up to the standard by breeding from the best and only from the best. One need not be a fancier to pick out the best layers or the best cockerel in his flock or to mate the two. He needs only plain common sense and the desire to improve his flock.

This is the day of the booster. If you believe in your work or in the article you produce, boost for it. The public has a notion—how it got it is hard to imagine — that eggs are a luxury. Eggs are the perfect food. They contain protein, fat and iron, the substances most needed by children and invalids. One egg contains sufficient of these ingredients for a meal for any but the most robust, and is cheap at five cents. Where else do you get so much for a nickel? Certainly not in an ice cream cone. You can buy two eggs and a half for the price of a strawberry sundae, and your two eggs and a half would make a sustaining meal by themselves. Restaurant keepers know the value of eggs and charge accordingly. It is only the consumer, who has been accustomed to buying this most nourishing food product for less than it costs, that kicks at a fair price. Talk about eggless cakes and puddings. Why, it is just the eggs that make the cakes and puddings nourishing. Keep talking, egg producers, whether you have few hens or many. Educate the public in the value of eggs.

And while you are educating the public, don't forget to boost the industry of which you are a part, infinitesimal, perhaps, but still a part. Get into the organization, whatever it is, where you belong, and boost for that. Folks say poultry people won't work together. Let's show them better Boost for the best food there is and the people that produce it. That is what I call patriotic poultry culture.

Advertising the Egg

Poultry people are realizing the efficiency of advertising and in a large way are "going after" the consumer. These organizations: Poultry Cooperative Milling Association, Poultry Producers of Southern California, Inc., Poultry Breeders' Association of Southern California, American Poultry Association of California, Leghorn Association of California, Wyandotte Club of California will send greetings and make an address before the National War Emergency Poultry Federation Convention to be held this week in Chicago. In it they will refer to the fact that "it will be of some interest to know that the poultry production of California has a value of $35,000,000 per annum; that fully 70 per cent of California eggs are produced on farms where poultry culture is an exclusive business; that for the most part the breeders are pretty well organized, with cooperative bodies in the northern, central and southern portions of the state; and that in the way of modern methods and appliances they have utilized every means that tends to lessen cost of production, augment quality and enhance salesmanship. Prevailing economic conditions have nevertheless rendered poultry culture a rather hazardous occupation since the advent of the European war. These conditions (as applied to the country as a whole) in their varying phases will be ably discussed by people of authority before this convention, and (let us hope) with helpful results. With us in California, where eggs are practically an exclusive product on many poultry plants, we have found two obstacles in profitable salesmanship, viz., that when eggs attain a price of 50 cents and over per dozen they strike what the trade designates as the "dead line"—that is, they do not move in average quantities: this, combined with the fact that the average consumer being wholly unfamiliar with the nutritive value of eggs, assumes that they are expensive at five or more cents apiece, all the time buying meat products at prices that, food values and waste considered, are really more excessive. Paradoxical as it may seem, egg values in many households are a novelty, hence an intelligent and intensive advertising campaign exploiting nutritive values and intelligent preparation is needed, and the sooner it is put in operation the better for the future of poultry culture in this country. The idea that eggs are a luxury when selling at 50 to 75 cents a dozen, as compared with prevailing prices of other food products, must be exploded. The public must learn to appreciate the economy of the egg in its preparation, its small amount of waste material (about 10 per cent) its assimilative value and finally its sustaining power as a food; of all these things it is surprising how little the purchasing public really knows. Like milk, eggs are a food, easily digested if not damaged in cooking. A raw or soft boiled egg is easily assimilated and can be eaten with impunity by invalids and children. The average freshly laid product of the industrious hen by weight is worth more than as much beefsteak. Indeed, there is no more concentrated, nourishing food than eggs. The albumen, oil and saline matter are, as in milk, in the right proportion for sustaining life. Two or three boiled eggs with a slice or two of toasted bread. make a breakfast fit for the soldier in the trenches and the president in the White House. Then why not advertise and induce the public to eat them more freely?"

Results of advertising and the necessity of making known the food value of eggs and the fact that California breeders believe in advertising is followed by "in conclusion, gentlemen, the California poultry breeders ask that you endorse a country wide advertising campaign, to be executed by the various local organizations, exploiting the food value of the egg and advocating a greater consumption on grounds of economy to the consumer, to the encouragement of red meat conservation for the government, for the maintenance of the poultry industry on a living base, and for the winning of the war. This is California's poultry message to men and women here assembled as representatives of a billion dollar industry. Will they indorse it?"

Valuable Feed From Garbage

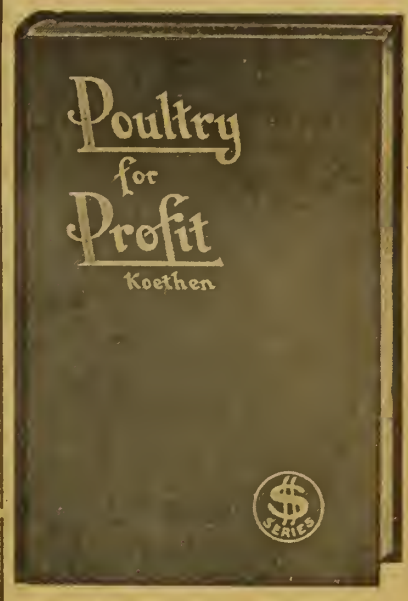
With an increasing understanding of the value of garbage, new methods are rapidly being developed for utilizing its ingredients most fully. One of the products now derived from city garbage is a concentrated poultry feed. The garbage is dried and treated to reduce the bulk and also to enable the product to stand shipment and storage. A typical sample of this feed tested about 17 per cent protein, ten per cent fat and 45 per cent carbohydrate. Although crockery and glass in the garbage does not interfere with its value for feeding poultry, the removal of such substances is essential when garbage tankage is to be fed to hogs.

A flotation process now furnishes means for separating the garbage from glass, crockery, metal and similar material so that the concentrated ingredients in the garbage may be converted into hog feed, dog biscuit and chick feed. The present commercial development and possibilities in this field show clearly its growing importance.

The food administration is endeavoring to convince city and town officials of the waste incurred when garbage is burned, dumped or emptied into large bodies of water. Changing methods of disposal may give farmers in many localities the opportunity to secure fresh town garbage for animal feeding.

Petaluma has not been content with the market situation this season. The egg market now is around 35 cents. Shipments out of the town are running above a half million dozen every week.

Poultry can be made to Pay



THERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe.

KICKING HORSE RIVER

By Pauline Johnston

It does not care for grandeur,
It does not care for state,
It flips its little fingers
In the very face of fate.
And when its course is thwarted,
Its current set at bay,
It just kicks up its saucy heels
And takes another way.

It laughs among the mountains,
It giggles at the kings,
It dances in the gorges
While a comic song it sings.
It ripples into waterfalls,
It ripples into spray,
And when they raise their eyebrows up,
It takes another way.

It does not care a button
For the granite of the rocks;
It never gets discouraged,
For it's never in a box.
When mountains contradict it
And canyons have their way,
It kicks a little higher
And takes another way.

PRESIDENT'S FOURTH OF JULY ADDRESS

SPEAKING at the tomb of George Washington, at Mount Vernon, on July 4, 1918, President Wilson said:

I am happy to draw apart with you to this quiet place of old counsel in order to speak a little of the meaning of this day of our Nation's independence. The place seems very still and remote. It is as serene and untouched by the hurry of the world as it was in those great days long ago when General Washington was here and held leisurely conference with the men who were to be associated with him in the creation of a nation. From these gentle slopes they looked out upon the world and saw it whole, saw it with the light of the future upon it, saw it with modern eyes that turned away from a past which men of liberated spirits could no longer endure. It is for that reason that we can not feel, even here, in the immediate presence of this sacred tomb, that this is a place of death. It was a place of achievement. A great promise that was meant for all mankind was here given plan and reality. The associations by which we are here surrounded are the inspiring associations of that noble death which is only a glorious consummation. From this green hillside we also ought to be able to see with comprehending eyes the world that lies about us and should conceive anew the purposes that must set men free.

It is significant, significant of their own character and purpose and of the influences they were setting afoot, that Washington and his associates, like the barons at Runnymede, spoke and acted, not for a class, but for a people. It has been left for us to see to it that it shall be understood that they spoke and acted, not for a single people only, but for all mankind. They were thinking, not of themselves and of the material interests which centered in the little groups of landlords and merchants and men of affairs with whom they were accustomed to act, in Virginia and the colonies to the north and south of her, but of a people which wished to be done with classes and special interests and the authority of men whom they had not themselves chosen to rule over them. They entertained no private purpose, desired no peculiar privilege. They were consciously planning that men of every class should be free and America a place to which men out of every nation might resort who wished to share with them the rights and privileges of free men. And we take our cue from them, do we not? We intend what they intended. We here in America believe our participation in this present war to be only the fruitage of what they planted. Our case differs from theirs only in this, that it is our inestimable privilege to concert with men out of every nation what shall make not only the liberties of America secure but the liberties of every other people as well. We are happy in the thought that we are permitted to do what they would have done had they been in our place. There must now be settled once for all what was settled for America in the great age upon whose inspiration we draw today. This is surely a fitting place from which calmly to look out upon our task, that we may fortify our spirits for its accomplishment. And this is the appropriate place from which to avow, alike to the friends who look on and to the friends with whom we have the happiness to be associated in action, the faith and purpose with which we act.

This, then, is our conception of the great struggle in which we are engaged. The plot is written plain upon every scene and every act of the supreme tragedy. On the one hand, stand the peoples of the world—not only the peoples actually engaged, but many others also who suffer under mastery but can not act; peoples of many races and in every part of the world — the people of stricken Russia still, among the rest, though they are for the moment unorganized and helpless. Opposed to them, masters of many armies, stand an isolated, friendless group of governments who speak no common purpose, but only selfish ambitions of their own by which none can profit but themselves, and whose peoples are fuel in their hands; governments which fear their people and yet are for the time their sovereign lords, making every choice for them and disposing of their lives and fortunes as they will, as well as of the lives and fortunes of every people who fall under their power — governments clothed with the strange trappings and the primitive authority of an age that is altogether alien and hostile to our own. The Past and the Present are in deadly grapple and the peoples of the world are being done to death between them.

There can be but one issue. The settlement must be final. There can be no compromise. No halfway decision would be tolerable. No halfway decision is conceivable. These are the ends for which the associated peoples of the world are fighting and which must be conceded them before there can be peace:

1. The destruction of every arbitrary power anywhere that can separately, secretly, and of its single choice disturb the peace of the world; or, if it cannot be presently destroyed, at the least its reduction to virtual impotence.

2. The settlement of every question, whether of territory, of sovereignty, of economic arrangement, or of political relationship, upon the basis of the free acceptance of that settlement by the people immediately concerned, and not upon the basis of the material interest or advantage of any other nation or people which may desire a different settlement for the sake of its own exterior influence or mastery.

3. The consent of all nations to be governed in their conduct toward each other by the same principles of

The Cultivator Patterns

8426—Ladies' Waist. Cut in sizes 36, 38, 40 42 inches bust measure. The waist has graduated frills at the front.

8809—Ladies' One Piece Corset Cover. Cut in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. The lower edge of the corset cover is gathered to a wide band of beading through which a ribbon is run.

8838—Girls' One Piece Dress. Cut in sizes 4, 6, 8, 10 and 12 years. The dress is in one piece and hangs straight from the shoulders and there is an inset panel at the front.

8841—Misses' or Small Women's Dress. Cut in sizes 16, 18 and 20 years. The waist is cut so that it fits the figure the least bit; the skirt is a two piece model.

8847—Ladies' House Dress. Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. The waist has a double breasted closing and is gatbered at tbe sboulders to give a becoming fulness.

8837—Children's Coat. Cut in sizes 2, 4, 6, 8, 10 years. The lower section of the coat is gathered to the yoke at front and back.

8844—Stout Ladies' Five Piece Skirt. Cut in sizes 32, 34, 36, 38, 40 and 42 inches waist measure. A narrow belt of self material is worn with this skirt.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT

California Cultivator
Los Angeles

honor and of respect for the common law of civilized society that govern the individual citizens of all modern states in their relations with one another; to the end that all promises and covenants may be sacredly observed, no private plots or conspiracies hatched, no selfish injuries wrought with impunity, and a mutual trust established upon the handsome foundation of a mutual respect for right.

4. The establishment of an organization of peace which shall make it certain that the combined power of free nations will check every invasion of right and serve to make peace and justice the more secure by affording a definite tribunal of opinion to which all must submit and by which every international readjustment that can not be amicably agreed upon by the peoples directly concerned shall be sanctioned.

These great objects can be put into a single sentence. What we seek is the reign of law, based upon the consent of the governed and sustained by the organized opinion of mankind.

These great ends cannot be achieved by debating and seeking to reconcile and accommodate what statesmen may wish, with their projects for balances of power and of national opportunity. They can be realized only by the determination of what the thinking peoples of the world desire, with their longing hope for justice and for social freedom and opportunity.

I can fancy that the air of this place carries the accents of such principles with a peculiar kindness. Here were started forces which the great nation against which they were primarily directed at first regarded as a revolt against its rightful authority but which it has long since seen to have been a step in the liberation of its own people as well as of the people of the United States; and I stand here now to speak — speak proudly and with confident hope—of the spread of this revolt, this liberation, to the great age of the world itself! The blinded rulers of Prussia have roused forces they knew little of—forces which, once roused, can never be crushed to earth again; for they have at their heart an inspiration and a purpose which are deathless and of the very stuff of triumph!

They Are Selling Bones for Food in England

Over in England at the height of the meat shortage and before the populace was put on rations, they sold bones at the rate of five pounds for one shilling. Policemen regulated long lines of people patiently standing out on the sidewalks, waiting, not for their favorite matinee idol to pass, but for a chance to enter a food shop and buy a small quantity of food. It takes about three minutes for the shop keepers to dress their windows over there, merely because there are, perhaps, but a few cans of condensed milk and a box or two of corned beef to be displayed.

Yet over here in America, bones, fats and precious scraps of meat are going into the garbage pails! Although in many cities there were long lines of people waiting last winter for supplies of coal, there has as yet been no pinched-faced mob pleading for food. True, there are frequently long lines of people on the street, but mostly they are buying tickets to shows! In the busy streets in towns and cities shop keepers display elaborate arrangements of all kinds of delicacies in their show case windows.

The accompanying pictures are from the Official Press Bureau in London. They were sent over to this country for the express purpose of showing what England was actually facing. A country in such straits not only needs help herself, but cannot possibly be expected to contribute to the support of United States troops now on the other side. The food shortage is real. Save food and "Carry On."

And You are only asked to save and not waste Food

COOK WITH PEARL OIL

Cooking Convenience

All the convenience of gas—that is the meaning of a New Perfection Oil Cook Stove installed in your kitchen.

Easy to operate. A touch of a match and in a jiffy your stove is ready for cooking.

No smoke or smell; no dust or dirt.

More convenient than coal or wood. Better and more economical cooking all the year round. A cool kitchen in summer.

And you have all the convenience of gas.

In 1, 2, 3 and 4 burner sizes, with or without ovens or cabinets. Ask your dealer today.

A New Perfection Oil Cook Stove means kitchen comfort and convenience. Ask your friend who has one. Used in 3,000,000 homes. Inexpensive, easy to operate. See them at your dealer's today.

The Garden Beautiful

IN CALIFORNIA

by Ernest Braunton

is a thorough treatise on soil preparation and cultivation and general care of flowers, plants, ornamental trees and shrubbery. Its 14 chapters with half tone and line illustrations and binding in silk make it a work that every home should possess.

Poultry for Profit

Read what Portland Oregonian has to say about this book and its author.

There is a woman down in California who knows more about poultry than all the men in the state, and this, too, for that matter. Her name is Jean A. Koethen, and she has written a book which is published by the California Cultivator of Los Angeles, and called "Poultry for Profit." It costs a dollar, postpaid, and it ought to be in the hands of every one who is keeping hens. This paper has reprinted a lot of matter written by Mrs. Koethen and, because of its quality, her book is recommended. Climatic conditions in these states are so nearly alike that what is good or bad for fowls there is the same here. The price of three dozen eggs will get the volume and its purchase is a good investment.—Portland Oregonian.

Send in $1.00 for book or $1.75 for book and California Cultivator.

HAY

Under date of July 13, Scott, Magner & Miller says:

Hay receipts past week, 2139 tons, about 50 per cent more than we received either last week or the week before with the natural result that prices are somewhat easier and if these receipts continue at about this rate or heavier we may look for lower figures to prevail as consumers have thoroughly made up their minds in most all instances to only buy from hand to mouth while these high prices prevail. Alfalfa remains about the same although arrivals have been heavier than for some time past and possibly there may be some decline in prices on this commodity should the receipts continue.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:

Fancy Wheat Hay (light 5 wire bale) .....26.00@27.00
No. 1 Wheat or Wheat and Oat Hay .....22.00@24.00
No. 2 Wheat or Wheat and Oat Hay .....19.00@21.00

No. 1 Barley Straw, bale .....50@80

GRAIN

Wheat—Government prices: Common white hard, base price, $3.50 per cental, or $2.10 per bushel of 60 pounds delivered in terminal warehouses in bulk; soft white, base prices, two cents per bushel less, or $2.08 per bushel; white club (Including Sonora), $2.00 per bushel. If wheat, after cleaning, weighs 60 pounds or more to bushel, base price stands; if 58 to 60 pounds to bushel, three cents per bushel reduction; if 56 to 57 pounds six cents per bushel less; if less than 56 pounds, grain becomes sample grain and sells on its merits up to within one cent per bushel of 56-pound wheat. Additional charge made for sacks.

SEEDS

Prices in round lots, lb.:
Millet, recleaned .....5@5½
Alfalfa, lb. .....20@21
Flax .....7@7½
Hemp .....5@5½
Rape .....2½@3

Citrus Fruit Market

Los Angeles, July 17, 1918.

Orange prices indicate streaked market condition or, perhaps, more of a streaked lot of fruit. The auctions show some sales close down to a dollar, others around eight dollars. In general a strong tone prevails.

A dispatch from New York dated July 15 says, "200,000 boxes of lemons afloat, but no sale scheduled as yet."

Shipments

Shipments of citrus fruits to date since November 1, 1917: Southern California; oranges 11,920 cars, lemons 4195. total 16,115. To same date last season oranges 32,840, lemons 6247, total 39,087. Central California this season; oranges 2536, lemons 115, total 2650. Last season to same date; oranges 4655, lemons 164, total 4819. Northern California; oranges 203, last year same date, 845.

AT THE AUCTIONS

July 10

New York: 8 cars Valencias, 3 lem. Val. 3.05-7.90, lem. 5.00-6.00, grapefruit halves, 1.40-3.60.

Philadelphia: 6 val., 2 lem. Val. 2.80-7.25, lem. 4.55-6.05.

St. Louis: 4 lem. Lem. 4.65-7.00.

Boston: Val. 5.20-6.50, lem. 5.15-6.10.

July 11

New York: 9 oranges, 4 lem. Val. 4.55-7.40, lem. 3.70-5.75.

Boston: Val. 3.10-7.40, lem. 1.45-6.30.

Cincinnati: 1 orange, 4 lem. Val. 6.40-6.75, lem. 2.25-6.10.

Boston: No oranges sold. Lem. 5.60-6.85.

July 15.

New York: Val. 4.10-8.05, lem. 1.90-6.50.

July 16

New York: 9 oranges, 6 lem. Val. 5.30-7.75, lem. 4.25-6.20.

Philadelphia: Val. 6.55-7.30, lem. 4.30-5.55.

Boston: Val. 5.80-6.20, lem. 3.40-5.95.

MARKET NOTES

Potatoes and onions are both showing stronger market conditions in San Francisco.

California shipped during last week 180 cars of yellow onions. Price ranged around $1.25-$1.50 f. o. b. Stockton, and sold in Chicago at $1.75 to $1.90.

Carlot Southern California potatoes are selling around $1.75 with extra fancy stock going to $1.85 f. o. b.

The state department of agriculture for Washington estimates 7250 cars of apples in the Yakima section and 6200 cars in the Wenatchee district. The Spokane district will have a material increase over last year and estimates its output at around 1000 cars. June drop of apples was very heavy.

Egg receipts in San Francisco last week were larger by a thousand cases than usual at this period of the year.

In making preparation for the shipping season the Wenatchee apple growers have provided for solid apple trains which go out on regular schedule, arriving in Chicago on the eighth day.

Turlock's first car of cantaloupes was sent out Thursday the 11th.

Imperial Valley has closed its cantaloupe season with a total of about 4500 cars.

Hanford is delivering its first dried apricots.

The announcement of the food administration that the price of raisins would be five and a half cents was feared to make a flat price, but later information indicates that this is a base price for Muscats and sweat box only; Thompson Seedless will be on a different basis.

DRIED FRUIT PRICES

The government approved prices on raisins have been officially announced about one cent per pound higher than last year. Dried peaches have been announced at about three cents per pound advance over last year's prices. Growers will receive about 11 cents; the government takes 12,000 tons, just half of the dried peach output, leaving only that many tons to supply a demand in ordinary times calling for 30,000 to 40,000 tons. F. o. b. prices for apricots fixed at 13 cents for choice, 16 cents for fancy. Prune prices set, and the government takes all the three medium sizes, 50s to 80s, inclusive, at 8¾ and 9 cents.

Santa Rosa cannery reports the putting up of 115,000 cans of fruit daily.

The bureau of markets report of peach crop gives California 70 per cent condition as against 90 per cent condition in 1917, and with a total output this year 10,866,000 bushels, as against 14,151,000 last year. Conditions United States over indicate 54.3 condition. Georgia shipped 3300 cars of peaches up to July 1.

Southern California shipments during the first part of July were heavy. While the movement up to the 1st of the month was much lighter than last year, recent shipments have brought the volume up. Some of the principal districts have now finished shipping and others are cleaning up rapidly. A big falling off is expected the third week in July and few will be left to move afterward. Ninety per cent of the carlot shipments have gone out iced, as compared with 40 per cent last year.

Inspection of Central California fields in the delta district showed that plants were making an excellent start in the field. Transplanting will be practically finished by August 1; growers having made better progress than usual, with fully half of the acreage already set, in spite of labor difficulties. The area for the year 1918-1919 is estimated as follows: Sacramento County, 805 acres; Contra Costa County, 1100 acres, and San Joaquin County, 165 acres; a total for the delta district of 2070 acres. This represents a very material reduction from last season's planting. A special reporter at Watsonville, where 75 acres were grown last year, states that the crop is normal; seedbeds are good; the supply of plants ample, and the general outlook is favorable.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, United States department of agriculture, report is made of the following shipment of cars of products from California for the week ending July 15: Apples, 5; apricots, 75; blackberries, 5; cabbage, 7; cantaloupes, 3; carrots, 5; cauliflower, 1; cherries, 4; cucumbers, 1; dried apricots, 5; dried beans, 10; dried peaches, 1; dried peas, 2; dried potatoes, 1; dried prunes, 3; garlic, 1; grapefruit, 3; grapes, 13; lettuce, 2; loganberries, 20; mixed fruit, 24; mixed vegetables, 41; mixed fruit and vegetables, 11; onions, 88; peaches, 8; pears, 100; peas, 1; plums, 416; potatoes, 611; raisins, 57; strawberries, 2; tomatoes, 19; watermelons, 32; Arizona cantaloupes, 178; Arizona watermelons, 6; Mexican cantaloupes, 2; Mexican watermelons, 2.

OF COURSE

"Come on," said the first flea as he hopped from the brown bear's left foreleg, "come over and join me in a short game of golf."

"Golf!" exclaimed the second flea, hastily taking a bite of hyena, "Where in the realm of Barnum are we going to play golf?"

"Why," said the first flea, "over on the lynx, of course."—Boy's Life.

IS THE AUTO NECESSARY?

Continued from Page 3

baker. A great many farmers have trailer attachments to their machines in the Carpenteria Valley. The following is a list of farmers who use their so-called "pleasure cars" for carrying on the work of the farm: L. B. Cadwel, Carpenteria; Ed Baillard, Bern Franklin, Ed Ellery, Adrian Wood, H. C. Henderson, John Roderigues, Fred Lambert, Frank Lambert, Henry Fish Seed Co., L. M. Higgins, Ben Bailard, H. P. Drake, C. Lillington, J. Rook, all of Carpenteria; and J. G. Williams, Arthur Pallin, Tom Emmons, Elmer Kellogg, John More Jr. and Thos. Miller, all of Goleta.

This is but a few of the farmers near town. Nearly all other farmers further removed from here have machines and these machines are a necessity in their business and many of them must go considerable distance for supplies. Time is saved in getting machinery repaired as well as getting men to work.

C. S. Myshka, Farm Adviser, Mendocino County

A survey of the farmers in Mendocino County using their autos for farm business has just been received.

As an estimate I would say that not less than 90 per cent of the farmers use their cars in active farm work or in expediting farm business through making hurried trips for repairs, trading, etc.

J. F. Grass Jr., Farm Adviser, Merced County

I know of very few instances where the auto (the so-called pleasure auto) is not used in a business way around the farm. They are used anywhere for the hauling of materials for the farm, carrying products to the market, to transporting the manager or men from one branch to another. Many have trailers attached or adjustable parts to make small trucks out of their machines.

If you desire a few specific instances, I will say that the Robinson Bros. of Merced use their autos in going over the ranges looking after their cattle. H. C. Doyle of Merced used his machines in transporting material to the farm. Fay Batten of Dos Palos uses his machine for getting supplies to his ranch and delivering products to town. C. A. Rose of Winton uses his machine for transporting of products around the farm and from town to the farm. The Rodgers Bros. of Merced use their machine in cutting wood.

J. R. Hodges, Farm Adviser Los Angeles County, Covina

I am of the opinion that about four-fifths of the automobiles used by fruit growers are in connection with work on the farm or ranch going to and from, etc.

R. A. Welch, fruit grower, ranch three miles from town, goes up almost every day, sometimes twice.

S. Douglas has ranches outside of town and hauls men to work sometimes twice daily.

John Chasman has ranch and pumping plant outside of town, goes almost daily. Grant Chapman same as above. J. D. Webb, same as above. H. W. Bailey, same as above. J. Holly, same as above, and many others.

D. Camholtz, trailer attachment. J. Overholtzer, same. J. Raymond, same, and many others.

A good many use made-over cars for delivery, among them Frank Ohaver, S. A. Stowell and H. O. Fumigating Co.

A few old cars are being made over into tractors with more or less success, some doing farm work with them altogether.

G. H. Flournoy, Horticultural Commissioner Tehama County

Most of the farmers with whom I am acquainted in this county are using their automobiles in their farm work.

Names of farmers using automobiles: Arthur Mitchell, Arthur Wilcox, Olney Bert, Paskenta; Fred Hulse, C. E. Flournoy, J. J. Heavy, James Heavy, Flournoy; H. W. Samson, T. F. Flournoy, E. C. Schultz, O. W. Houghton, R. L. Houghton, Corning.

Names of orchardists using automobiles: Henry Allison, W. E. Glick, C. S. Jewitt, S. Summer, Corning; Fred Weeks and W. E. Johnson, Red Bluff.

A. L. Rutherford, Horticultural Commissioner Stanislaus County

I am not exactly clear as to meaning of "a pleasure car" as for your example it seems to suit the case of every farmer who has a Ford or like cheap car. For instance, my son has a Ford and is living on my farm and has no other conveyance. All his running about on the farm is done in this car. His wife takes her butter and eggs to town and gets their supplies in the car. So the car is used just the same as he would horse and buggy which he would have to have if he did not have the car.

I have a neighbor who has an Overland, which he drives only when on special trips and he keeps a horse and buggy for his business trips.

In the first case I would call it a business car, while in the latter I would call it a pleasure car, although in the first case the car is used Sundays for outing trips.

Another neighbor has two cars, one strictly business car and the other for pleasure.

Another has a Dodge coupe, which is quite stylish for a business car, but it is used as such. He being a grape buyer as well as a grower, used this stylish car for all his running about.

The fact is that 90 per cent of all farmers who have only one car, use it for business. The horse and buggy being slow 95 per cent of all farmers who have more than one car have one for a pleasure car.

The automobile has become a necessity on the farm, and the farmer who does not possess one is either behind the times or is too poor to own one.

ONE TRACK FOR WAGONS

The most radical action to be taken in connection with the standardization and elimination campaign in the farm wagon business will be the adoption of a standard track, thus doing away with so-called wide and narrow tracks and solving a problem that has vexed the wagon trade for many years.

This decision was reached at a meeting of the farm wagon department of the National Implement and Vehicle Association held in Louisville, Kentucky.

The above announcement is from the Tractor and Truck Review which gives the particulars of one of the largest meetings ever held by the manufacturers of wagons. This is a common sense movement which should have been taken up years ago.

Wagons have been made in a variety of tracks, the two principal ones being a wide track, or 60 inches, used largely in the Eastern and Southern territory and on the Pacific Coast; narrow track, or 54 inches, used in the Middle West, North and in Canada, as well as portions of the Middle East.

It was unanimously decided to adopt a standard of 56 inches, which is the standard track of pleasure automobiles and many other motor vehicles, so that after wagons are constructed of this track the farmer moving to any section of the country will be able to use his wagon without making any changes.

The next important change was the adoption of a standard box width of 38 inches, outside measure. Heretofore not only had this width been made, but many others, principally a 42 inch width on wide track wagons. There was some controversy over the loading of cotton bales in the new width, but the Southern manufacturers courageously agreed to adopt the new standard width. It is understood that the government is requiring the baling of cotton in smaller dimensions in order to economize in railroad car space.

The third important change was the adoption of three standard heights of wheels, namely, the 40 inch, 44 inch and 48 inch, which are to be used in combinations, enabling the use of but one standard gear. A restricted list of tire widths was also adopted, graduated by inches from two to four inclusive. There were several minor changes in construction made, but the foregoing are those affecting the trade throughout the country.

Know Live Stock

Characteristics of every breed—best methods of breeding, training and general care with specific directions on how to buy and sell are given in this best of all LIVE STOCK and COMPLETE STOCK DOCTOR BOOK, a 1400 page Cyclopedia of Live Stock for the Western Rancher and Stock Owner.

This is without doubt the greatest book value on the subject ever offered to readers of this paper. It is the only work of reputable competent authorship covering these important subjects, recommended for general popular use, as a safe guide for the farmer and stock owner, by educated surgeons and by the press. The author, A. H. Baker, M. D. V. S., was the founder and for 27 years Dean and Professor of Theory and Practice of Veterinary Medicine, Chicago Veterinary College.

A great book of 1400 pages.

If you would know all about Horses, Cattle, Swine, Sheep, Goats, and Poultry, their anatomy, with careful and illustrated analysis of the points of Domestic Animals with all the diseases to which they are subject, with remedies for the curable diseases, send for this great book. It explains by methods of object teaching, with written instructions, how to know diseases in domestic animals, the causes, prevention and cure.

Information and instruction are given in plain simple language free from technicalities, but scientifically correct. The remedies prescribed are readily obtained and easily applied.

Over 30 color plates and 1000 object lesson engravings, including one illustrated chart for accurately telling the age of the horse from six months to twenty-nine years old.

The Book, Livestock and Complete Stock Doctor, is published in a single neatly and durably bound volume of 1400 pages 6½x9½, weight seven pounds and bound in law sheep. A new copy will be sent complete to any address in the United States upon the following terms:

One subscription to California Cultivator at $1.00 and $6.00 in cash.
Two subscriptions to California Cultivator at $1.00 each and $5.00 in cash.
Four subscriptions to California Cultivator at $1.00 each and $4.00 in cash.
Five subscriptions to California Cultivator at $1.00 each and $3.00 in cash.
Six subscriptions to California Cultivator at $1.00 each and $2.50 in cash.
Twelve subscriptions to California Cultivator at $1.00 each with no additional payment.

This is an easy manner in which to obtain this useful and valuable book. Get up a club of 12 subscriptions to California Cultivator among your neighbors or send part subscriptions and part cash as above and you will find that the book will pay for itself in satisfaction to you many times over. We will refund money on return of book in good order if the book is not as advertised.

Why Is It?

That practically every tractor manufacturer (and there are 40) using K-W magnetos as standard equipment, include them in their specifications or catalogue?

They do so because the record which the K-W magneto has made for itself—by actual field operation—during the last ten years—has given it a reputation that *tractors built for quality* demand.

These 40 manufacturers pay more for K-W Magnetos but it is their assurance to the tractor buyer that he is being provided with the most reliable ignition system, guaranteeing to him a "No Trouble" service day in and day out.

Write for a list of K-W Equipped Tractors

K-W High Tension MAGNETOS

are *true* High Tension types. No Batteries and *no* Starting Coils are needed. The K-W Magneto starts any size motor *easily* and *quickly*. It gives the hottest known spark—fires any kind of fuel equally well—is timed accurately; and last but not least, its construction protects it against **dirt, water and oil.**

If you are not using K-W Ignition now, write us. Let us show you how a K-W Magneto will be a time, money and fuel saver for you.

Insist that your new tractor be K-W equipped. Look for the K-W Trade Mark.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The tractor is entitled to much credit for America's increase in food production, and as labor gets shorter the demands made upon the tractor must increase, nor is its use manifested only in the depth of plowing and large loads which it will negotiate, but another and more common use is shown on the cover of this issue of the California Cultivator. As soon as the separator has finished its work the tractor takes it and the flock of wagons loaded with supplies and quickly goes to the next job.

WHEAT 1919

The United States department of agriculture is appealing for a 45,000,000 acre planting of winter wheat for the 1919 crop. This will be an increase of seven per cent over last year's sowing. This would give, it is estimated, 636,000,000 bushels, the average yield being around 15.7 bushels per acre. Doubtless an increase in spring wheat will be urged and in excess of a billion bushels secured if weather conditions permit.

The American farmer has made good during the past two years. The new demand will be met if possible for the needs of war ridden Europe for another year will be even greater than in the past.

LIQUID GAS

At the recent Covina demonstration, or school, of fumigation it was plainly shown that with all the improvements which have been given to the orchardist in the matter of insect control, none is more important that the use of liquid hydrocyanic gas. More than a quarter of a century ago the method of fumigation was developed in this state and made a great factor in California's prosperity, but the methods have been faulty, as has been appreciated by every expert who has had to do with them.

A great step in advance was taken when the fumigation machine was brought into use and gas was manufactured so as to be not only more deadly to the scale but of lessened expense and less injurious to tents and appliances used.

Now comes the liquid gas which has to be injected into the atmosphere under the tent, and instant results are secured with no injury whatever to tents or other appliances from the corroding acid. Machinery for its use is simpler, less expensive and equally as effective. It will require some time for manufacturing appliances for using this new method of fumigation, but we believe the time will come when the old method will entirely pass.

POTASH

The benefits to this country from the war will not only be because of securing liberty for us and for the rest of the world, but will, in some respects at least, be material. Prior to the war practically all supplies of potash were secured from Germany for fertilizing and for manufacture of explosives. It was at one time feared a serious shortage existed, but not waiting for German production to supply us, this country got busy, and from seaweeds and the deposits of the desert has secured sufficient that there is no serious loss.

It will require several years of time and the investment of millions of dollars before potash sufficient for America's present agricultural needs can be provided at prices as low as the Stassfurt product can be laid down in Amreica.

For the immediate future the outlook is for diminishing crops from the potash-needing soils of the Atlantic coastal plain and consequent scarcity of and high prices for potatoes, cotton, tobacco, oranges, grapefruit, and garden truck, not only in the East but also to a lesser degree, in the rest of the country as well.

There is, however, ground for the belief that eventually we shall be independent of the German potash monopoly and able to meet any sort of competition from that source.

GREEN MANURE CROPS

The food administration has ruled: "No more bean straw, alfalfa hay, or other valuable stock feed is to be used in mulching or manuring of orchards." That is, of course, pending relief from feed shortage. This will raise a serious problem for many an orchardist because of the fact that stable manure is almost impossible to secure. Fertility in the form of chemicals is valuable if the soil is in right physical condition, but "With all your getting, get humus" has become practically a proverb in soil handling. If the grower is prevented from using hay or straw or manure, and other materials are not available, then he must proceed to make his humus out of the soil. It is a slow process, but with patience and intelligent planting of green manure crops soil conditions may be very greatly improved.

It is yet a bit early for the planting of the winter green manure crop. With abundance of water one might fit the ground and grow a summer crop of buckwheat, which requires only some five or six weeks to bring to maturity, and this could be out of the way for the fall planting of a leguminous crop. Meantime let's consider the best crop for the fall planting. It should be put in by September or at latest by early October. The Cultivator hopes that in an issue in August it may give special attention to cover crops, green manure crops, best time and methods of planting.

Have our subscribers hints of value? Send them in.

JUNE DROP

The serious loss to all citrus growers because of the hot wave of June, 1917, which caused some 60 or 70 per cent of the citrus crop to drop to the ground, induced serious consideration of steps which might be taken to lessen such a disaster another year. The specialists tell us that "June drop" may be because of fungous trouble, weather conditions, thrips, poor physical condition of the tree, and in fact, numberless other things or conditions. It was suggested that at least a step toward immunity from weather conditions might be secured by the planting of an early summer cover crop. Several orchardists have made careful tests, but, as often occurs, this proved "the exceptional year," and another factor had to be considered. This was alternaria citri.

This is by no means the first year that it has had to be considered, however, for the million dollar yearly loss which it has caused to California citrus growers called for an investigation, and the results of this investigation are embodied in Bulletin 290 of the University of California., "The June Drop of Washington Navel Oranges," and gives account of this fungus which is known to be connected with certain phases of drop phenomena.

Last year's drop was caused almost entirely by climatic conditions. Hence, the bulletin referred to, written by Professor Coit and Mr. Hodgson, had little of interest for the fruit grower. To counteract the results of possible hot weather in June of this year summer cover crops were tried, buckwheat being used almost entirely, but instead of the dry, intense heat of last year, moister and much milder weather was given, and the fungous trouble, alternaria citri, has made serious inroads on the next crop of Washington Navels.

Mr. Hodgson, who has been coworker with Professor Coit in the investigation, has been observing the behavior of fruits and trees this year under summer cover crops and as to the work of the fungus. He will discuss the matter in the next issue of the California Cultivator.

This Week's War Notes

Transporting of American troops to Europe is now going on at the rate of 100,000 weekly.

Another U-boat has crossed the Atlantic and off the coast near Orleans, Massachusetts, sank a tug and four barges.

The American Indian is making good on the Marne front and has used his Indian cunning to the discomfiture of the Germans.

Physical requirements for the United States army have been amended so as to make the minimum height 60 inches and the minimum weight 110 pounds. The minimum height for the regular army remains however at 62 inches.

The news regarding the killing of Quentin Roosevelt has been confirmed by the dropping behind the American lines of a note by a German aviator. Report has also come that Major Theodore Roosevelt, Junior, has been wounded.

Sales of war saving and thrift stamps increased rapidly during July, but total sales to date are less than $500,000,000. This leaves a billion and a half to sell before January 1. Nebraska leads with an average per capita purchase of $16.64.

Rumors continue of revolt in Hungary, and now comes Bohemia with reports as to mutinies and expressed willingness to join armies of the Allies. Many serious revolts have occurred, and at one point 150 officers and men were shot and many others arrested.

The cruiser San Diego, formerly the California, carrying over 1200 men, is reported to have been sunk off the Atlantic coast last Saturday morning. Practically all men were saved. As to whether the sinking was caused by mine or torpedo it has not yet been definitely announced.

Our wounded men are not only being given best of medical care, but American Red Cross women, with fountain pens and postcards, follow the doctors on their rounds between the stretchers at the Paris station reserved for the hospital trains. Each man gets a chance to dictate a few lines. "Tell the folks at home we are all right" is the message usually sent.

German prisoners held near Irkutsk, Siberia, have secured control of the soviet government, and it is feared this may have bearing on the entire Russian question. On the other hand, Moscow reports the capture of the town of Birsk by Czecho-Slovaks and the soviet troops are in retreat. The Czecho-Slovaks still retain possession of Vladivostock and talk of intervention by the Allies continues.

The German people are apparently seeing things and thinking more soberly. The Cologne Gazette says: "The present clash of hostile forces is the most gigantic and terrible conflict of mental and physical energy ever seen. There is no room for platitudes. Now begins the final phase of the war." "The people at home will follow the development of this stupendous struggle with the gravest attention, for the enemy is now challenging us to put forth our very utmost efforts." The Strassburger Post inquires: "From where do these troops come that the American transports have really brought more quickly than they were expected?"

The Allies drive on the Germans continues on the French front. Much ground has been gained and every day sees material advance on the part of the Allies. The heights nears Chateau Thierry have been captured; thousands of prisoners have been taken, also hundreds of guns of large caliber. All excepting dead and captured Germans have been pushed north of the Marne and the Yanks and French are now using pontoons and bridges constructed by the Germans to cross the Marne. French and Italians have pushed the enemy back from Rheims. The line in Flanders is comparatively quiet, but fierce fighting has been kept up by the English, who have also captured many prisoners. France is wild with delight over the present situation. French and Americans have crossed the Marne on a 12-mile front.

Santa Barbara Community Dryer and Cannery

By W. V. Cruess

DURING the past spring Santa Barbara planted most of the vacant lots and many of the small fields near town to war garden vegetables. The success of these gardens resulted in the production of many times more material than could be used in the fresh state.

The war garden campaign was carried out to a successful conclusion through the efforts of C. W. Kirk, Mayor H. T. Nielson and others. The war garden commission of the city selected Mr. Kirk to be director of the war garden work without salary.

When it became evident that there was to be a very large surplus of war garden material it was decided to install some sort of a plant that would preserve this surplus and prevent its going to waste. Through the combined efforts of R. T. Stevens and the writer, a dryer and a small canning plant were designed. Estimates of the cost were made and then followed a campaign to raise funds to erect the dryer and cannery. The success of this campaign was due largely to the efforts of F. P. Knott and Mr. Kirk. Ample funds were subscribed by the community to build the establishment. The building was donated by the city. This building was formerly used as a gymnasium. The equipment and material were then assembled for the dryer and this was erected in the manner described in the following paragraphs.

Plan of Dryer and Cannery

The accompanying sketch will give an idea of the floor space available and the disposal of the various units of the equipment. This sketch may assist other communities in placing their equipment for such an establishment. From the sketch it will be seen that the building utilized in Santa Barbara is rather peculiar in shape and consists of a room 30 feet by 45 feet with a long narrow room at the back 70 feet by 12 feet. This long hallway was utilized to house the dryer. The large room was used for the canning equipment and preparation tables, as shown in the sketch.

The Drying Tunnel

Several types of dryers were considered. It was finally decided to choose the dryer known as the hot air blast tunnel dryer. The dryer, as built, consisted of a tunnel 23½ feet long and 37 inches by 57 inches in cross section. The tunnel, as shown in the sketch and in the photographs, was built of tongue and grooving over a two-inch by four-inch frame. The frame consists of two-inch by four-inch uprights, placed at such a distance that the dryer is divided into seven compartments. The top and rear of the dryer are solid and made air tight by a covering of light asbestos board over one-inch tongue and grooving. The front of the dryer, as will be seen from the photograph, is made up of seven doors, each 40 inches wide and of the height of the drying tunnel. The doors swing upward on hinges placed at the top. They are counterbalanced by weights attached to light cables which pass through a pulley directly above the door and through another pulley placed in the wall. The bottoms of the doors are fastened in place by an ordinary refrigerator clasp. The location of this clasp can be seen in Figure 3. The floor of the dryer in Santa Barbara was formerly used in the old gymnasium as a bowling alley. It is of oak, smooth, and air tight. An ordinary pine floor would answer the purpose just as well. The main consideration in constructing the tunnel is that it should be as nearly air tight as possible. For this reason, the space at the edges and at the bottom of the door should be padded with felt or some other material which will make the door as nearly air tight as possible when it is closed.

The Fan

The dryer is built on the plan of the use of air suction rather than an air blast. The hot air is drawn through the dryer rather than blown. This utilizes the drying effect of the air to better advantage because of the partial vacuum formed in the dryer. The fan used in this case is a 35-inch planing mill exhauster, which is operated at a speed of 1100 revolutions per minute. This will handle something over 5000 cubic feet of air per minute. Usually a second hand planing mill exhauster can be found in San Francisco or Los Angeles. At the time this fan was purchased there were several fans of similar size available in the city of Los Angeles. The fan is operated by a ten horse power motor, although the fan is rated at six horse power. The fan is attached by its suction intake to the outlet end of the dryer by a galvanized sheet iron hood, as shown in Figure 4.

This connection should be as nearly air-tight as possible to prevent the sucking of cold air by the fan. If an exhaust fan can not be found, it is always possible to locate a blower type of fan. If this type of fan is used it can be placed at the intake end of the dryer and the hot air can be blown through the tunnel. This fan, while satisfactory, is not considered so desirable a type as the exhaust fan. The fan should deliver at least 5000 cubic feet of air per minute for a dryer of this size.

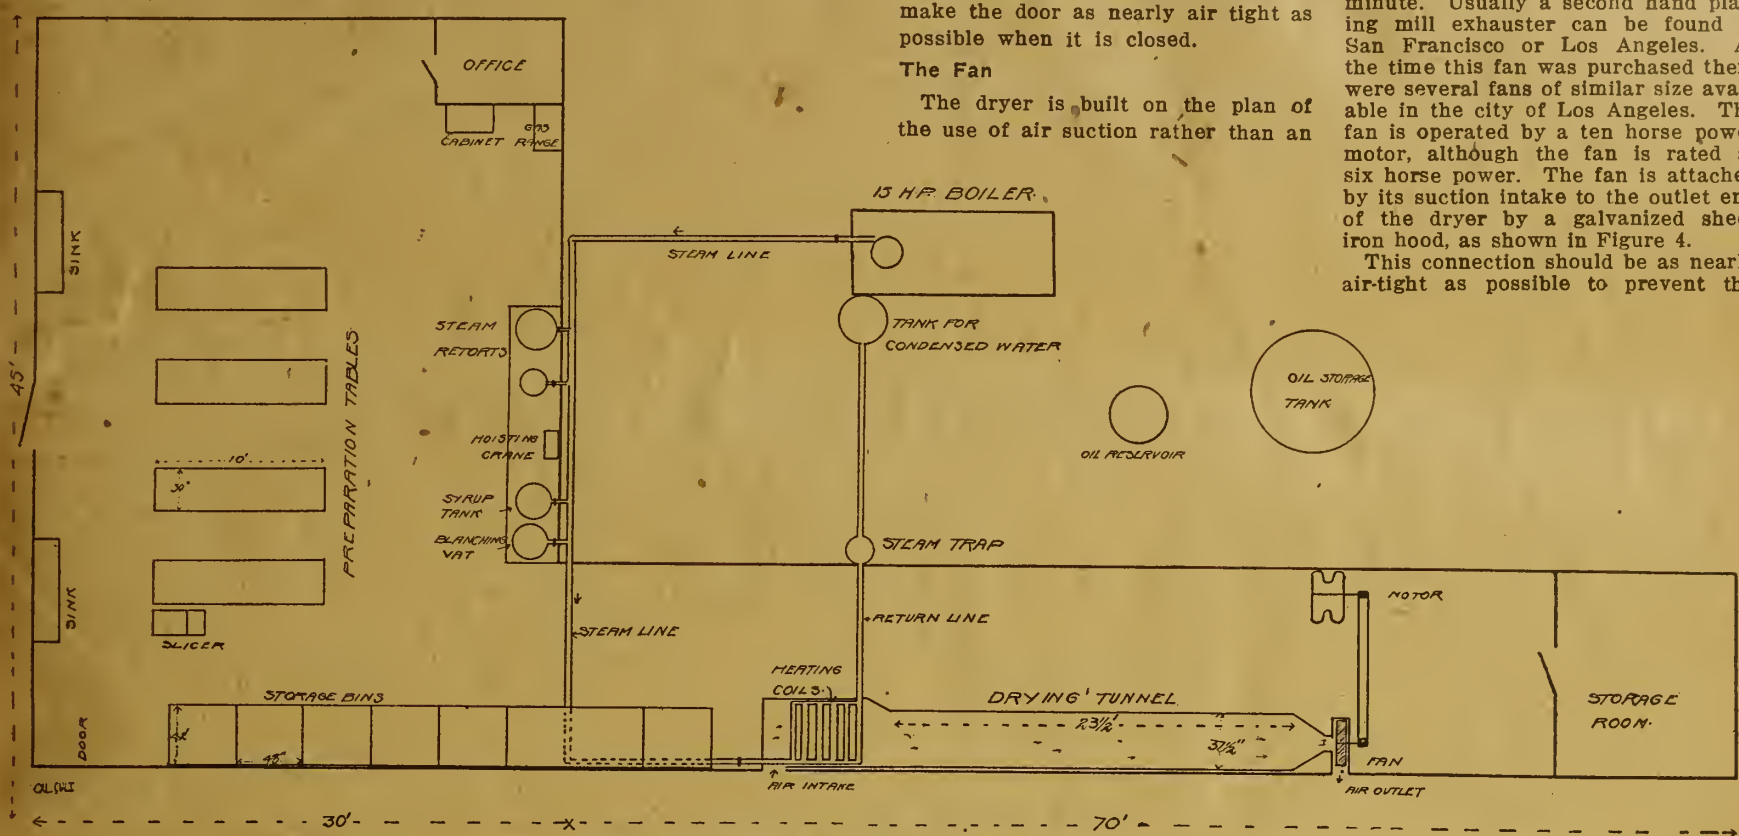

Fig. 1. Plan of Santa Barbara Dryer and Cannery

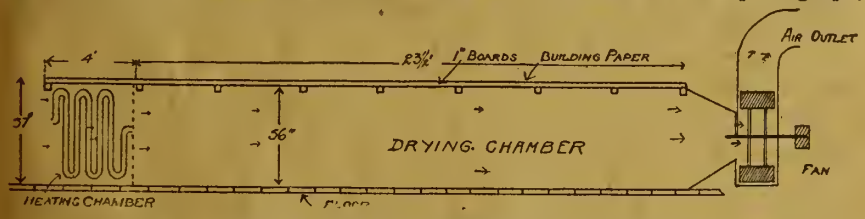

Fig. 2. Longitudinal Section of Dryer

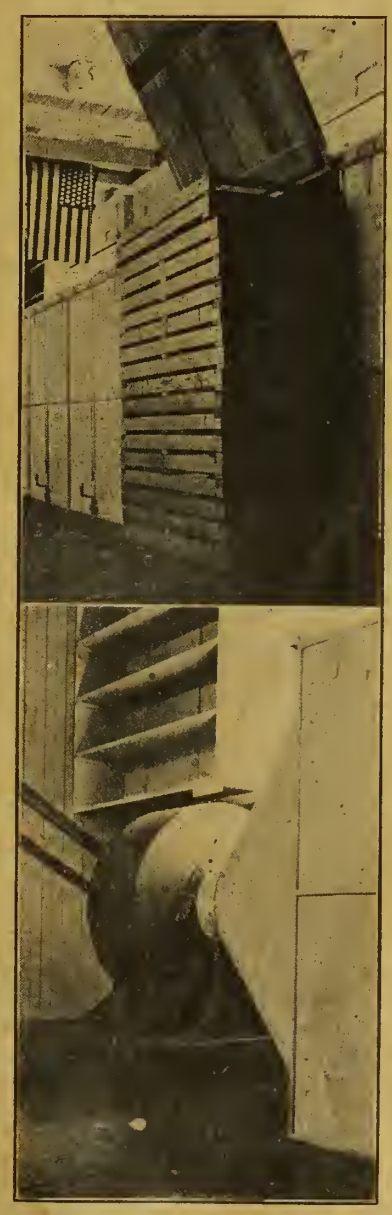

Figs. 3 and 4

Above, drying tunnel showing stack of trays ready for the dryer.

Below, exhaust fan showing on right connection of fan to tunnel.

Air Heating Apparatus

There are two methods by which air may be heated for a dryer. One is by a direct radiation from a furnace in which crude oil or coal is burned and the other is by radiation from steam pipes. The latter method was chosen because it can be more carefully and accurately regulated. To furnish the steam for the air heater, a 15 horse power boiler was obtained and installed. A ten horse power boiler would have been large enough for the purpose but a 15 horse power boiler was chosen because it was desired to use the extra five horse power for operating the cannery. The boiler is mounted on a cement base and is enclosed in brick. It is of the return tubular type and uses crude oil as fuel. A 300-gallon tank has been mounted about 20 feet above the ground to furnish the boiler with fuel. A storage tank for oil of 2000 gallons capacity has been set in the ground near the boiler. The fuel is pumped from the lower tank to the supply tank with a small hand power rotary pump. The heating compartment is connected directly to the drying tunnel. This compartment is six feet long and 65 inches high. It is 52 inches wide. It is joined to the drying tunnel by a slanting strip of wood 20

Agricultural News Notes of the Pacific Coast

Northern California

The cannery at Yuba City started its season's work July 20.

California state fair at Sacramento will be free to all soldiers.

Yolo County canners have agreed with laborers on wage scale.

Hayward Pigeon Club has arranged for a show November 2-6.

A sheep herder on Bald Mountain was fined $50 for leaving a camp fire unattended.

San Jose reports laborers in excess of real demand on the part of the fruit growers.

Napa fruit growers recently had the opportunity of attending a three-day apple-packing school.

A specialist of the department of agriculture has been recently aiding in fruit growing districts.

A grain elevator has been erected at Monroeville, Glenn County. This is the first for that county.

Eldorado County Duroc Swine Breeders' Association has elected Farm Adviser Jones secretary.

The Chamber of Commerce of Anderson, Shasta County, is discussing measures for mosquito control.

Placer County wants an olive packing and oil making plant. She grows some of the finest olives.

There will be farm center meetings in El Dorado County at Northside July 23, Placerville 25, Union 26.

Placer County fruit growers are discussing advisability of going to the Valley or to Nevada to buy carlots of hay.

Solano County's exemption board has made announcement that all men in Class 1 have been called to the colors.

Santa Rosa reports this year's crop of Gravenstein apples the biggest on record. Most of the apples will be shipped green.

It was rumored that the various creameries of Humboldt County had merged under one management, but this has been denied.

Amador County is anticipating showing its fitness for fruit growing by taking the step of securing horticultural commissioner.

One Sutter County orchardist grew 218 sacks of barley between fruit trees and reports trees growing and in best of condition.

Farm center meetings of Napa County will be held at Soda Canyon July 20, Chiles Valley 23, Union 24, Pope Valley 2, Mt. George 27.

A conference was recently held between white employers and Indian tribes near Lake Tahoe in the effort to induce the Indians to go into harvest fields.

Prune and apricot growers of Chico have joined the California Prune and Apricot Growers' Association, electing L. C. Shirley president and D. C. Irwin secretary.

The berry crop in the Gold Ridge section of Sonoma County will be largely harvested by high school boys and Y. M. C. A. workers. The crop is unusually large.

On the California State Colonization project at Durham, Holstein cattle and Duroc-Jersey hogs will be the only breeds allowed. Which breeds should be kept was determined by vote of the settlers.

Central California

Long staple cotton planted at Corcoran is showing up well.

Hoppers have done much damage in Tulare County alfalfa fields.

The Turlock district is now making heavy shipment of cantaloupes.

Tulare County grape and alfalfa crops are menaced by army worms.

Salinas observed its Big Week in its California Rodeo last week.

Grain farmers of Madera County are organizing fire protection volunteers.

A census of beef cattle in the state is urged by the California Cattlemen's Association.

There will be farm bureau meetings at Stratford, Tulare County, July 23, Oak Vale 27.

Monterey County bean growers are organizing a branch of the state bean growers' association.

Cotton gins are being installed at Bakersfield, Kern County, and Corcoran, Kings County.

The beets supplied to the Visalia sugar factory are coming from as far south as Kern County.

Final payments for 1917 dried peaches are just being made to the growers of Fresno County.

The United States department of agriculture forecasts the next corn crop at 3,160,000,000 bushels.

Ripon, San Joaquin County, has found its first year as a cantaloupe producer a complete success.

Sweat box price for Thompson Seedless has been placed at 6¾ cents; Sultanas, 6½ cents.

The campaign of fumigating citrus orchards because of gray scale began at Lindsay, Tulare County, last week.

Fresno County fruit growers are fitting up pickers' and harvesters' camps which are not only sanitary but attractive.

The Grange Patrons of Husbandry of Ft. Romie, Monterey County, is growing and many new candidates were given degree work recently.

Reports that the Alfalfa Growers Association would ask $30 a ton or that it had set any price at all are denied by J. L. Farrar, manager of the association.

Raisin growers feel that the outlook for a good crop and fair prices was never better. The Associated Raisin Company is in best of form in the markets.

The Visalia sugar factory is one of the first in the United States to take up the work of relieving the present sugar shortage. Its run began the first of July and shipments of A-1 sugar have been proceeding regularly ever since.

Forest supervisors are enforcing the regulations regarding the leaving of camp fires, and one visitor to the redwoods near Hot Springs, Tulare County, was recently fined $50 for leaving his fire, which had not been entirely extinguished.

The California Peach Company has arranged to deliver peach pits to the United States army to be used in the manufacture of gas masks. The peach pits make a charcoal having extraordinary absorbent qualities which when used in the masks enables our men to stay in gassed trenches for 18 hours while ordinary charcoal becomes saturated in three.

Southern California

Canneries at Hemet are now employing over 1200 people every day.

Prof. Fawcett is conducting scaly bark demonstrations before members of the Los Angeles County farm bureau.

California's production of beans will exceed that of last year by 25 per cent if present estimates are realized.

The South Coast Honey Producers Cooperative Exchange has filed articles of incorporation in Ventura County.

The Chino Valley Apple Growers' Association is making arrangements for its season's crop at the Narod packing house.

Citrus growers generally report setting of next season's crop as nearly normal. A very few sections report only 50 to 60 per cent.

Careless squirrel poisoners near Fillmore left sack of poisoned grain accessible to stock, and valuable horses were poisoned.

Imperial Valley has finally started some of its immense grain crop to market, some days seeing a dozen or more cars moving out.

The new big cannery at Chino, San Bernardino County, started on Thursday, July 11, on apricots; tomato canning will be taken up later.

Department entomologists report that infestation of cotton boll worm in Palo Verde Valley is very light, not over two or three per cent.

Employment bureaus in Los Angeles maintain that they have sufficient labor to handle all fruit crops in the southern end of the state.

Imperial Valley water shortage danger has passed after about two weeks shortage. Last year's shortage period covered nearly two months.

Pomona canneries are employing 500 hands on apricots. The output will be smaller than last year. Peach canning will begin about August 1.

Dr. H. S. Fawcett has returned from his two years in Johns Hopkins University and will again be connected with the citrus experiment station at Riverside.

Ventura County bean growers report a leaf hopper attacking bean vines and doing immense damage; no report is yet made as to name of the insect.

Rancho Sespe in Ventura County recently purchased $32 worth of Red Cross newspapers. They are to be used in wrapping young trees to protect from sun, rabbits and frost.

Hemet-San Jacinto apricot growers have added to their cannery a vacuum plant for making apricot jam; which will add greatly to the output of that section which has over 2500 acres of apricots.

Mrs. H. K. Davis of the department of agriculture, who was in Southern California encouraging greater use of cottage cheese and other healthful foods made from skimmilk, finds Southern California has done but little wasting of this particular food.

Los Angeles County farm bureau has found the average wage scale in that county: Hay harvesters, $3.00 without board; tractor drivers, $4.00 for small; $5.00 for large; teamsters, plowmen, fruit pickers, $2.75 without board; irrigators, 35 cents an hour; general farm work with board, $60.

The Coast and General

Montana pine is being used in aircraft building.

Much of lowland farm land along the Columbia River was under water during recent flood time.

The government has taken over importation of wool from Argentine, Uruguay and South Africa.

The Pacific Northwest will hold a second tractor and power farming demonstration in May, 1919.

Value of food sent by the United States to its allies during the past year aggregated $1,400,000,000.

Airplane mail service New York to Washington began July 10, time 2½ hours, or about 90 miles an hour.

The government of Tasmania is sending its pomologist, J. W. Ward, to study fruit culture in California.

The annual convention of the Washington Good Roads Association was recently held at Pasco, Washington.

Small sheep owners on the Minidoka reclamation project consolidate their flocks so as to save herdsmen.

The council of defense for Montana has loaned the farmers of that state $325,000 in order to increase crop production.

Latah County farm bureau, Idaho, is uniting its members who have a few sheep so as to handle the wool on the same basis as the large producers.

The state department announces that it has arranged to export to Mexico 1,500,000 bushels of corn in addition to other foodstuffs and agricultural machinery.

Banana bread is popular in Jamaica. It is made from green bananas boiled in salted water and added to ordinary bread dough in proportion of 30 per cent to the whole.

Owing to shortage of shipping, Argentina farmers are receiving only 54 cents per bushel for corn. The price of a ton of coal is more than twice that of a ton of corn.

Word has come from China of the death of Plant Explorer Frank N. Meyers, one of the best known explorers in the government service. He was drowned in the Yangtze River.

The Wenatchee district of Washington reports the largest crop of fancy cherries in years. The crop as a whole was not as big as last year but the proportion of fancy's was very large.

L. P. Branstetter of Marshfield recently brought 525 head of Hereford cattle from Stockton, California, and placed them on his stock range in the Coquille Valley, Oregon. The purchase price is reported as $20,000.

The federal government has contracted with the Chinese government shipyard at Shanghai to build four large cargo vessels, 10,000 tons each, and other vessels as soon as possible. The program involves $30,000,000.

The state inspector of Oregon has given warning to California potato shippers that if potatoes affected with tuber moth are shipped into that state an effort wil be made to declare a quarantine against all California potatoes.

A sugar board is the latest. It will take charge of all sugar supplies in the United States with a view to securing satisfactory distribution. President Wilson has advanced $5,000,000 of his special fund for the use of the board.

Control of the Red Spider

By E. Ralph de Ong

INJURY from the attack of red spider is beginning early this year and the more injurious form of webb spinning mites (Tetranychus) are reported from the middle coast counties where usually they cause little trouble. There are two species of red spider, or plant mites, common on prune, plum and almond trees and on beans: the one called Bryobia is not a web spinning mite, its body is usually a greenish color, but with red legs. These are found on the under sides of the leaves. The second and more injurious species is abundant in the interior valleys but is present also in the coast countries. These have a pale greenish or yellowish body, the adult showing dark spots at the sides of the body. These mites spin a light web on the under side of the leaf, scattered about in which will be found the eggs, transparent, perfect little spheres. Both of these species are so small that it is only with difficulty that they can be seen without a hand lens. Usually the first indication of their presence is the leaf turning pale or yellow, followed by defoliation if the attack is serious.

Injury by Red Spider

The spider feeds on the leaves of the plant attacked, piercing the leaf covering and drawing out the sap and chlorophyll (the green coloring matter), soon causing the leaf to turn pale and dry up. The attack usually begins on the lower leaves and extends upward until the entire plant is infested. The damage is more severe than that resulting from the attacks of most sucking insects, which feed principally on the sap, for the chlorophyll extracted by the spider is the substance necessary for manufacturing starch from carbon dioxide and water in the presence of sunlight, and when this action ceases the growth of the plant is arrested until more chlorophyll can be formed. Annual plants such as beans and squash may be entirely destroyed by the continued feeding of the mite. Almond, peach, prune and a few other orchard trees are frequently defoliated early in the summer, subjecting the tree to danger of sunburn and decreasing the amount of sugar and other nutrients in the almond and prune crop. Hence the output for the season is lowered and the store of plant food, produced by the tree for the early spring growth, is so reduced that the following year's buds are injured.

Dispersion

The mites thrive best in hot, dry weather, hence they are most abundant in the summer and fall, but nevertheless they were present in the spring on wild morning glory or other hardy vegetation, or, in the case of the Bryobia, on the trees where the egg was hatched. As the temperature increases in the early summer there is more of a tendency to migrate, and also they are becoming abundant enough so that the wind carries them about from plant to plant, thus starting new areas of infestation.

Control

Sulphur has for years been the standard remedy for red spider and is still the most satisfactory material, providing its limitations are known. Dry sulphur at a temperature of 70 degrees Fahrenheit or above gives off a volatile gas which is fatal to newly hatched spiders at a distance of a very small fraction of an inch. Hence it is necessary to make this application, first, at the proper temperature; second, early enough in the year so that the adult spiders present (which are not affected by the sulphur fumes) are not abundant enough to injure the plant; third, the sulphur must be evenly distributed and on the under sides of the leaves. Nothing is gained by throwing sulphur on top of the leaves nor in scattering it in coarse lumps through the plant or on the ground. Dry sulphur has been shown to be effective against the young mite over a period of two or three weeks while the eggs hatch in four or five days in the summer. Hence a careful application of dry sulphur before the damage by the spider is severe, or a wet spray of sulphur combined with a spreader such as flour, glue water or fish oil soap will quickly kill many of the young mites present at the time of spraying and will be effective over a sufficiently long period of time to kill the nymphs hatching from the eggs present at the time of spraying or deposited during the few days following. A coarse grain of sulphur is no more effective than a very small grain, for the fumes are efficient only over a small fraction of an inch, hence the necessity of great care in making the application. And since finely ground sulphur is equally efficient and easier to apply with dusting machines and less liable to be dislodged than coarse particles, it is very important that a fine grade of sulphur should be applied. Very finely ground sulphur does not always flow smoothly in a dusting machine, hence it is sometimes advisable to make a mixture of one part hydrated lime or kaolin and two parts of sulphur when applying a dry mixture. Sulphur thus diluted is less liable to burn than when applied pure; however, material should never be applied at a temperature above 100 degrees Fahrenheit if possible.

Orchard trees subject to the attack of red spider should receive an application of sulphur the first week in July or as soon after as convenient. In severe infestations two or three dry sulphurings may be necessary. Late planted beans should be treated about the first of August or just after the last cultivation and before the vines have matted, one application usually being sufficient to check severe damage.

Methods of Applying Sulphur

Sulphur may be applied in two ways, either as a wet spray or as a dust applied by means of a blower. Before sulphur can be used as a liquid spray it must be combined with a caustic to form a solution such as lime-sulphur or be made wettable by combining it with some other material so that it will remain in suspension in the spray tank. In this form it is applied with the common power sprayer. Our commercial insecticide houses are now putting out a finely ground sulphur combined with a spreader to form a paste which, when applied as a wet spray, gives a very even distribution of sulphur over the leaves. Professor George P. Gray of the University of California introduced last year a method of mixing sulphur and water by means of a solution of glue, one ounce of glue being used to a gallon of water. One and one-quarter gallons of this solution is required to mix ten pounds of sulphur, enough for a 200-gallon tank of spray, the materials costing less than 50 cents a tank. The mixture may be applied with any liquid spray outfit.

Dry sulphur has been applied by hand with tin sifters or cloth bags, but the more economical way and one which gives the best distribution is by means of a blower operated either by hand or by power. The Vermorel machine has been the standard in this country for years, but is now off the market. American machines are now taking its place, good knapsack sprayers being manufactured in California at present, and two makes of power blowers operated by means of gas engines are now available.

The comparative cost of hand versus power machines in sulphuring bean fields in the experiments carried on this summer are as follows:

Knapsack sprayer:

15 pounds of sulphur to the acre (Cost of sulphur based on a price of $4.50 per hundred.)	$0.67
Three-fourths to 1¼ acres per day (one man at $3.00 per day)	3.00
Total cost per acre with knapsack sprayer	$3.67

Power machine:

37.5 pounds sulphur per acre	$1.69
30 acres per day (two men and one team per day) (Power machine covers eight rows at a time.)	$8.00
Cost of operating machine, per day	.50
Total	$8.50
Average cost per acre	.28
Total cost per acre with power blower	$1.97

This leaves a balance in favor of the power machine of $1.70 per acre, but the greatest advantage in the power outfit lies in the possibility of treating a large acreage in a short time, checking an attack before it becomes serious and to a large extent irrespective of labor conditions.

Comparing the efficiency of the two types of machines, the cost of the power blower is no greater than that of the number of hand machines which will do an equal amount of work.

There seems to be little difference in the relative efficiency of wet and dry applications of sulphur providing the material is equally well distributed. The common experience of orchardists seems to be that a wet spray is more expensive than dusting but a better distribution is often attained together with greater adhesiveness. A dust spray is cheaper but it is often necessary to repeat the treatment on trees especially subject to attack. Dry sulphur on the leaves of almond and prune trees sometimes causes annoyance to the pickers by getting into their eyes, and in this case also the liquid spray would have a slight advantage.

Cooperative work in the control of spider is not as essential as with some other pests, each orchard being treated as more or less of a unit. It is true that the spider may be carried a considerable distance by the wind but this would only amount to a few rows, and the presence of sulphur would check new infestations over a period of several days.

Tractors Increase Man Power

The advantage of the tractor, like that of most other improved farm machinery, lies not so much in the reduction of the cost of performing a unit of work as in the fact that it permits one man to do considerably more work in a given time, according to Farmers' Bulletin 963 of the United States department of agriculture, which is a report of the experiences of over 600 farm tractor owners on representative corn belt farms in Illinois, collected during 1917 and the spring of 1918. This has been true of practically all improved farm machines, the bulletin explains. Even the grain binder, generally considered as one of the greatest agricultural inventions of the century, which has increased about eight-fold the acreage one man could handle, has not resulted in decreasing materially the cost of producing grain.

Men who hope to reduce greatly the cost of farming operations by the purchase of a tractor should bear these facts in mind. Judging by the experience of tractor users it is not safe to expect any material reduction in the cost of farm operations per acre through the use of the tractor, but it is safe to expect to be able to increase the crop acreage to a very considerable extent, and, at the same time, the amount of crops which one man can raise.

Furthermore, it should be remembered that the cost of doing the work with a tractor in most cases can not be directly compared with the cost of doing it with horses, since on farms where tractors are used a number of horses generally are retained, and any comparison, therefore, must be made between the cost of operating the farm with horses alone and the cost of operating with the tractor and a certain number of horses. Not infrequently horses stand idle while the tractor is being used for field work, because there is not sufficient help available to use them at the same time, and in such cases part of the cost of their maintenance must be considered when figuring the cost of farm operations, since they are as much a part of the farm power plant as is the tractor.

Not only should the relative expense of operation with the two methods be considered, but also the relative results. The increased crop acreage and consequent increase in incomes which the purchase of the tractor will often make possible may much more than offset a slight increase in the operating expense of the farm.

RURAL MOTOR EXPRESS

The United States food administration has endorsed the extension of rural motor express as an aid to food production and distribution. In a letter to the highways transport committee of the council of national defense, Mr. Hoover says:

"The development of the rural motor express idea in my opinion is in line of progress and should redound to the benefit of the producer, the consumer and the railroads. This means of transportation should facilitate delivery, conserve labor, conserve foodstuffs and should effect delivery of food in better condition."

The rural motor express plan which is already in operation in the vicinity of numerous cities is essentially a regular motor truck service enabling farmers to send farm products to town and get supplies, machinery and repairs without making a personal trip.

Prune Canvass Opens

OF interest to all prune growers is the statement issued by the California Prune and Apricot Growers in the Sunsweet Standard," their official organ.

On the morning of July 10 word was sent out from the food administration to growers' associations and packers dealing in licensed dried fruits, that all restriction regarding the purchase of growers' crops had been removed and associations and packers are now at liberty to contract for the delivery of 1918 prunes, peaches, raisins and apples.

Very prosperous conditions obtain in the prune industry. Unlike apricots, although we have suffered somewhat from the loss of an export market, we have a considerable government requirement that will largely make up for the market's restriction to the domestic trade. We have also, as compared with recent seasons, a rather light crop; whereas in apricots present estimates of dried production run into figures greater than production of any previous season.

These prices are of course named on a graded basis, and as many growers in the state have been in the habit of delivering and receiving settlement on the basis of the door test, it is understood the government is working on a scale of prices which will be more or less a just settlement on door tests. These prices, of course, cannot be accurately determined as the proportion of grades in different deliveries are never alike. The door test has been a simple matter in the past where the differential of $1.00 a point per ton has governed the price paid; but this year with the extraordinary premiums and differentials, this proportion has become so involved as to make a door test settlement rather a difficult matter. Growers in selling to the packers, it is understood, will be allowed to request a grading of their fruit, providing they are not satisfied with the method of settlement on a door test.

The association management has been particularly pleased to note that the plan of our organization absolutely meets the food administration's requirements under present war conditions. We have been inclined to believe that our form of organization is the only proper and scientific method of economically marketing our crop; and now that the government has come in with a desire to put the distribution of food products on a sound economic basis, we find ourselves already working along exactly the lines required.

During the next few weeks we are anticipating canvass of independent growers throughout the state with a view to securing their membership in our association, and have no doubt that under present regulations many growers will be induced to join with us. Under present regulations packers will not be allowed to pay exorbitantly excessive prices to any individuals, and growers will not withhold their membership in anticipation of such prices as were in some instances paid last season. We trust that all of our members will interest themselves in our organization work, and wherever you have neighbors or others favorably inclined you will acquaint our organization department of the fact, and we will have our representatives on the job. We must all realize that it is only according as we can maintain and increase our handling of dried prunes and apricots that we can anticipate the ultimate success for which we strive. We want you to assist us in our appeal to all growers to join with their neighbors in whatever profit or burden may be attached to the maintenance and development of present and future markets.—H. C. Dunlap.

Prices for Prunes and Apricots

As to prune and apricot prices, the Prune and Apricot Growers' Association issues the following:

Prune Prices

Government food control authorities, guided by information from prune growers have fixed maximum prices to be paid growers. These run as follows:

20-30's	15c flat
30-40's	10c base price
40-50's	9½c base price
50-80's	8½c base price
80-100's	8c base price
100-120's	4½c flat
120-up	4c flat

These are large prices and those who have a normal crop will, this year, receive good returns. But many have crops so light as to make returns below normal. The packer will doubtless be allowed to add 5 per cent to cost price as his profit in selling to the trade, and of course the association will receive the same and this comes back to the grower. Thus the association member will receive a little better than can the non-member.

The premiums on 30-40's and 40-50's of 1½ and 1 cent, cannot be had by a door test and can also be easily eliminated if the grader so wills. It will be a measure of comfort to the member who has been holding the umbrella so the outsider could beat the holder a little in price, to know that this year conditions will be reversed and he will beat the outsider in price. Not much, but some.

Apricot Prices

Growers can surely appreciate the present condition of the apricot market from the fact that since very early last season packing institutions antagonistic to our association movements have in no instance offered or paid particularly excellent prices for the dried product. Early in the spring in the case of some few growers who held dried fruit over from the 1917 crop, they were offered only prices in the neighborhood of 12c and were in many instances induced to join the association. So far no prices whatsoever have been offered to growers on the 1918 crop, although 12c has been rumored in a couple of instances. Some of the larger packing institutions have recently offered the new crop in the East at prices ranging from 10 to 16 cents in the grades from Standard to Fancy. These prices are slightly under last season, especially on the smaller grades. The association, taking into consideration the fact that the opening price must always be the lowest price at which sales are consummated and is always a price that can be raised when conditions warrant, and further, taking into consideration that only a small portion of possible production has been sold in futures, has seen fit to open with the following prices:

	Bulk Basis
Standards, pkd. under no brand	.09½
Slabs, " " " "	.11
Choice, Sunsweet Brand	.13
Ex. Choice " "	.14½
Fancy " "	.16
Ex. Fancy " "	.17½
Fancy Moorparks " "	.17½
Ex. " " " "	.19

On the Growers' Brand, ½c under these quotations.

WALNUT PROSPECTS

A serious situation is confronting many walnut growers because of "dieback," "kiil back" and winter injury. The tops of the trees in nearly all producing sections are showing this trouble. Commenting on the situation near Fullerton, the Orange County Tribune says:

Following the heat injury of last summer, many growers felt that the burning was so severe as to seriously affect the crop of 1918. But the prospects are for a fair crop in most sections. Where the heat injury was not severe, the trees have put out considerable new growth and show a good crop, there being quite a number of doubles. Where the burning was more severe the crop will be only fair.

The West Covina district seems to be in better shape on the average than either the Pomona or Whittier sections, in Southern California, but the crop is somewhat varied, even in different sections, some orchards being better than others.

What crop there is promises to be of excellent quality, the nuts being exceptionally large for this early in the season.

Winter injury, manifest by the dying back of limbs, is very prominent this season. A number of three and four-year-old trees were killed back to the ground. There seem to be two more or less distinct causes for the prevalence of winter killing this season.

The exceptionally long growing season of last year caused many of the trees to grow too late, and the wood was not properly matured, and, consequently, was very easily injured by even light frosts.

The growing walnut is almost as susceptible to frost injury as a tomato vine or bean. This type of winter killing is found on lands of low elevation, and more especially where the water-table is high and the tree is kept growing late.

Where the water-table is not high, irrigation should be stopped by the end of August to force the trees to mature their wood.

There is another type of winter injury which occurred on the higher lands where the wood was properly matured, and the cause may be laid to the extremely long, hot, dry fall.

In this case the injury simply is due to the desiccation or dying out of the limbs, such as is common with other fruit trees in the Great Palms area.

The best way to avoid this type of injury would seem to be by judicious winter irrigation, such as is practiced in the Santa Ana section.

FARM AND HOME DRYING OF FRUITS AND VEGETABLES

Farmers' Bulletin 984, which may be had free by writing the United States department of agriculture, Washington, D. C., is a 62-page bulletin with complete text and many illustrations. It is written by Joseph S. Caldwell of the office of horticulture and pomological investigations.

Imperative necessity demands nation wide conservation of those portions of our food crops which have

heretofore been permitted to go to waste. A considerable portion of this wasted food material is made up of perishable fruits and vegetables produced in home gardens and fruit plats in excess of the immediate needs of the producers and in the absence of accessible markets for the surplus.

Drying offers a simple, convenient and economical method for preserving food materials and permits the carrying over of the surplus into periods in which fresh fruits and vegetables are not so plentiful.

COMMUNITY DRYER

Continued from Page 75

inches wide, making the total length of the heating compartment almost eight feet. It is covered with light asbestos board. The heating coils consist of two units. One is made up of four steam heaters obtaining in all 50 pipes, 60 inches tall and one inch in diameter. These are plain upright pipes sealed off at the top with caps.

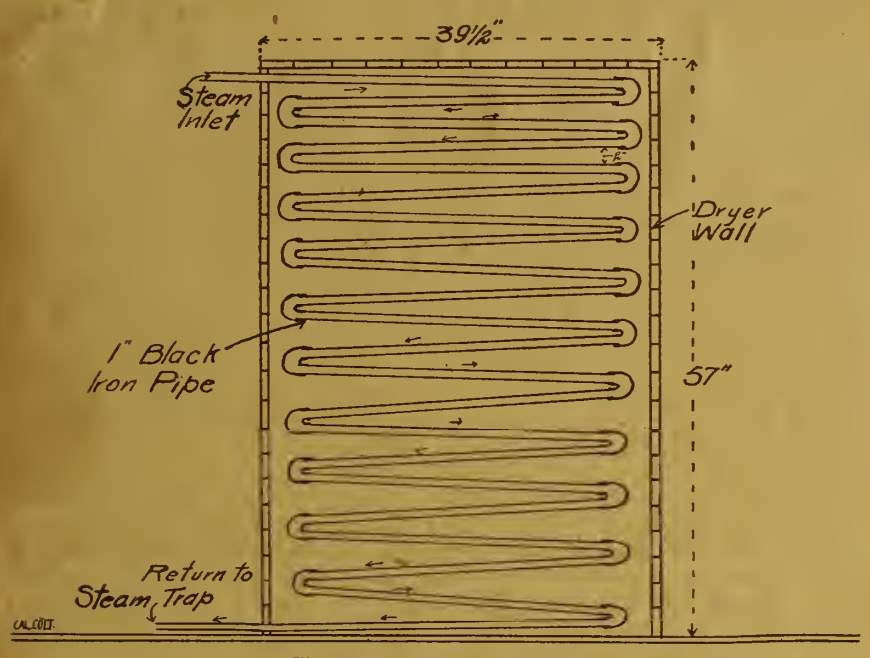

Fig. 5. Plan of Heating Coil

They are set in steam headers; each header being connected to steam line. The other unit consists of coils of one and one-quarter inch diameter and constructed on the plan of Figure 5, in such a way that all sections of the coils slant towards the bottom. This causes the water which condenses during the passage of the steam to flow downward toward the steam trap. The steam is admitted at the top. Between each of these coils has been placed a sheet metal baffle. The first baffle is attached to the roof of the heating compartment, the second one to the floor, and the others alternating in similar fashion, so that the air is forced to flow upward and downward over each individual coil and in this way absorbs the maximum of heat during passage. Steam at 100 pounds pressure is passed through the coils. The temperature is regulated by the amount of steam which is delivered. This is controlled by the use of steam valves located near the coils. A great deal of water condenses during the passage of the steam and this water of condensation is returned to a small tank near the boiler by means of a steam trap placed outside the building. The water of condensation is then pumped back into the boiler by a small boiler feed pump and used over again. The condensed water is especially desirable for boiler purposes because in the condensation process the lime salts are removed and there is less tendency for such water to corrode the boiler tubes. No data are yet available upon the cost of fuel for the operation of the dryer. The heating compartment opens to the outside air. This is essential in order that no moist air shall be drawn from the room.

(Continued next week.)

DANGER IN HOME CANNED FRUITS AND VEGETABLES

Home canned vegetables should be cooked always before serving, according to the California state board of health. The board also states that home canned fruits, especially when put up by the cold pack process, should not be used if there is even a slight suspicion of fermentation. This advice is not given for the purpose of discouraging the home canning of fruits and vegetables, but the board desires to acquaint the public with the facts relative to severe cases of food poisoning that have occurred in California and other states through the use of these home canned products.

Housewives are urged to recognize that the present methods of home canning are not entirely safe, especially in the hands of untrained workers. The chief danger lies in botulism, a poisoning which is produced during the growth of the bacillus botulinus, an organism that produces spores and grows in the absence of oxygen and is therefore very difficult to kill by the ordinary method of heating. When the spores have not been completely killed in the canning process, they proceed to grow under the favorable conditions, notably the absence of oxygen, which they find in the interior of the receptacles used in putting up fruits or vegetables.

Dr. Ernest C. Dickson of the Stanford University medical school has recently made exhaustive researches into botulism and he reports 32 outbreaks that have occurred in the United States, in which 81 persons were poisoned and 55 died. According to Dr. Dickson the increase in the number of outbreaks in this country bears a very interesting relationship to the marked increase in the practice of home canning of perishable goods which has taken place during the past few years.

Among the fruits and vegetables found by Dickson to have been the cause of botulism were asparagus, beans, corn, peas, apricots and pears. It is certain, however, that the growth of the bacillus is not confined to these particular products. Therefore, no chances should be taken with any fruit or vegetable that shows evidence of a slight degree of fermentation, spoilage or alteration of taste.

If the fact is borne in mind that the poisoning is due not to the germs themselves, but to a toxin or poison produced by them during their growth and that this toxin is easily kiled by boiling for a short time, there will be no need for discontinuing the practice of home canning. Make it a rule to cook all such products before serving and all danger will be absolutely eliminated.

SCALY BARK DEMONSTRATION

Los Angeles County farm bureau recently conducted at San Dimas a demonstration of treatment of scaly bark disease of oranges. H. S. Fawcett, Ph.D., and 250 orange growers discussed this topic and observed Dr. Fawcett's method of practical treatment. In a word the treatment consists of cutting out diseased bark and wood, painting with Bordeaux paste or a five per cent solution of carbolic acid. The formula for Bordeaux paste has been given in former Cultivators. The five per cent solution consists of five parts crystal carbolic acid to 100 parts, by weight, of water. Dr. Fawcett said one necessary precaution was inspection at least twice every summer by every orchardist. If taken at its inception scaly bark may be controlled. If, however, it is allowed to remain without treatment for years it not only becomes incurable so far as the tree is concerned, but may be spread to other trees. It is expected that Dr. Fawcett will now give much of his time to investigation of this particular disease which is but little understood.

Hit hard and quick for all we have and are and hope to be!

FOURTH LIBERTY LOAN

D. O. Lively, director of agricultural division of the twelfth district of the liberty loan executive board, writes: "From all indications the fourth liberty loan, which comes on in October, is going to be a whale. It does not require any argument to show you that the farmers will have to absorb a large part of this loan. They did splendid service in the last loan, but that was only a beginning." Mr. Lively then adds a note regarding the value of $2.40 wheat and some other points wherein farmers have been disappointed, and suggests: "Regardless of these or anything else the bond issue must be sold."

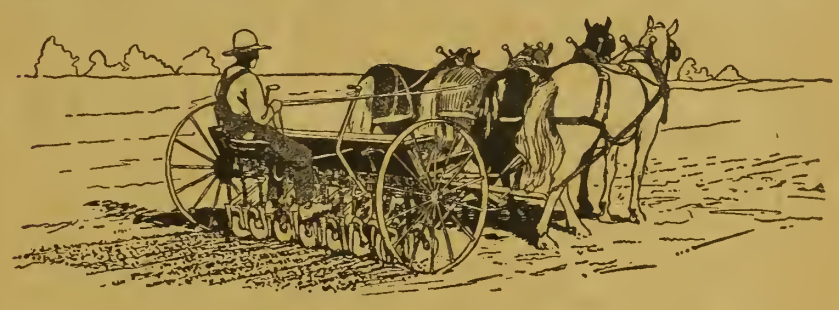
WHAT ARE DRIED APPLES?

The following definition and stand ard for evaporated apples was adopted by the Joint Committee on Definitions and Standards August 7, 1916, and was approved by the Association of American Dairy, Food and Drug Officials:

"Evaporated apples are evaporated fruit made from peeled, cored, and sliced apples, and contain not more than twenty-four per cent of moisture as determined by the official method of the Association of Official Agricultural Chemists."

The foregoing definition and standard is adopted as a guide for the officials of this department in enforcing the Food and Drugs Act.

Three Operations Finished In Once Over the Field



JOHN DEERE

VAN BRUNT

Single Disc Grain Drill

It is war time thrift to use a Van Brunt Grain Drill. In one trip over the field it pulverizes the soil, makes the seed furrows, drops and covers the seed. The Van Brunt Grain Drill makes horse power and man power available for other purposes—it helps solve the labor problem. Besides saving labor, a Van Brunt Drill will increase your crop yield because it does better seeding.

Patented Adjustable Gate Force Feed—Insures Even Seeding

All the seed is planted at the same depth—evenly, uniformly from every feed. All the seed reaches the bottom of the furrow. It matures evenly. No seed is wasted. Thorough seeding, you know, means much towards increasing your crop production. Van Brunt Drills do first class work in any soil capable of being seeded and do not choke up in mud, gumbo, sticky or trashy ground. Save labor, save seed and increase your crop yield by using a "Van Brunt" Grain Drill.

These Books Free for the Asking

"Better Grain Yields From the Same Fields"—32 pages beautifully illustrated, telling how to select, test and plant seed. Also *"Better Farm Implements and How to Use Them"*—a 156 page text book on farm implements. Worth dollars.

To get these books just state the implements in which you are interested and ask for package B P43.

JOHN DEERE, Moline, Illinois

Mr. Rancher:

Do you need hay and pasture for your stock? Do you know that if you will irrigate your land at once and drill in twelve pounds of Sudan Grass per acre, you can in eight weeks cut four tons per acre of No. 1 hay?

Irrigate and again in four weeks cut another two or three tons per acre, and after that pasture until destroyed by frost.

This is a fact! Try it now! Get your seed from

Aggeler & Musser Seed Co. 6th and Alameda Sts., Los Angeles, Cal.

Branch Stores: 115 North Main St. 767 So. Central Ave.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

Send today for full information and our latest catalog of earth-moving machines.

Schmeiser Manufacturing Company

22 Mechanic St. Davis, Cal.

Manufacturers of

Sure Pop Almond Hullers and Separators, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises, and Schmeiser Portable Automatic Hay Derrick. We sell the Martin Ditcher and Grader.

Farm for Profit

and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

Mulching Basins About Citrus Trees

THE citrus experiment station at Riverside has been conducting experiments in fertilizing, mulching and manuring citrus orchards for many years. In some cases indifferent results are secured and in others most enlightening results. The most informing plots are those on an orchard taken in hand after the profitable bearing age seemed to have passed. Various sections were planted to alfalfa, mulched with straw, hay, shavings, etc.

Another test is being made by Mr. Chase on his Corona orchard where trees are basined and irrigated regularly but a cover crop of weeds allowed the year around.

Final report is not made on either of these experiments. We note, however, that the United States department of agriculture believes that the serious consideration by citrus growers in that state of the mulched basin system is now justified. The department reports: Under this method low dikes are thrown up to form large, shallow irrigation basins near each tree and each basin is heavily mulched with alfalfa hay, bean straw, manure, or some other organic material. The object of this is primarily to prevent loss from mottled leaf—a disease which in its advanced stages markedly reduces the yield and quality of orange and lemon trees in California. This disease was found frequently associated with a low humus content in the soil, but there is also evidence that inadequate irrigation may be partly responsible for it.

In Bulletin No. 499, a professional paper of the department of agriculture, the results of a series of experiments to determine the extent to which the mulched-basin system overcomes these difficulties are set forth. It was found, say the authors, that this system conserves soil moisture better than any other method of soil treatment. None of the basin trees on either light or heavy soils wilted. The mulched-basin was also found to supply organic matter to soils badly in need of it more quickly than the use of mulches with furrow irrigation.

The experiments were also extended to include tests of different materials for the mulches. From these tests it appears probable that alfalfa and bean straw are of approximately equal value, while manure ranks next. Other legumes were much less beneficial. The yield where pine shavings were employed as a mulch was the lowest of all. As these shavings effectively protected the basins from evaporation, it is evident that the beneficial action of the other mulching material comes from the organic products which are carried into the soil from the mulch with the irrigation water.

For a basin with an area of 150 square feet, approximately 150 pounds of alfalfa, or 15 to 20 cubic feet of stable manure will be required each year to maintain an effective mulch. The material for the mulch, under ordinary circumstances, can not be grown between the basins because the amount of irrigation water available is not likely to be sufficient to supply cover crops without causing trees to wilt. For this reason the cost of the mulching material may seem in some cases prohibitive, but it must be remembered that the humus content of many citrus groves has been reduced to an extent that imperatively demands some means of restoration.

Estimate of Olive Crop

THE Fig and Olive Journal has canvassed the olive situation and estimates that for the state there will be between 60 and 75 per cent of a full crop. This estimate was made too early for positive figures, however.

Mission olives are quite light in some localities, one or two districts reporting only about 40 per cent of a full crop. This is the situation near Los Angeles. Manzanillos, on the contrary, seem to have set heavily, and the prospective crop of this variety is large.

From the Lindsay district comes the report that the olive crop there promises from 50 to 60 per cent of a normally full production. Missions and Manzanillos appear to be set in about equal quantity. Infertile bloom is given as the cause of the smaller crop in prospect in this section. The younger trees, those ranging from five to eight years old, seem to carry a larger proportionate crop than do the older trees. Hot weather in this district is not considered a factor in the setting of the crop.

Advices from Fallbrook in San Diego County are to the effect that it is yet too early to properly gauge the crop, but indications are that the yield will be much larger than last season.

Sacramento County, which is given a percentage of 115 by the horticultural commission, will have considerably less than this. A "fair" crop is our advice from this district, coupled with the statement that there was a very heavy fall of the bloom last month in many groves. As is usual, some groves show much larger crops than others.

In this section the hot weather is said to have caused "considerable" damage to olives, and in one district, at least, the expectation is for but 50 per cent of a crop, as a result of the hot wave. In this particular locality the heat seemed to affect Missions more than it did Manzanillos.

Our informant in Santa Barbara County tells us that there was very little dropping of olives in this section; though the weather during part of June was quite warm. The orchards visited by the writer showed stands that were "quite good." The prospective crop in Santa Barbara County is further described as "fair."

We are advised from the Hemet district in Riverside County that the trees examined show a light setting of fruit, this applying to Missions and Manzanillos equally. To tree conditions, rather than to the hot weather, is ascribed the light crop in this district.

From olive sections in the southern part of San Diego County we hear that the crop prospects are good. In fact, if all the olives mature that were on the trees at the time the report was made, these districts will have from 90 to 95 per cent of a crop, it is said.

While the weather became very warm in the Corning section last month, we understand from our correspondent there that little damage

resulted to olives. Missions are reported to be set a little better than Sevillanos in the Corning district, with Manzanillos fairly well set. About 90 per cent of a full yield is expected here.

Horticultural Commissioner Earle Mills reports the olive crop in Butte County as affected considerably by the June heat, and the yield is expected to be light.

Last reports from Phoenix, Arizona, indicated a good olive crop in prospect. The trees bloomed very heavily in the Salt River Valley and a good setting of fruit followed.

INTENSIVE AND DEFENSIVE CULTURE

Written for California Cultivator
By A. R. Gould

IN a contemporary we recently read something concerning intensive nonsense and comparative statements that intensive agriculture means less land and more labor, equipment, money, fertilizer, and extensive agriculture means more land and less labor, equipment, money, fertilizer and seed. Those who have practiced intensive agriculture will know by this time that there is much to be said in favor of close cropping and that it takes no more equipment to cultivate a small plot than a large one. It takes very little more fertilizer and not much more seed, and by using a sprinkler system very little more water.

The writer has several plots as follows in his home garden, size 40 feet long by nine feet wide, cropped with lettuce, two rows between three rows of peas, four rows of turnips, three rows of peas with two rows of lettuce between, three rows of turnips, three rows of sea kale beet, two rows of beans, Golden Wax, four rows of carrots, two rows of beans, Dwarf, two rows of beets, four rows of turnips, four rows of carrots. Plot two, size 12 feet long by four feet wide, two rows of dwarf beans and eight plants of tomatoes, early variety, grown on single stem, staked. Plot three, nine feet long by four feet wide, one row strawberries, two rows lettuce. All these are thriving and are yielding, in fact recently we used a row of radish from plot No. 2. If we left larger spaces between these crops and used up more land we should have more weeds to destroy and would use up about the same amount of water and fertilizer on the larger area.

Other evidence in favor of intensive culture we find in a report on the work of the Vacant Lot Cultivation Society of London, England, which by the way was started by that big-hearted American, the late Joseph Fels, whose work toward freeing the land in England is now bearing fruit. The writer met him some few years ago and realized what a true type of American he was. The government has now recognized this vacant lot movement, and small wonder, as we find that "there will be 1,500,000 allotment holders at work in good time for this year's crop," and the secretary adds: "Based on present retail prices these men and women will produce approximately $75,000,000 worth of vegetables, sufficient to satisfy the need of 7,500,000 people." Now this is war gardening and real intensive culture on the back lot and every little helps and we must remember that these allotment holders are townsmen and practically unskilled in the arts of cultivating the soil, but being in touch with an organized society which employs a capable instructor, they gain in health and knowledge. Furthermore, Sir Arthur Yapp, food controller there, declared recently that the allotment holders of the country had saved the situation as far as food was concerned. There is no need for any building sites to remain idle as they can become of great use to the community, especially at this time. Make intensive culture your first line of defense.

PLACER OLIVES

"A big share of our olives are shipped to Los Angeles in lugs, are pickled down there and go to market as a Los Angeles product," says Farm Adviser Amundsen. "Our olives are of good flavor and should be marketed as Placer County olives. Why cannot all our olive-growers cooperate and have the entire output pickled within the county. The cannery at Lincoln could install the necessary equipment for commercial pickling and oil-making. We would like to arrange a meeting of all the olive-growers to discuss the situation and make plans. It will mean more money to the growers, greater development of the fruit growers' cannery; and another industrial activity added to the county."

APPLY THE WORK-OR-FIGHT POLICY TO FARM MACHINERY

The work-or-fight policy should be applied to farm machinery as well as to men. Though machines can not fight they can be put to work on many occasions instead of standing idle in the barn lot. Most farm machines and implements are capable of doing much more work than they usually do, and the more they are used the less man labor will be required on the farm.

No man is rich enough to eat what his country needs.

HORTICULTURIST COMES TO UNIVERSITY OF CALIFORNIA

Dr. J. C. Whitten, professor of horticulture at the University of Missouri, has accepted the post of head of the division of pomology in the agricultural college of the University of California. Dr. Whitten, long recognized in the agricultural universities throughout the United States as one of America's leading horticultural educators, brings to California the benefit of his many years of study both here and abroad.

Somewhere on almost every farm there is a collection of discarded machinery and odd pieces of scrap iron. This scrap can contribute to the winning of the war by being converted into war material or new farm machinery. All this discarded machinery should be melted an incorporated in new castings. The aggregate scrap on American farms is enormous. The gathering up of it will help supply needed material, improve the appearance of the farms and yield profitable returns.

DOUBLE YOUR ACRES BY PLOWING DEEPER

Dry Land Plowing

The Proof of the Crop is in the Plowing

Mr. J. E. Plaskett at Yuba City, California, last year plowed a 300-acre adobe field, during the autumn while the ground was hard and dry. He plowed eight inches deep, turning up adobe and heavy sandy loam mixed; leaving it for the air and rain to disintegrate during the winter.

The rains came before he finished plowing, leaving five acres in the center to be plowed in the spring. When the barley crop was harvested there were 25 sacks to the acre on all but the five acres in the center; these averaged only 15 sacks.

Mr. Plaskett says it took him 40 years to find out that plowing the land when hard and dry, and plowing it deep, is the secret of good crops.

The bean and seed growers of Ventura and Santa Clara counties also plow when the soil is dry and hard, turning it up in big lumps for the air and rain to dissolve. Deep plowing opens the ground so the air and rain can get to it to air-slack, and mulch it.

The length of the season for plowing after the rain is too short—it is better to utilize the longer time in the fall after the crops are off. By dry plowing you avoid the possibility of the "plow-pan" or "water-pan"—for there is an uneven surface left at the bottom of the furrow.

Deep Plowing

It is Practicable with a Tractor

The Yuba Ball Tread Tractor is the ideal machine for deep plowing. The power generated by the engine is mostly delivered at the draw-bar.

It glides on steel balls—there is little friction. It is so perfectly constructed, of such serviceable materials, that the stoppages and loss of time to "fix" the machine are almost nil.

The Yuba is the tractor of rolling contacts. It has few sliding surfaces. It has roller-bearing transmission, ball-bearing swing circle and the ball tread.

The ball tread runs on two series of enlarged ball bearings—there are no rubbing surfaces to grind and wear.

The Yuba Ball Tread Tractor extracts from a gallon of distillate either an extra furrow, or an inch or two more depth in plowing.

It is mechanically perfect; so sturdily built that stoppages are few. Economy in your production requires a Yuba on the job. The government requires food, more food, and you demand power, more power to produce it—that's when you need the Yuba.

Have you the Yuba catalogue?

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Corn Not Filling

My corn did not fill well this year. I dusted with arsenate of lead to keep out corn ear worm. Would that affect the pollination? Also I noticed diabrotica on the green silks. Would it be possible for them to have eaten enough of the silks to prevent fertilizing?—Subscriber.

Without question over heavy powdering with any substance might prevent proper pollination. One reason for failure of corn crop in interior hotter valleys is the fact that when the corn is "silking out" extreme heat may destroy the silks so that pollination is impossible. If the dusting is very lightly done with a bellows or even through the meshes of some sheer cloth before the silking and then still more lightly some time after silk has appeared, it is probable there would be no injury from the powder. Bear in mind that while there are estimated to be 20,000,000 pollen grains on one tassel one of the grains must fall upon the receptive silks of which there are 500 to 1000 to the ear. As soon as the silk emerges from the husk it is ready to receive the pollen. If, at this critical period, the ear is covered with arsenate or any other substance pollination would be prevented. It may possibly be that the plant louse, or common aphis which has been so seriously infesting corn this year, prevents pollination, this because of sucking the sap from the silk and preventing it performing its functions. Of course any insect destruction of the silk would have equally disastrous results. These insects may possibly be reached by the earlier dusting recommended.

Aphis on Corn

Garden corn is seriously infested with aphis. Is it possible to control it economically?—Subscriber.

Aphis is easily killed, strong soapsuds being sufficient. Use one pound whale oil soap to six or eight gallons of water. A little kerosene added, if thoroughly mixed, increases the efficiency. Apply with hand spray pump directly on worst infestations. However aphis increases so fast that another spraying will probably be necessary within a few days. If preferred, nicotine sulphate, 40 per cent strength, one pound to 100 gallons of water, may be used as spray.

Kentucky Wonders Mildewing

Kentucky Wonder beans planted in adobe soil are mildewing badly, do not grow, blossoming very feebly and setting few pods. Beans were grown on this same ground for the two preceding years and were husky bearers till frost.—Subscriber, Los Angeles.

Mildew has been very general this year; the weather has been exceptionally favorable to its development and not favorable to control by the use of sulphur. Dry flowers of sulphur scattered over beans, grape vines, or any crop which is seriously affected, if given a few hot days, will usually cause a condition which prevents development.

Speed of Airplanes

Please tell me what the maximum and minimum speed of an airplane is. —Subscriber, Tulare.

This is a question on which we can get no very definite information. The recent issue of the World Almanac gives the maximum record secured last year as about 110 miles per hour. Accounts of the work of the new Liberty Motor assert that it will guarantee a speed of practically 144 miles per hour. As to minimum speed we are able to find no record. In fact, the speed varies so much according to weight of the machine, air currents and other factors that these conditions would have to be known in order to give a definite answer. However, we know of one machine which it was asserted required a speed of 70 miles before it would lift itself from the ground.

"Plugging Trees"

I notice on page 413 in your issue of October 29, 1914, "Easy Scale Killer Again." As the many human infections have come under the science of toxicology with gratifying results, why should not the same apply to our groves? I would be pleased to know if the treatment has been followed up to ascertain if the results have been satisfactory. If this cyanide treatment did the work then, as stated, there should be no question at this time of its success or failure, as it would be within the reach of the smallest as well as the larger ranchers. This seemed to have been under investigation by the Stanford University on September 3 of that year.—Subscriber.

The article referred to was a reprint of a communication from Professor Fernando Sanford of Stanford University to "Science", an Eastern scientific publication. We have seen nothing more regarding it in the public press and only a few months ago saw Prof. Sanford. Prof. Sanford remarked that nothing further had been accomplished along this line. As a rule orchardists do not believe it is possible to accomplish anything by this process. In a word, Prof. Sanford's plan, which, we may add, was at one time attractive in the minds of some, was to bore a hole to the heart of the tree, fill with cyanide or other toxic substance, plug up the hole and allow absorption by the sap of the tree. This poisoned sap was supposed then to cause death of any insect securing sustenance from the tree. Prof. Sanford referred to having tried this method on a Spanish broom infested with cottony cushion scale. He reported: "In February this year when the broom was thickly covered with scale I bored a three-eighths inch hole into the trunk to a depth of three inches, filled hole nearly full with crystals of potassic cyanide and plugged up. In two days the scale began to fall from the tree and in a few days all appeared dead."

Gophers

What is the best way to get rid of pocket gophers? Have tried several times with poison without much effect. — Subscriber, Ruth, Trinity County.

There is an article on another page of this issue showing the method of one of the Cultivator subscribers, that is, the use of gas from the exhaust of an automobile. That method has been found satisfactory by some. To our notion the best method is the trap, but there are traps and traps. Some prefer the box trap; for us, we prefer the old-fashioned one made of wire, a loop coming over the top with two prongs which when released pin the gohper against this loop. But whatever trap is chosen, be sure it is of good steel and has strength to hold and kill the gopher. Where poison is used, whether it be in raisins, potatoes or apples, we think best results are secured by inserting far into the runway and then closing the opening.

Dodder in Alfalfa

Please tell me how to eradicate so-called love weed in alfalfa. Will one lone string of this weed start new growth? Will winter kill it? Will it eventually kill field of alfalfa if left to grow?—Subscriber, Fresno.

Love weed, or dodder, is a serious pest, one of its worst features being that its seed is much like that of ordinary alfalfa, though smaller, so that a field that is entirely free from it may have it introduced. Therefore the first step is to secure seed absolutely free from it. The seed germinates in the soil and the slender yellowish vine grows and soon attaches itself to the growing alfalfa. Its connection with the ground is then severed, and from its first stalk it spreads to others until the one vine may cover a large spot or patch in the field. If the field is very generally infested it may be best to plow and raise hoed or cultivated crops until the seed of the pest has been entirely eradicated. If only in occasional spots, mowing with scythe and allowing the hay to become very dry, then sprinkling with kerosene and burning may eradicate the pest. If it begins growing again in a short time it may be controlled by the use of the blow torch, similar to, but usually larger than, that employed by the tinner in heating his iron. One should use care in mowing and hauling hay which is infested with dodder, for it is spread to other sections readily in this way. Even animals tramping through infested fields carry it from place to place. Do not use manure from horses fed infested hay on alfalfa field. It is probable that the "one long string" would not become attached to the alfalfa plant, but it might drop seed which would spread another infestation. There is no relief to be had from any winter killing, for the seeds perpetuate the species, in fact, the pest is even worse in some Eastern alfalfa sections than in California.

Quince Dropping

Would like to know why my quince tree leafs out nicely and sets fruit, but after the fruit is the size of a walnut it drops off. The tender branches turn yellow and the edges of the leaves turn brown.—Subscriber, Lemon Grove.

There is evidently something wrong with the root system. The trees will do well during the favorable season of the year but after that a weak or injured root system does not supply the needed nourishment. This is a theory based on the fact that injury to the root system is invariably shown in the top or ends of the branches of the plant first. If you had given some local conditions it is possible a different explanation would be given.—J. W. M.

Why Don't They Stop the Candy?

We read with lengthening faces your story of sugar situation and weigh out the daily dole in obedience to our country's mandate. But do tell us, if you know, why don't they stop the candy? Surely the candy habit is useless and generally undermining to body and mind. Why not save for necessary food in regular meals the sugar that goes into candy? I have with me one who has already lost a hand (in the Mexican troubles) and who declares he would cheerfully face the common foe again to finish in earth or air, but when he has to eat

his mush without sugar to sustain the body fires through his long day in the fields he growls that the thought of the foolish candy gets his goat.—Subscriber, Freestone.

Red Ants

Would like to know a way to get rid of red ants. Our cupboard is full of them.—Subscriber, Watsonville.

Insect powder or almost any of the ant exterminators that are on the market will drive them out of the house, but to prevent them coming back you must find the ant hills outside and destroy the whole brood. This can be done by pouring plenty of boiling water on the ant hill or punch several holes in the hill and pour half an ounce of bisulphide of carbon in each hole and cover it up tight with paper. This will smother them out. Keep fire away from the carbon bisulphide for it is combustible.—W. P.

Farm Tractors Gaining in Popularity

EVIDENCE of the growing popularity of tractors on farms is shown by reports made by more than 600 tractor owners in the corn belt, nine out of every ten reporting their investment in a tractor had proved profitable. These data were obtained in the summer and fall of 1907 and in the spring of 1918 on representative Illinois farms by specialists of the United States department of agriculture in order to determine just what conditions justified the purchase of a tractor in that section. Experienced tractor owners who made reports stated that tractors will prove profitable on most corn belt farms of 180 acres or more, while in their opinion they should not be expected to do so on farms of much less than 130 acres. The report of the investigators, published as Farmers' Bulletin 963, states that while the figures were obtained in only one state, they are applicable throughout the corn belt and that the prospective tractor purchaser may reasonably count upon equaling the average performances reported in the study.

The Tractor's Principal Advantages

Nearly three-fourths (71 per cent) of those who reported owned tractors capable of pulling three plows. Eleven per cent recommended two-plow machines, while 13 per cent advocated the use of four plows. In answer to the question "What do you find to be the principal advantages of a tractor for farm work?" the answers indicated that its ability to do heavy work and do it quickly, thus covering the desired acreage within the proper season, was considered the principal advantage. The saving of man power and the doing away with hired help, enabling a man to farm a larger acreage and thus increase the crops he can raise, was next in importance. The ability to plow to a good depth, especially in hot weather, was also emphasized.

Under disadvantages the difficulty of efficient operation was the principal point, and this fact should be kept in mind by everyone who considers the purchase of a tractor. In this connection tractor owners should take a course of training under competent instructors in this line, as the results of such a course usually amply justify the time and expense involved. Packing of the ground when damp was mentioned by several owners as a disadvantage, but not as frequently as was the case when more of the older and heavier machines were in use. The expense, delays, and inability to use the tractor for many kinds of work for which horses could be used were disadvantages mentioned by several owners.

Profiteering

What is profiteering?

Making unreasonable profits by unfair trade practices.

Has profiteering been abolished?

In many food lines it has been eliminated even in the face of actual shortage.

What has the United States Food Administration done to curb profiteering?

It has issued licenses to retail dealers in foods doing a business of $100,000 or more a year, and all wholesalers dealing in licensed commodities.

How does this check profiteering?

If the dealer does not follow instructions he loses his license and must stop his business.

Does this mean that wholesalers are under direct government control?

Yes.

Is the small retailer under government control?

No. He is under indirect control.

In what way?

If he charges profiteering prices he gets no more supplies from the wholesaler who is under direct control.

What has been the effect of this indirect control?

It has kept prices from soaring.

What rules help particularly to eliminate profiteering?

The rule which forbids the resale of food commodities within the same trade, without reasonable justification, and the rule prohibiting more than normal profits.

Stabilizing the Alfalfa Market

J. L. Farrar is continuing his work or organizing the alfalfa growers of the state and is now working in the San Joaquin Valley. One thing Mr. Farrar is doing is to inform growers as to what the association is not. At Fresno he said:

"The object of the association will be as much to protect the consumer from $35 hay as to protect the grower from $15 hay. The price approached $35 last winter when there was no regulation. The hay has also sold for $15 or lower in the field, sometimes less than it cost to produce, where the grower has not been protected with the right information, and where he has not had the money to hold and to bale with. Such cases are found in Fresno County. Again, individual growers have asked $25 for hay in the field, while the local associations have never asked more than $18 to $20 this year.

"In some sections of Fresno County investigated yesterday, it was found the cost of a ton of stacked alfalfa under present conditions was $13. This price does not include $3.50 for baling and $3 for freight, which would be required to lay it down in the cities.

THE SOLDIER'S CHANCES

Great as the danger and large as the losses in the aggregate, the individual soldier has plenty of chances of coming out of the war unscathed, or at least not badly injured.

Based on the mortality statistics of the allied armies, a soldier's chances are as follows:

Twenty-nine chances of coming home to one chance of being killed.

Forty-nine chances of recovering from wounds to one chance of dying from them.

One chance in 500 of losing a limb.

Will live five years longer because of physical training, is freer from disease in the army than in civil life, and has better medical care at the front than at home.

In other wars from 10 to 15 men died from disease to one from bullets; in this war one man dies from disease to every ten from bullets.

For those of our fighting men who do not escape scatheless, the government under the soldier and sailor insurance law gives protection to the wounded and their dependents and to the families and dependents of those who make the supreme sacrifice for their country.

VALUE OF ONE TON OF GARBAGE

Studies of garbage utilization by the food administration show that waste food products from American tables and kitchens are by no means worthless. On the contrary, garbage properly handled is a source of many useful and valuable products.

One ton of average garbage will yield sufficient fertilizing elements to replace the nitrogen and potash removed from the soil by eight bushels of wheat. It contains sufficient "fatty acid" for the manufacture of 100 12-ounce cakes of soap or for the explosive charge, as nitroglycerine, of 14 75 millimeter shells. When fed to hogs under suitable conditions a ton of garbage will produce 100 pounds of good, firm, first quality pork.

DAVENPORT'S
Riding Bean Harvester

Our Davenport Two-row Riding Bean Harvester or Sled is the ideal tool for harvesting bean crops planted between tree rows. It is strongly braced, well constructed with two long steel blades, cuts and windrows two rows at a time.

The International 8-16
A Handy Tractor

A FEW minutes in the seat of an **International 8-16** gives you a new idea of the ease and comfort of doing farm work with a kerosene tractor. All the controls are right at hand—spark and throttle controls just under the steering wheel; clutch and brake operated by foot pedals; speed changing levers just where your hand falls on them—everything as handy as on an automobile.

International 8-16 has one reverse and three forward speeds: 1¾ and 2½ miles per hour for plowing, disking and other field work, and 4 miles per hour for road work and when traveling from one job to another.

You will like this tractor when you see it. When you run it you will like it better. When you find out how light your bills are for kerosene and for general upkeep you will like it best of all. Go to the dealer soon and see it or write us for information because it looks as though the demand for **International 8-16** tractors is going to be much heavier than we expected and we shall have to fill orders in their turn.

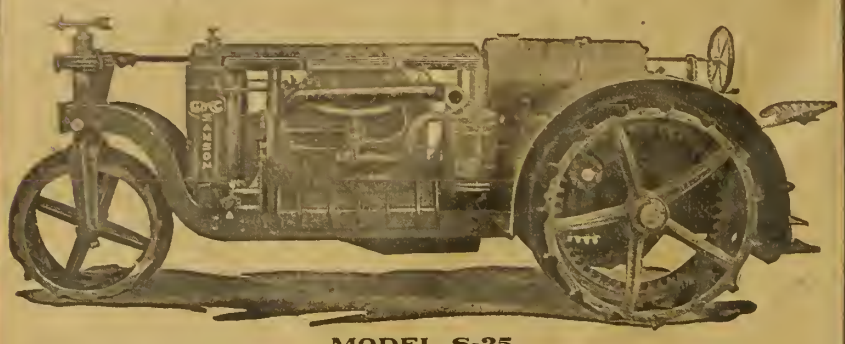
YOUR PROBLEM IS SOLVED

When You Buy a



MODEL S-25

SAMSON SIEVE-GRIP TRACTOR

GMC TRACTORS GMC TRACTORS

10 H P on the Draw Bar—25 H P on the Pulley

The Samson Sieve-Grip Tractor embodies all the features which years of painstaking effort and experience have approved. It is not an experiment. It is a demonstrated success of years' standing. Its enthusiastic owners are numbered among nearly all civilized nations on the globe.

In construction, it is very simple. In strength, all that its name implies. Built to meet the most exacting demands, day in and day out.

Its Sieve-Grip Wheels, skeleton-like in construction, give greatest traction with least weight. They do not slip. They do not pack the soil. They assist cultivation.

Its Nodust Moisto-Rizer cleanses all air entering carburetor and crank case vent. All working parts of the motor are protected from dust and grit.

Its Lubricated Roller Pinions reduce friction to a minimum. They deliver maximum power to the draw bar.

Its ball and disc type Governor assures simplicity of operation and prevents racing of the motor. Adjustment, made from the driver's seat, secures any desired set speed regardless of load, to the tractor's maximum capacity.

We court the most rigid investigation.

It will be our pleasure to give you a demonstration at any time, without obligation on your part.

Ask an owner or write us for information.

Northern California Notes

Written for California Cultivator by W. S. Guilford

THERE is promise of a big tonnage of rice in the Sacramento Valley this year. This is almost clear gain to the food supply of the nation as compared to conditions which obtained before the rice growing was started. Most of the land on which rice is now being planted was used only for pasture and rented for from 25 cents to 50 cents per acre. Now it is producing from 25 to 80 and 90 sacks of rice per acre.

There has been some difficulty in water delivery, as there always is on any irrigation system, but taken as a whole the rice crop looks fine.

Water grass and other weeds are in evidence everywhere but these are being taken out to the extent that labor is available for this work. The Mexican labor importation is to be used on this work.

Much attention is being given to the growing of the early maturing varieties of rice. A considerable part of the acreage is planted to these this year and it will be increased in 1919.

Labor Affairs

Good work is being done by the state council of defense labor bureau of which Alden Anderson is chairman and J. P. Dargitz special representative. A movement is on foot to bring in a considerable number of Mexicans for work in the rice and fruit harvest.

The Woman's Land Army is doing very effective and satisfactory work in the fruit harvest.

An effort is being made to have a standard wage set for common farm labor and the various classes of skilled farm labor. This will be a big benefit in that it should prevent the movement of laborers from one section to another because of rumors of higher wages being paid. It is proposed that this wage scale be set at prices which will be fair both to employes and employer.

By-Product Prices

There is big demand for grain straw and grain stubble and high prices are being paid. A common price for barley and wheat stubble is $1.00 per acre, and prices of $2.00 and $3.00 are being asked.

It is reported that rice stubble has been contracted at $2.50 per acre without the straw which will be sold separately.

Saving Straw

A movement to conserve grain and rice straw is being taken up by the Glenn County council of defense and the state council of defense. W. D. de Egilbert of Willows is in charge of the work. Cooperation between the grower, the baler and the stockmen who will feed the straw is being arranged.

The Iron Canyon Project

The great need of the Iron Canyon project for conserving flood waters at the head of the Sacramento Valley for use in growing crops is more manifest this year than for some time. All of the land that is not being irrigated is dry, very dry. The production on thousands of acres of good land could be multiplied by the use of the water which now goes to waste.

An Addition for Orland

A new reservoir to store more of the run-off of Stony Creek is being discussed as a war measure. An addition of 20,000 to 40,000 acres to the Orland project, which additional storage could provide for, would make a big increase in crops in that section. The Orland project is recognized by many authorities as the most successful in America.

Red Spider

The ravages of red spider increase as the season progresses. Many trees have already been defoliated, and in other orchards it is kept in check only by continuous spraying. If spraying is delayed for a couple of weeks it gets such a start that it is difficult to control it. One of the best investments in our prune orchards this year is atomic sulphur and the spraying crew.

Farm Bookkeeping

The income tax has made farm bookkeeping a greater necessity than ever before. Many farmers, the majority in fact, have been content to have the income exceed the expenses and let it go at that. Now the income tax inspector finds it easy to ascertain the amount of money received for crops, and it is up to the producer to show what it cost to grow them. And to do this it is absolutely necessary to have some kind of books to show. In Glenn County one expert bookkeeper who has made a careful study of the income tax finds a greater demand for his services for keeping farm books than he is able to supply. He is a "common sense" kind of bookkeeping, who lays out a simple system, and in a few hours time every month is able to do everything necessary in the way of posting, etc.

Dry Trees

Many trees show the effect of drouth as to be expected after two very dry years. In fact some trees show it even where they are being watered frequently. This is particularly true where the soil is heavy. Frequent light waterings—where the moisture dries up rapidly — do not penetrate the soil to sufficient depth to do much good. There was a case in point here not long ago. A tree was drying up at the top and showed in every way that something serious was wrong with it. And this in spite of the fact that it was being watered from a city water system frequently. The owner was afraid something was working at the roots of the tree, some mysterious bug or germ that would have to be dug out. An examination showed that the water has been penetrating only a foot or so into the soil and that a large percentage of the tree's roots were in "powder dry" soil. The condition was remedied by making deep trenches in circles around the tree and letting a small stream of water run in them for many days until the soil was thoroughly saturated to a depth of four or five feet.

FRESNO FAIR

Secretary and Manager C. G. Eberhart is mailing copies of the premium list of the Fresno County Agricultural Fair. The fair will be held October 1-5. The Fresno fair grounds consists of 100 acres of land directly opposite the park and is connected by two car lines. The grounds are now well fitted with buildings which will be supplemented with large tents, and every effort is being made to provide entertainment as well as instruction for the usual large attendance.

Not "our bit" to the call, but our best and our all.

PROTECTION OF NEWLY PLACED CONCRETE

All newly placed concrete work must be protected against the elements and against injury from other outside causes until the concrete has thoroughly hardened. In most cases this protection need be no other than a covering of some sort which will prevent rain from falling directly on the exposed concrete surface.

In seasons of extreme heat it is necessary to protect the concrete against direct rays of the sun and direct exposure to the heat. Such exposure will cause the water in the concrete mixture to dry out before the concrete has had an opportunity to harden, and thus an inferior concrete will be produced, particularly at the surface. The best way to protect the concrete against such injury is to keep it covered with water until it has hardened. In the case of pavements or floors this is easily accomplished by building little dams of clay or other suitable material across the surface of the concrete and keeping the enclosed spaces filled with water for several days, or until complete hardening has been accomplished. In other cases where this method is not practicable the concrete may be protected by keeping the air in the room in which the concrete is located saturated with moisture either by means of escaping steam or a fine spray of water.

The presence of water or moisture in the atmosphere will not in any way injure the concrete either before it has hardened or after. Before hardening has set in the presence of moisture in the air is exceedingly beneficial to the complete and thorough hardening of the concrete. After the hardening has been accomplished the presence of moisture in the air will not affect it.

The application of paint or other protective coatings to concrete work before it has hardened will cause it serious injury. This injury arises from the fact that the hardening process will be materially retarded by the admixture of any substance not properly a part of the concrete mixture. The concrete at the surface will also be materially weakened by this application and in all probability will peel off after the concrete below the surface has hardened. After the hardening process has been completed no protective coatings of paint or other material are necessary.

PROTECT THE SCREECH OWL

A bird of which little is known, except by the initiated, yet one that is far from uncommon in most of the wooded sections of the United States, is the much maligned screech owl, says Boys' Life, the Boy Scouts' magazine for July. The sweeping manner in which the farmer and sportsman condemn it as well as all other birds of prey, because of the offenses of a few, aptly exemplifies the old adage that "a little knowledge is a dangerous thing." Did the farmer but know it, he is aiding in the extermination of one of his best friends when he kills, as he almost invariably will kill when he gets the opportunity, one of these little Raptores; for the screech owl not only does not help himself to the poultry but will rid the farm to a large extent of many of its enemies if he is allowed to make his home in the vicinity.

With the exception of the burrowing owl, it feeds more extensively on insects than any other species. It is also a diligent mouser. Of the 204 stomachs examined, birds were found in only about 15 per cent, and fully one-third of those were English sparrows. Among insects, grasshoppers, crickets, beetles, and cutworms are most often eaten. Meadow mice, white-footed mice, and house mice are the mammals most often taken, while chipmunks, wood rats, flying squirrels and moles are less frequently found. As nearly three-fourths of the owl's food consists of injurious mammals and insects and only about one-seventh of birds (a large proportion of which are English sparrows) this little owl should be carefully protected.

INTERNATIONAL SOIL PRODUCTS EXPOSITION

The International Soil Products Exposition will this year be held at Kansas City, Missouri, October 16-26. Exhibits will be shown from Canada and Mexico as well as from all parts of the United States. Live stock and dairy industries will be featured. This exposition will be the thirteenth annual.

June reports from Greece indicate that the currant crop will be heavy; old stock on hand amounts to 40,000 tons.

KILLING GOPHERS

Some years ago the Cultivator recommended as excellent destroyer of gophers and squirrels, the exhaust from the automobile. We do not think the value of this method has been fully appreciated. Now comes a Los Angeles County subscriber, E. M. Morgan, with a photo showing how he uses this method at nominal expense. The connecting hose which the boy is holding is simply an old bicycle tire cut and put over the exhaust. The exhaust is made more deadly by the use of cylinder oil, a quantity of which is squirted into the intake. As a matter of fact Mr. Morgan says the oil which he uses is the "worn out" oil which has been already used in the machine. In lieu of the bicycle tire any old hose my be used which will connect up the exhaust with the hole. Note the smoke arising from the ground to the left of the opening in which the tube has been inserted. This is evidence of the effect of this work.

Killing Gophers

Exhausting from auto through old bicycle tire finishes the gophers. Photo by E. N. Morgan.

Love blinds some men and it makes lots of others too near-sighted for military service.

RURAL FIRE CONTROL

The Agricultural Experiment Station, University of California, Berkeley, is mailing circular 202, "County Organization for Rural Fire Control." It is written by Woodbridge Metcalf. As justification for the publication the author referred to the fact that the loss of food stuffs in field and fire fighting last year in this state aggregated $750,000. There are from fifteen to twenty thousand acres annually destroyed within California boundaries. Besides that thousands of acres of range and tons of hay are annually lost by fire. The circular touches upon essentials of county organization, local fire companies, duties of fire chief, district fire plan, and fire fighting equipment, giving specifications for the building of a trailer and for all parts of the fire fighting equipment, then an outline of the equipment in the trailer. Then at some length instructions are given as to the use of fire extinguishers and other fire fighting equipment.

CITIES MUST HELP FARMERS

In any American city it may come to pass that men who know how to chop wood or pick cotton or harvest wheat will have to close their offices and stores during the periods of seasonal strain and come out and help the farmers. All the other countries at war have done that and we must do it if the need appears.—Clarence Ousley, Assistant Secretary of Agriculture.

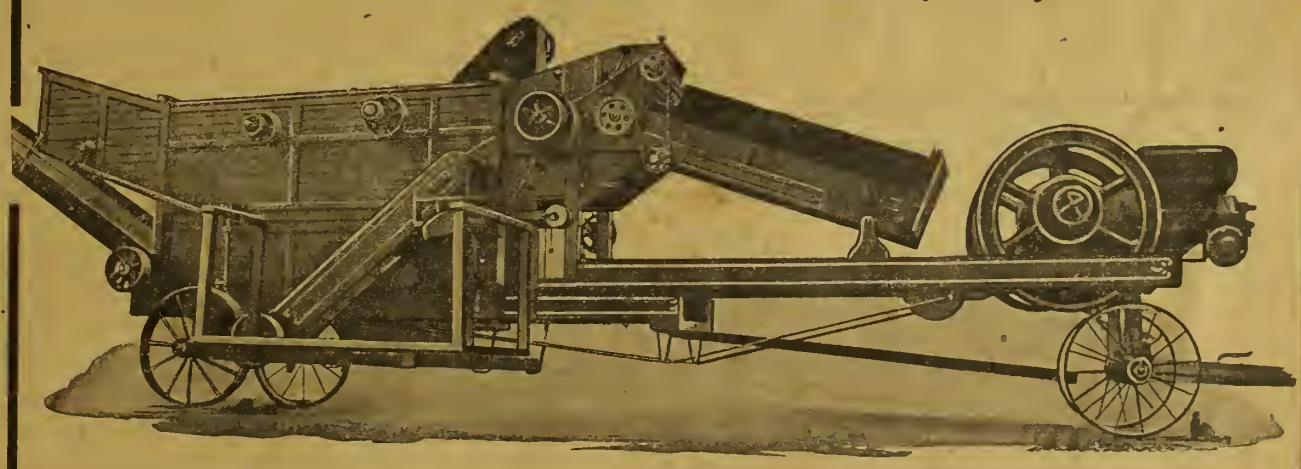
ALIENS

There are enemy aliens and there are native aliens. The American who does not do his part toward winning the war, who neither fights nor works nor lends for victory is as much an alien to America's purposes and America's cause as the rankest Prussian interned in this country.

This is a war of peoples as well as of nations, and each individual has a place and a duty.

New Labor Saving Bean Threshers

Seven men can operate the Junior No. 1, equipped with sacking platform for threshing from windrows—the most successful and economical Bean Thresher offered to California growers, threshing every variety.



For 22 years we have been making Bean Threshers in Ventura County.
Our experience in hundreds of bean fields with the many machines we have built and sold has given us unlimited opportunity to observe and build bean threshers that meet every requirement.

To meet the demand for a bean thresher that could be operated with a minimum of labor, we have produced the Junior Nos. 1 and 2, two sizes of our special models that can be drawn across the field by a small tractor or horse power and operated by gas engine mounted as shown here. This machine can be operated as a stationary machine also. Seven men can operate this machine successfully, thereby SAVING THE EXPENSE OF HAULING THE BEANS TO THE MACHINE. It is built on the same principles as our larger machines and works just as satisfactorily, threshing every variety of beans.

Write us for information about BEAN THRESHING MACHINERY, telling us your acreage, what kind of beans you have, what horsepower engine or tractor you have, what kind of engine and tractor, and the amount per day you would like to thresh and we will furnish you, free, information as to your most economical and satisfactory requirements. Do not waste a valuable bean crop by trying to thresh beans with a machine intended to do other work. It will pay you to investigate our line and to buy without depending upon freight shipments from the East and where parts can be obtained quickly.

Lord Rhondda (David A. Thomas), food controlier of Great Britain, and a noted Hereford breeder, died at his home in Monmouthshire, England, July 3, his death being due to overwork in the service of his country.

The Jersey Bulletin comments on the record made by the Ferndale Cow Testing Association of this state, referring to the fact that nine years is a long time in the history of cow testing associations. There were 64 herds tested last year.

The U. S. department of agriculture has begun an experiment to determine whether prepotency in production is the result of line breeding or outcrossing. It is expected that this experiment will occupy at least 25 years. Cattle of each of the common dairy breeds will be used and the first animal to be selected is the Guernsey bull, Barrington May King 19312, purchased from Sunnybrook Farm owned by Charles D. Cleveland, Eatontown, New Jersey.

The Wool Clip in California

AT A CONFERENCE of the government officials and representatives of prominent wool growers held at Washington, D. C. last April, it was agreed to place all the wool in the government's hands at a price prevailing July 30, 1918. The wool was to be handled through the usual licensed dealers, the latter transferring the same from the grower to the quartermaster general's department and being allowed a definite commission for their services.

A number of distributing centers were named. However, for some reason, Portland was the only western distributing center named.

On the other hand, special regulations have lately been made for handling the wool clip for California, as issued by Lewis Penwell, chief of wool division of war industries board, Washington, D. C.:

"There is a considerable saving in freight rates on baled wool over wool in bags and heretofore it has only been necessary to scour and carbonize many California wools. To do this it has been necessary in the past to have these wools assembled at various points in California, there to be blended and baled in the grease or else scoured, carbonized and shipped East for sale. After the wool has arrived at the Eastern center in the neighborhood of the mills, it is inspected by the representatives of the mills and purchased with reference to the particular needs of the mill.

The quartermaster general's department, which this year will be the buyer of practically all California wools, wishes to have them follow as nearly as possible the channels heretofore taken, and make its purchase after they have arrived at the Eastern centers of distribution where they can be inspected by the quartermaster general's department and the representatives of the mills, and be distributed with reference to the particular class of goods which is being manufactured by the mills. Accordingly for the foregoing reasons, there will be no approved distributing center established in California.

However, in order to leave wool enough in the state to amply take care of the needs of all the mills in the state, and in order to utilize the very efficient carbonizing and scouring plants of the state to their fuliest capacity and to give the growers having wools which should be carbonized an opportunity to dispose of their clips locally, should they desire to do so, dealers approved by the board will be permitted, under government regulations to buy California wools at a price sufficiently below the established government price to enable the dealer to make a net profit of not to exceed one cent per pound for buying and assembling these wools. This will be done in order to have them blended, baled, scoured, carbonized and baled for shipment, either to local mills or to approved Eastern distributing centers, and final sale to the government.

The price the government has fixed is on a basis of delivery at the Atlantic seaboard, and the grower will have to pay the freight to the Atlantic seaboard whether he consigns his wool or sells it. Therefore, the dealer in buying and in order to make a net profit of one cent per pound, will of course have to pay the grower the government price, less the one cent, less freight and baling expense, less the cost of scouring and carbonizing, —if it must be scoured and carbonized,—and less the estimated interest at the rate of six per cent on the investment until the wool arrives at the Atlantic seaboard.

The books of approved dealers shall be at all times open to government inspection, and if at the end of the season's business it is found that the net profits exceed one cent per pound on the season's business, then such excess profit shall be disposed of as the government decides.

No grower is required to sell unless he wishes to do so, and that at all times he has the privilege of consigning his wool to an approved dealer in an approved distributing center, at which point the wool will be appraised and purchased by the government, and the full government price paid the grower, with no deduction whatever for commissions or middlemen's profits.

Growers of small clips who desire to do so will be allowed to pool their clips in quantities of not less than minimum carloads and consign the wools so pooled as one account to any approved dealer in any approved distributing center. Growers who desire to consign their wool to San Francisco, Stockton, or other usual concentration points in California, may consign it to any approved dealer, whose commission shall be one-half cent per pound to be paid to the grower.

These regulations apply to California wool only. Wools from states to the East of California will be required to be shipped East.

Dealers wishing to operate under these special regulations should apply to the undersigned for a formal permit to operate."

Professor Robert F. Miller, sheep and wool specialist of the University Farm, Davis, has been appointed as California's representative in the wool division of the war industries board by the chief of the wool division, Lewis Penwell, Washington, D. C. and for any further information regarding the disposal of the present wool clip, growers should communicate with Professor Miller at Davis.

HOW TO PROTECT COWS FROM FLIES

It is questionable if it is worth while to spray cows to protect them from flies. The continued use of any spray gums up the skin until the animal suffers more from this than from the flies, unless she is washed once or twice each week. The amount of milk produced is not appreciably increased by spraying cows, but the greater comfort in milking may be sufficient to pay for the trouble. It is generally more convenient and more satisfactory to purchase some of the prepared fly repellents than to get a formula filled. C. H. Eckles of the University of Missouri college of agriculture mentions that two formulas that have been used with some success are:

Fish oil one gallon, oil of pine tar two ounces, oil of pennyroyal two ounces, kerosene one-half pint.

Fish oil one quart, petroleum one quart, carbolic acid one ounce.

These mixtures, like the ready mix-

ed ones, are applied most advantageously with a hand spray pump. The spray is generally applied once a day, just before milking in the evening. If flies cause sores on the udder, the repellent may be applied to them.

Veterinary

Lame Pigs

Would like to ask advice regarding my three months old pigs that are getting lame. It seems to be in the hind legs just below the hock. Am feeding them skim milk, bran and green alfalfa. What is the remedy?—Subscriber, Van Nuys.

It may be rheumatism. Get salicylate of soda and give each one half a teaspoon of it in the sour milk once a day for a week or two.

Grub in Head

I am raising 100 orphan lambs that are now over three months old. Have had no trouble with them until recently when they developed a cough and running at the nose, at first only a few of them, but now most of them are affected. Fed them milk for over two months and they have good range on bur clover and filaree. They are in a corral at night with access to a good warm shed. They have plenty of fresh water and salt. The corral is a little dusty now but the trouble started before the dust appeared. The discharge at the nose is quite thick.—Subscriber, Chino.

It may be grub in the head. Examine the head above the eyes and if you find some soft spots open them with the point of a knife and remove the grub. It may be due to lung worms, but is a little early in the season for that. If it is you may be able to detect some of the dead worms in the discharge from the nose. In that case turpentine is the best remedy. Give a teaspoon of the turpentine in four or five times as much linseed oil once a day for a week.

Mange

Would like to know a remedy for dog mange. Our pet dog is affected with it and we have tried dip and mange cure but nothing seems to help.—Subscriber, Watsonville.

Mange is due to a small mite that burrows in the skin. There are several good remedies for it such as sulphur ointment, a solution of chloride of zinc; one part of the zinc to 200 parts of water, or probably the best remedy is to apply a thin engine oil all over the dog. Repeat this in a few days and in another week wash him with plenty of soap and water.

Sore Eyes

I have a young mare that has trouble with her eyes every summer. The lids seem swollen and sore and water runs from the eyes. Can you tell me what the trouble is and what I shall do for it?—Subscriber, Shafter.

If she is running out in pasture it may be due to a weed that she comes in contact with. In that case it would only be necessary to keep her in and bathe the eyes with warm water that has a teaspoon of borax to the pint. Or it may be due to a disease called periodical opthalmia. In that case you would have to add to the above remedy an internal treatment. Give her once a day a handful of epsom salts and common salt, two parts of the epsom to one of the common salt. Continue this for a week.

Indigestion

Would like to have advice regarding a sick calf. The calf has lost its voice and when lying down the food runs out its nose. When bringing up its cud the food runs out its mouth as well.—Subscriber, Moorpark.

It is caused by indigestion or sour stomach. Get a pint of raw linseed oil and add two ounces of turpentine to it. Shake well and divide into five doses. Give one dose once a day. If it seems necessary repeat this in a week or two.

Rupture

I have a heifer calf eight weeks old and the navel seems to pouch down. Is it possible that this is a rupture, and what is the remedy?—Subscriber.

It may be a rupture and will probably disappear without help, but if it does not by the time it is six months old, then turn the calf on its back, scrub the parts clean and reduce the rupture, then pass a skewer through the sack and tie a cord around it. Be sure the skewer is clean by dipping it in a strong solution of carbolic acid. Feed the calf lightly for two weeks, and at the end of that time if the skewer has not dropped off remove it and wash the parts well with soap and water with some carbolic acid in it.

THE GERMAN DOCKS

The taking over by the United States of the title and possession of the docks, piers, wharves, and other shipping property on the Hudson River, owned by the German steamship companies, the North German Lloyd and the Hamburg corporations, is greeted with universal approval by the American people. The property is to be retained by the government and not turned back to its former owners at the close of the war.

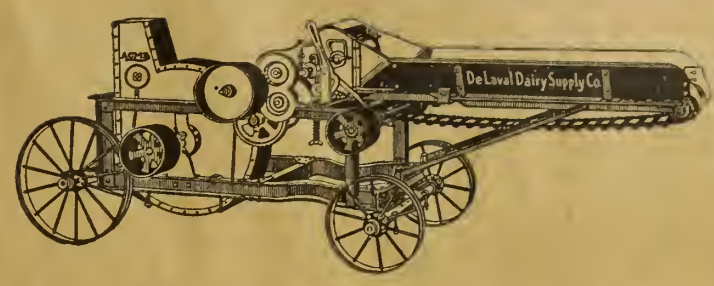
Purchasers of Liberty Loan Bonds and War Savings Stamps, who supply the money used for this purpose, may feel especial gratification. These docks and piers and wharves are strategic points of great importance and value, and it is intolerable that they should remain in enemy hands, or that they should ever revert to German ownership. German commerce has been shown to have been so indissolubly bound up with, and so much a part of German militarism, that it is just and right that it should suffer all the penalties of war.

NOT SO MEAN

"Did the bride's father give her away?"

"No; on the contrary, he told the bridegroom she would make a very economical wife."

ACME



Feed Cutter and Silo Filler

Steel Frame Construction
Lawn Mower Type Knives

A CYCLONE SILO Will Save You Big Money On Your Feed Bill

If you are in the farming business to make money you must save as well as earn—a silo will save you its cost in the first year of its use. With a silo you can convert into first-class stock feed a lot of your product that you have wasted in the past—

The CYCLONE SILO

—is constructed to stand up under the most trying conditions. Flat iron bands encircle the CYCLONE (as illustrated) in such a way that it cannot possibly twist or warp out of shape—does not get smaller at top than bottom after usage. No guy wires to stumble over.

We, who make this silo, have been manufacturing wood tanks, wood stave pipe, etc., for use in all parts of the world for 25 years—we know our business and our guarantee that this silo is right means something.

Sugar Beet Tops and Lima Bean Straw Silage

By G. E. Bensel

SUGAR beet culture leaves, after the beet crop has been harvested, a by-product, the beet tops, which if properly siloed constitute an excellent feed for live stock. Considering an average yield of ten tons per acre, the weight of beet top ensilage produced per acre can be estimated at approximately three tons.

This valuable feed has not been sufficiently appreciated by our beet growers. The cost of siloing tops is comparatively slight, ranging under ordinary circumstances from $2.50 to $3.00 per ton. This cost includes the initial cost of excavating the silo, the value of the tops, straw and salt used, and the cost of hauling to the silo and filling.

By siloing the beet tops, they undergo chemical changes by which they are rendered more palatable and more digestible. A great deal of the feeding value of beet tops is lost by allowing them to lie scattered in the field where the stock is turned into them. The method of siloing used comes as near conserving all the value of the tops as it is at present possible to do. It allows little waste and softens the crowns so that the entire use of the tops is realized.

Chemical analysis of beet top silage shows that the necessary constituents for animal nutrition are present in about the same percentage as in corn silage and in other feeds. We recommend the pit silo where such is practical. The method of construction is very simple and inexpensive.

One ton of green beet tops requires about 48 cubic feet of silo capacity. The ends are left sloping, making excavation easy. The tops are firmly packed in the silo by driving through each time with the wagon, thus compacting all the lower layors.

The bottom should be covered with straw about six inches in depth and about the same depth is put over the top. The top is then covered with six inches of dirt which excludes air and moisture, thus keeping the tops in their original state of preservation.

The palatability is improved by scattering salt over six inch layer of tops. It is very important to compact the tops in order to secure the proper fermentation and breaking down process. The tops will settle about 30 per cent after one month of storage.

The best results are obtained by putting the tops in the silo promptly, not to exceed two days after they are topped. It is important to have the tops as free from dirt as possible and care should be taken in picking up the tops to shake off the dirt.

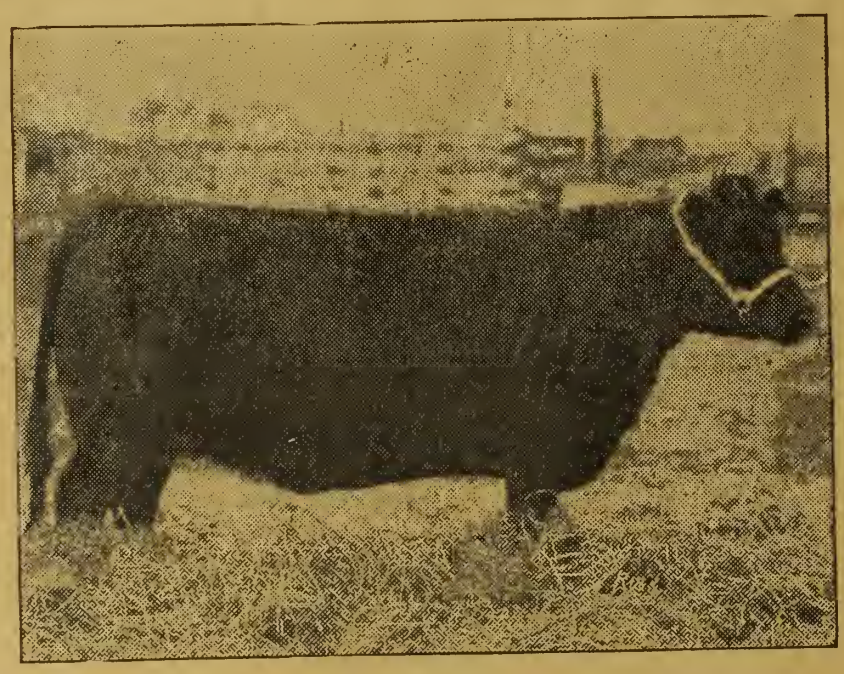
From four to six weeks are required before the silage is in good condition. During the process of fermentation the digestibility of the principal food constituents has increased in the ratio from 80 to 91. This means that 11 per cent more of the feeding elements will be assimilated by the animals during the feeding process as compared to the green tops. This is a very important feature because it is not the amount of feed but the portion the animal can digest, which is fattening.

In regard to the quantity of beet top ensilage to be fed to steers I would recommend about 30 pounds per head. Using this amount as a basis one acre of beet tops siloed, yielding three tons of tops per acre, will feed and fatten 1½ steers in 120 days.

In addition to the 30 pounds of beet top ensilage, in order to balance the ration, we should add about 20 pounds of bean straw and a small quantity of concentrated food, such as cotton seed meal, from two to four pounds per head per day.

Expressed in other words, each acre of sugar beets and each one and one-half of lima beans produce as a by-product, sufficient food to feed and fatten one and one-half steers in 120 days. The only feed the farmer has to purchase is from four to five sacks of concentrate in order to properly balance the ration.

I do not feel it necessary to make here a patriotic appeal, because judging from the way the farmers have responded to the third Liberty Loan, I am convinced that you fully realize your position and obligation in this great struggle for liberty. I simply wish to show the advantages to be derived by the better utilization of the by-products, beet tops and bean straw for feeding purposes; 10,000 acres of beet tops and 15,000 acres of bean straw will feed and fatten 15,000 steers and produce in the neighborhood of 3,000,000 pounds of beef, which is just another step toward successful and systematic farming.



A $4000 Aberdeen-Angus

Brookside Blackbird 36th was sold at the annual W. H. Cooper Aberdeen-Angus sale of J. Garett Tolan of Iowa.

CALIFORNIA SHEEP CLUBS

The agriculture clubs of California are assisting in curtailing one of the wastes in California agriculture. Each spring during the lambing season thousands of orphan and twin lambs are slaughtered because of the inability of the sheep men to care for this kind of stock.

Early in the spring of 1918 a number of boys in the Sacramento Valley were interested in the work of raising lambs on the bottle. High school lamb clubs were organized and given instruction in the care and feeding of this stock which is normally slaughtered and which, therefore, never reaches maturity. The proposition was presented to the boys as an opportunity for them to get started in the sheep business with practically no capital. The members of the various high school lamb clubs went to the shepherds of the larger flocks which were lambing along the foothills of the eastern side of Sacramento Valley and asked them not to slaughter the orphan lambs on certain days. On these specified mornings the boys would go by appointment to the flocks and take as many lambs as they felt they could adequately and properly take care of. These lambs were usually secured without cost to the boys, since this stock would have been slaughtered had they not been taken by outside parties. The boys returned home with their stock and cared for them to the best of their ability following instructions sent out by the University of California college of agriculture.

The experiment has been a success and the results obtained are gratifying and form a basis for much better work during the coming year. The results obtained this year will be used as a demonstration and undoubtedly many more boys can be interested in this same work next spring. Six sheep clubs were organized and the members of these clubs were able to successfully raise 376 lambs this season. These lambs are a distinct gain to the state since they would otherwise have been slaughtered and they not only increase the meat supply but also will increase the wool production of the state. In most cases these lambs will be kept and will form the foundation for probably 45 or 50 more flocks of sheep in California.

WOOL POOL FOR STANISLAUS

Farm Adviser Jungerman of Stanislaus County invites all those who have lots of wool to leave their names and amounts at his office. An endeavor will be made to pool all the different lots and make up a carload shipment direct to Portland, Oregon, which is the nearest government wool receiving station. A farm bureau committee will be appointed at the next directors' meeting August 7. Each grower will be allowed his proper apportionment according to grade and quality, the wool being graded by wool experts. At the next direcvtors' meeting of the farm bureau, a committee will be appointed to help handle the wool clip.

HOW A COW HELPED SHIPBUILDING

Frank Parker Stockbridge, in the World's Work for July, tells of the various methods by which Mr. Schwab is speeding up shipbuilding. Here is how a Jersey cow was used:

"How many ships are you going to get into the water this year?" Mr. Schwab asked Rear-Admiral F. T. Bowles, assistant general manager of

the emergency fleet corporation, in charge of construction at the Hog Island yards.

"Our program calls for 31, but we are going to try for 48 at least," was the reply.

"Make it 50 and I'll see that you get the best Jersey cow in America," said Mr. Schwab. The admiral has a dairy farm in Massachusetts. "I'm going to begin picking out that cow right away," said Admiral Bowles.

Hogs---Helpful Hints

C. M. VESTAL is author of Circular 201 issued by the agricultural experiment station, University of California. Its title is "Helpful Hints to Hog Raisers." Here are a few of the hints which show how a large fund of information is packed into a number of short paragraphs in the eight page circular.

On Feeding, Care and Management

Little capital is required to produce a few hogs and the profit comes quickly.

There is a place on every farm for at least one sow and her pigs, because there is waste feed that they will consume. Preventing waste and producing pork is doing double service.

Careful management and feeding of brood sows and pigs is the way in which the wise grower doubles his chances of a good profit in finished hogs.

Hogs are good scavengers but don't force them to prove it. Give them a chance to prove it.

Raise two crops of pigs a year. It is a common practice in Eastern and Central states. California conditions are more favorable than those of the East for this practice.

Use the best boar that you can secure.

Have the sows in gaining condition but not fat at breeding time.

Feed the pregnant sows well but don't get them too fat. Liberal feeding of alfalfa hay, alfalfa meal, or wheat bran, with some grain helps to prevent over-fatness, furnishes protein, saves grain, and keeps the bowels in good condition.

Plenty of exercise helps to prevent excessive fatness in brood sows, keeps the boar in good condition, and assures good growth in well-fed pigs. Arrange pens, feed troughs, and sleeping quarters so that some exercise must be taken. Hogs on pasture usually get plenty of exercise.

Provide clean, comfortable quarters for the brood sow, especially at farrowing time. Individual houses are cheap and handy to move about. (If you want plans write to the Agricultural Experiment Station, Berkeley, California.)

Arrange to have the sows farrow early. The early pigs usually have the advantage of a better market.

Give sows that are suckling pigs plenty of milk producing feed. The cheapest gains are made by young pigs.

Feeder pigs can usually be raised cheaper than they can be bought.

Make a creep or separate pen for the pigs that are about three weeks old. They are then ready to eat some solid feed. A mixture of ground grain and wheat middlings, made into a thin slop with skim milk is one of the best. Avoid barley hulls, oat hulls, bran and rough bulky feeds. Ground oats and barley are good if the hulls are sifted out. Do not over-feed but feed often, say three times a day, just what they will clean up.

Save the best gilts and breed them to a good pure bred boar. This is the best method of building up a good producing herd. Keep the sows that prove to be the most profitable producers.

Boar pigs which are intended for market should be castrated while they are small, usually before weaning. This is the easiest way and is best for the pigs.

Indian corn is the best fattening grain for hogs. Barley, milo, and kafir are 90 to 95 per cent as efficient as Indian corn. They all need supplementing with a protein feed.

Tankage, wheat middlings, cocoanut meal, linseed meal, soy beans, skim milk and buttermilk are some of the best protein supplements to use with barley, milo, corn and other low protein grains. Of the forage crops, alfalfa, clover, soy beans, cowpeas, and rape are the best for supplying protein.

Barley, wheat, rye, milo, kafir, and other small grains should be ground or rolled. Soaking serves the same purpose with barley, wheat, and rye, but is not so good with the sorghum grains.

Soaking ground grain is unnecessary. Fresh slops are usually safer than those which have stood for some time, especially in warm weather.

It doesn't pay to cook feed for hogs. In many cases the feeds are made less valuable. Potatoes and beans are, however, improved by cooking.

Pumpkins may be grown as an extra crop. They are fine for brood sows suckling fall litters.

Forage crops cheapen production. Alfalfa, clover, rape, soybeans, wheat, barley, and rye pastures are some of the good ones. Alfalfa ranks at the top.

Pasture crops give the pigs a good start but it takes grain to finish them.

Young growing pigs should never be forced to live on pasturage without grain. Give them at least two pounds of grain for each 100 pounds body weight.

Alfalfa pasture saves from 15 to 20 per cent of the grain for fattening hogs. It saves a great deal more for brood sows and young breeding stock.

THERE IS NO SUBSTITUTE FOR MILK AND BUTTER

Milk is one of the most important food sources the human race posesses. For the proper nourishment of the child it is absolutely indispensable and its use should be kept up in the diet as long as possible. Not only does it contain all of the essential food elements in the most available form for ready digestion, but the recent scientific discoveries show it to be especially rich in certain peculiar properties that alone render growth possible. This essential quality makes it also of special value in the sick room. In hospitals it has also been shown that the wounded recover more rapidly when they have milk.

For the purpose of stimulating growth, and especially in children, butter fat and other constituents of milk have no substitutes. Therefore, every parent owes to himself and to his family the duty of providing requisite amounts of milk, butter, cheese and other dairy products. During this last winter, when much agitation was had in some of the larger cities over the price of milk, which was advanced from two to three cents a quart by reason of the rapid rise in the cost of feed and labor, many families among the poor were found giving their children tea and coffee instead of milk. Such methods of feeding fail to nourish the child properly.

The widest possible publicity should be carried on through public channels to bring these essential facts to the attention of all mothers.

In spite of the shortage of milk in Germany, that country has at all hazards maintained the milk ration of the children and in the hospitals, even though to do so has meant that the adult population has had to forego largely its use. In a "safety first" health campaign it must be remembered that it should be "children first."

All roads of "service" lead to France.

REMEDY FOR STRINGY MILK

Stringy milk is caused by bacteria which enter the milk after it has been drawn from the cow. It is not caused by the feed or any abnormal condition of the cow. Milk affected in this way is not unhealthful, but it is certainly not appetizing. The bacteria which caused the trouble live in water ordinarily, and probably enter the milk from the cows' bodies, or from utensils. Where trouble arises from this condition the utensils, especially the strainer cloth, should be boiled. If this treatment does not eliminate the trouble, the fresh milk should be heated on the stove to a temperature of 150 degrees, then let stand 20 minutes and cooled as quickly as possible.

Production and self-denial are the guns that will get the Huns.

CALIFORNIA CHAMPION HAMPSHIRES

As good as the best and better than the rest. A boar or a sow pig sired by my great herd boar Director, and out of one of my choice sows will add prestige to your herd. I am booking orders now for the pigs of March and April farrow. Write now and place your order.

Toggenburg Milch Goats — Rae P. Williams, Federal Realty Building, Oakland, California.

THE CALIFORNIA LEGHORN CLUB

Friday evening, July 12, the California Leghorn Club met in Los Angeles to complete the organization begun at a previous meeting. By-laws were adopted but election of officers was postponed until a larger number could be present. The program of this club is ambitious. It aims at improvement and development of all varieties of Leghorns, as well as at better methods of feeding and management. If it is carried out it will give California what it has long needed, an organization which shall be a center for better poultry work in all directions. E. E. Emerson is temporary president and Mrs. E. B. Martin temporary secretary of the club.

KEEP ON HATCHING

A San Jose subscriber, Mrs. M. A. Warren, recommends continuing the hatch through the summer days. This for the purpose of securing later summer layers for next year. Mrs. Warren adds: "Am still hatching every egg. I get even now 90 per cent fertility and 90 per cent hatch of the fertiles. Of pullets hatched last August and September there are 75 per cent of them now laying. From tests I have made I think poultry people should hatch right up to December. This applies especially to eggs from last year's late Plymouth Rocks."

EFFECTIVE LICE KILLER

By using commercial sodium fluorid in the form of powder, or as a dip, all species of poultry lice may be destroyed at one application. As the high efficiency of sodium fluorid in destroying lice on poultry is of recent discovery the material is not ordinarily found in all drug stores. With a demand for it, however, local druggists will secure supplies. Poultry keepers who desire to thoroughly eradicate lice from their flocks should write the United States Department of Agriculture, Washington, D. C., for Farmers' Bulletin 801, which gives, with full details of the use of sodium fluorid, complete information on the control of mites and lice.

The Eggs You Didn't Get

How can you expect a hen to lay 150 eggs a year or even 50 eggs if her vitality is sapped by lice and mites—all she can do is itch and fret and cost you money.

Rations for Turkeys

Written for California Cultivator By Jean A. Koethen

METHODS of feeding turkeys have changed radically in the last five years. From believing that certain articles of food are wholesome and certain others taboo for turkeys we have switched round to the theory that what is fed is, within reasonable limits, far less important than how much. This is the latest promulgation of the Rhode Island experiment station, and there is no higher authority. It is assumed, of course, that poults will be given food suitable for their very delicate digestion, but the vital thing is that they be not overfed on whatever is given.

At the Rhode Island station the first feed for baby turkeys consists of finely chopped boiled egg and dandelion or lettuce. This is left before the poults just while the caretaker is going his rounds, leaving and removing the trays, no longer, and is given on the morning of the second day out of the incubator. At 11 o'clock the meal is repeated. At two the poults are given trays containing stale bread thoroughly soaked in sweet milk. At 5 o'clock they have egg with onion top or lettuce. The next day they have one meal of bread and milk, one of chick feed and two of egg and greens. A little rolled oats is added to the breakfast of egg and greens. After the fourth day they have but three meals, one of chopped egg and greens, one of chick feed and one of bread and milk. After ten or twelve days the egg is omitted and the ration consists of chick feed, rolled oats, bread and milk and greens, and the only change which is made in this ration for two months or more is the addition of sour milk, which is placed before them in increasing quantities after the second week. In regard to the ration for the maturing poults, in addition to green feed and sour milk, the bulletin says: "By September the rolled oats may be given up, except as an occasional feed, and both morning and night feedings made to consist of mixed grain (cracked corn and wheat) alone; or if the poultryman has time to prepare it, one or two meals per day may consist of a special mash in which some beef scrap is present to take the place of the insect food which, by this time, is much reduced in amount on the range. This mash mixture is scalded, then is added a quart of sour milk. It is then mixed with shorts so as to "come up light." Next carrot or dandelion tops are chopped fine and mixed with the former combination at the rate of two parts green to one of the combination. A certain turkey raiser employs this ration for turkeys from the time they are five days old to the time they are marketed, and feeds little else.

Breeding stock at the Rhode Island station is given the following grain mixture: cracked corn, three parts; barley, two parts; wheat, two parts; oats one part. This is fed night and morning in trays or troughs at the rate of one quart to every six birds for each feeding. No other feeding is required, but sour milk is given when available.

My own ration for baby turkeys consists of stale bread chopped with young onions or onion tops, steel cut oats and cottage cheese. This is mixed in the proportion of one-third cereal, one-third green (lettuce or onion) and one-third cottage cheese. After a couple of weeks the bread and steel cut oats are replaced by rolled oats, and cracked wheat is added. On this combination rolled oats, green feed and cottage cheese, with cracked wheat replaced by whole wheat as soon as the birds will eat it for grain feed I have raised many turkeys. What I shall do now that wheat is out of the question and corn more expensive than wheat I do not know. Many persons have good success with milo and Egyptian corn, and I presume we must use what we have or stop raising turkeys. If, as this bulletin declares, the essential thing is not the feed, but the amount that is given, we may find that milo does quite as well as wheat.

"Keep them hungry" is the one infallible rule for feeding young turkeys. Even this does not always work. I have seen poults die of blackhead that had apparently always been hungry till the day they began to droop. It was evident, then, but too late, that they had not been kept hungry enough. The Rhode Island station endeavors to solve the problem by "time feeding," i. e., by leaving the tray of food before the poults only two or possibly three minutes. So far this seems to have proved satisfactory. Obviously we must feed very much less than we think the poults need and be governed largely by what they may have found on range. Poults that have good range need little else. To feed always just what the birds need and no more requires a more delicate discrimination than most of us have attained. That we shall attain it sooner or later I do not for a moment doubt.

NATIONAL EGG LAYING CONTEST

By T. W. Noland, Director

In the contest at Mountain Grove, Missouri, Pen 36, S. C. White Leghorns from Missouri won the cup again for June, with a record of 122 eggs. This pen has won the last three months in succession. The total number of eggs laid in June was 4905 or an average of 16.35 per hen.

Following are the leading pens for each variety for June: S. C. White Leghorns, Missouri, 122 eggs; Anconas, Missouri, 116; Silver Wyandottes, Missouri, 113; White P. Rocks, Idaho, 105; Barred P. Rocks, Michigan, 105; S. C. Reds, Missouri, 105; White Wyandottes, Missouri, 104; Buff P. Rocks, Missouri, 101; R. I. Whites, New Jersey, 97; R. C. Reds, Missouri, 95; S. C. Brown Leghorns, Missouri, 93; Buff Wyandottes, Missouri, 92; Black Orpingtons, Missouri, 87; Buff Orpingtons, Missouri, 75; White Orpingtons, Missouri, 70.

BEEKEEPERS TO MEET

The Southern California Beekeepers' Association, formerly known as the Los Angeles County Beekeepers' Club, is planning for a picnic and all-day meeting Thursday, August 1. The picnic is to be held in Beverly Glenn at A. S. Tice's Camp Enticing. There will be addresses in the forenoon, picnic luncheon at noon, and in the afternoon talks by members and others regarding subjects of interest to the beekeeping industry. Those who go by rail may take Sawtelle car, Fourth and Hill Streets, Los Angeles, 9:15. They should get off at Country Club station, where conveyances to the picnic grounds will be provided. Those going by auto go by the way of Wilshire Boulevard from Los Angeles, past the club to Beverly Glenn Boulevard, thence where signs will indicate the scene of the picnic.

Attendants are requested to bring sandwiches, cup and spoon. Coffee and some other good things will be served on the grounds.

Poultry can be made to Pay

THERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe.

Household Department

DISCOVERED!

Molly had a knitting bag,
'Twas pink, with yellow dots,
And on it were the sweetest birds,
Cerise, with sea-green spots.

She carried it to town one day,
The public to impress;
And all the folks who saw her said:
"Some knitter! Well, I guess!"

But Molly tripped upon the curb
And open flew the bag.
They had to help her pick things up
That traffic might not lag.

They gathered all her groceries up,
They rescued meat and fruit
They salvaged powder-puff and comb,
And sundry other loot.

A box of sweets, some magazines,
An auto veil for fitting,
Fair Molly had these in her bag—
But not one stitch of knitting!—J.B.

REFORMED

By Gordon Veeder Carruth, in Youth's Companion

AFTER supper on the fourth day after his wife had left he stood with his hands in his pockets, surveying the heap of dirty dishes to which he had just added those that he had used.

"There's no doubt about it," he murmured to himself. "Those dishes ought to be washed. Mary would be scandalized. Still," he went on, as he searched for a ray of hope, "she won't be back for ten days yet, so I've plenty of time to do them before she comes."

As he spoke, his glance wandered through the door to the china closet in the dining room.

"Why, I've hardly made an impression on them yet," he said, brightening perceptibly. "Lucky thing we had so many given us. After all, now that they've got ahead of me, there's no hurry. I'll let them go as long as I can and then wash them all at once. That will be better than messing round half a dozen times with a little dab lot."

Thereafter each evening after supper he fixed an apprehensive eye on the china closet. Slowly its contents went to join the pile in the sink, until there came the night when there were no more clean dishes.

"Mary won't be able to leave her mother for a week yet," murmured Mr. Thornbury as he faced the foe in the kitchen. "Besides, it wouldn't be fair to ask her to come home and tackle that pile of dishes. Moreover, I've got to eat until she does come home. There seems to be nothing for it, old man."

It was then eight o'clock. Mr. Thornbury found the dishpan, filled it two-thirds full of water and set it on the gas stove to heat. While he waited, he sat down to read the evening papers. When he finally remembered his dish water it was steaming hotly.

"All the better," he said to himself. "I've often heard Mary say that the hotter the water the easier the washing."

He slipped as many dishes into the pan as it would hold, found the soap and the dishrag and dropped them in also. Then he rolled up his sleeves and, whistling cheerfully, plunged his hands into the water. He took them out at once and danced about the kitchen, waving them over his head in the cooling air.

"I never knew that Mary had patent asbestos skin on her hands," he said, when he came to the rational part of his discourse. "I'll have to look into it when she comes home. Perhaps I can contribute an article about her hands to the Medical Review.

His eye fell on a dish mop, and he seized it eagerly. "Maybe this will help," he said, "if it doesn't perish from the heat."

It did help. No longer was it necessary to put his hands into the water, for he could poke the dishes out until he could grasp them with his left hand and wash them with the mop. He became more cheerful.

"A wonderful invention," he said to himself. "Probably Edison had to wash the dishes once and scalded all the skin off his hands the way I did, and so sat right down and invented this useful little instrument. Beautiful instance of action and its reaction on the inventive mind."

Mr. Thornbury thrust the dish mop forcibly down into a tumbler filled with water. A thick stream of the hot, soapy water shot up like a geyser and penetrated his shirt sleeve.

"Action and reaction," he muttered, clapping one hand on his afflicted arm and taking quick steps about the kitchen, "action and reaction, action and re— Stop, now-" he commanded himself. "Don't lose control, old man! Now! Three deep breaths! One! Two ! Three!"

When he was calmer, he continued his task gingerly. He got along all right until a gathering of grease on the water warned him that it was getting cold. Sighing heavily, he poured it out and set more water on the stove to heat while he dried the dishes he had just washed.

Mr. Thornbury had fair success with the wiping, although one teacup rather uncannily dropped off its handle.

"Feeble stuff they put in this china!" he muttered as he gathered up the fragments. "What I like is the sort of ware they have in the quick lunch rooms. Why, I dropped a cup off the arm of my chair the other day and it bonuced seventeen times before it stopped. Never even chipped it. I'll have to speak to Mary about getting some of that—although something tells me she won't do it."

Having gained valuable experience with his first lot of dishes, Mr. Thornbury got along slowly but without mishap with the second until the very last. Then a heavy bowl slipped from his fingers and fell back into the dishpan. A large wave immediately rose over the top of the pan, slapped Mr. Thornbury about the waist and flowed wetly down to collect finally in his low shoes and in the cuffs of his trousers.

In a high, falsetto voice, full of the tremolos of deep emotion, Mr. Thornbury sang:

"Throw out the life line!
Throw out the life line—"

A vigorous pounding on the floor of the apartment above notified him that his music was not well received.

"My friend," he said solemnly, addressing the ceiling, "if you were aware what a volcano of revolt is rumbling below you, you would be thankful that nothing worse than a little song penetrates your floor."

After a somewhat ineffectual attempt to dry himself, Mr. Thornbury worked wearily but warily at his third and last lot of dishes. In spite of his care, however, a plate collapsed weakly when it slid from his fingers into the porcelain sink. Finally, there was nothing left to wash except a frying pan or two and ten days' accumulation of milk bottles. He scoured with aching arms at the pans until they were clean, and then he attacked the milk bottles—a difficult task for the amateur.

Slipping a small piece of soap into the first one, Mr. Thornbury admitted an inch or two of water, clapped his hand over the mouth of the bottle and shook it vigorously. The air within the bottle, suddenly expanded by the heat of the water, shot a stream of suds through his fingers and into his eye.

Mr. Thornbury was too far gone to do anything except groan.

"Even the milk bottles!" he said bitterly. "Who would suppose that a peaceable-looking milk bottle would turn savagely on the man that took it in and gave it a home?"

If anyone had seen Mr. Thornbury when everything was at last washed and dried, he would have been astonished that a light of such determination could gleam in the eyes of a man so physically jaded.

Working rapidly, he placed every piece of china and silverware in the china closet. To be sure, they were not exactly in the order in which Mrs. Thornbury usually kept them, but at last he got them all in. Then, after standing for a moment in deep thought, he took out one cup, one plate, one cereal bowl, a knife, a fork and a spoon. Those he placed on the dining-room table and then carefully locked the china closet.

He next carried the key to his desk in the library, where he sat down and addressed an envelope to his wife. In it he inclosed the key and a short note. Then he went down four flights of stairs to the street and mailed his letter in a box on the corner two

The Cultivator Patterns

8900—Ladies' Surplice Waist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The shoulder edges of the back extend over the front yoke effect.

8926—Girls' Dress. Cut in sizes 4, 6, 8 and 10 years. The lower edge of the dress is slightly gathered on a cord.

Ol' Squire 'Tater 'low he goin' to be mighty nigh king er de roos' 'mong garden sass folks. We alls kin eat him as a 'tater boiled, baked, fried, stewed, cooked wid cheese en dey gettin' so dey make im inter flour; so's we kin "substi-tute" him fo' wheat flour. He's de "substitutenest" of all de vittles, he sez.

De udder garden sass folks lak inguns, tomatues, cabbage en turnips en squash don't need to git peeved, 'cause dey's goin' to be room in de pot fo' de whole tribe. Ev'y las' one on 'em can he'p save wheat en meat fer de boys dat's doin' de fightin' over yander.

blocks away. Wearily he dragged himself back; weakly he climbed the four flights of stairs, and tumbled into bed exhausted. It was then one o'clock.

Not until some time after Mrs. Thornbury came home did she succeed in eliciting from her husband the painful explanation of the note that she had received with the key. It read as follows:

"Dear Mary: I have locked up the china and am sending you the key. Keep it, if you wish to save either me or the china.—Your wiser and sadder, Howard."

DESSERTS FROM SUBSTITUTES

Written for California Cultivator by Blanche A. Gardiner

There has been so much said recently about the inferior qualities of the wheat flour substitutes, that some people seem to think that practically all appetizing desserts must be eliminated from their menus. This, however, is far from being true. Just as dainty and palatable desserts may be made from the other flours as from the wheat. There are certain points though that must be followed.

First.—If the recipe on hand calls for two cups of wheat flour, use two and a quarter cups of the substitutes; and instead of the customary two teaspoons of baking powder, it will be necessary to use three.

Second.—It is more satisfactory to make cup cakes than layer cakes, for they hold together better, and as there is more crust they are less liable to fall.

One of the simplest of these is made from ¼ cup shortening, ½ cup sugar, 1 egg well beaten in cup, then fill cup with milk; 2¼ cups of mixed flour (equal parts barley, oat, rice) or (barley, potato, corn) or (barley, rice, corn); 3 rounded teaspoons baking powder; 1 teaspoon lemon or vanilla flavoring.

This will make twelve good-sized cup cakes or a two-layer cake or a good loaf cake. By using this recipe as a foundation, a great many delicious cakes may be made. For example, add cocoanut, ground nuts, raisins or oatmeal which has been cooked, to the cake dough, and a different result will be obtained each time. With a hot sauce these cup cakes may be used as individual puddings. Different kinds of frostings add to the daintiness of this recipe. The following is most appetizing: ½ cup powdered sugar, ½ cup cocoa, 1 tablespoon shortening; rub these ingredients together and add hot coffee until the right consistency for frosting is reached. Hot water may be substituted instead of the coffee, and crushed raspberries or strawberries added to the mixture.

It is not necessary to go without desserts, and these cakes are both wholesome and nourishing and contain nothing which should be conserved.

HAY

Under date of July 20, Scott, Magner & Miller says:
Receipts past week 3234 tons, last week 2139 tons. This large increase in receipts was to be expected as baling operations have been in progress for some time. A great deal of this hay has had to be hauled into dealers' warehouses, and they are fast becoming filled, whereas a short time ago it was difficult to keep them from being empty.
Consumers have held back awaiting concessions in prices, which they claim have been out of reason, and have only been buying in a small way for requirements. Receipts of alfalfa for this time of the year have been lighter than usual, although more of this commodity arrived during the latter part of the week than for some time past. There has been a good demand, with the supply fully up to all requirements. The second cutting river hay has started to arrive and is given preference over the interior articles as usual.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:
Fancy Wheat Hay, large 5 wire bale .....26.00@27.00
No. 1 Wheat or Wheat and Oat Hay .....22.00@24.00
No. 2 Wheat or Wheat and Oat Hay .....19.00@21.00

Other Tame Oat Hay .....21.00@23.00
Wild Oat Hay .....18.00@22.00
Barley Hay .....18.00@22.00
Alfalfa, first cutting .....16.00@20.00
Alfalfa, second cutting .....22.00@24.00
Stock Hay .....17.00@19.00
No. 1 Barley Straw, bale .....50@80

GRAIN

Wheat—Government prices: Common white hard, base price, $3.50 per cental, or $2.10 per bushel of 60 pounds delivered in terminal warehouses in bulk; soft white, base prices, two cents per bushel less, or $2.08 per bushel; white club (including Sonora), $2.00 per bushel. If wheat, after cleaning, weighs 60 pounds or more to bushel, base price stands; if 58 to 60 pounds to bushel, three cents per bushel reduction; if 56 to 57 pounds six cents per bushel less; if less than 56 pounds, grain becomes sample grain and sells on its merits up to within one cent per bushel of 56-pound wheat. Additional charge made for sacks.

Citrus Fruit Market

Los Angeles, July 24, 1918.

California grapefruit seems to have come to its own and many sales are being made around the $5.00 and $6.00 mark.

Oranges are again approaching spectacular prices and many auction sales have been made around $8.00.

Lemons are likewise stronger notwithstanding cargos of Mediterraneans are being received. There is a keen demand however, for high quality California lemons.

Shipments

Shipments of citrus fruits to date since November 1, 1917: Southern California; oranges 12,123, cars, lemons 4290, total 16,413. To same date last season oranges 34,209, lemons 6519, total 40,728. Central California this season; oranges 2536, lemons 115, total 2650. Last season to same date; oranges 4655, lemons 164, total 4819. Northern California; oranges 203, last year same date, 845.

AT THE AUCTIONS

July 17

New York: Val. $4.30-7.95, lem. 4.10-6.35.
Boston: Val. 5.40-7.60, lem, 4.80-6.95.
St. Louis: Oranges higher. Val. 3.00-6.60, lem, 2.30-4.15.

July 18

New York: 9 oranges, 7 lem. Oranges higher, lem. lower. Val. 4.15-7.85, lem. 2.35-6.20.
Boston: Val. 5.95-6.30, lem. 4.10-6.10.
Philadelphia: Val. 5.40-7.80, lem. 2.90-5.10.

July 19

New York: Orange market strong, lemons easy with only best grade in good demand. Fifty-five thousand cargo Mediterraneans today. Val. 4.15-7.50, grapefruit 6.00-6.75, lem. 3.45-6.25.
St. Louis: Val. 1.95-5.55, lem. 1.55-4.75.
Cleveland: Val. 5.15-6.65, lem. 2.50-6.05.
Boston: Val. 5.50-6.25, lem. 5.35-6.20, grapefruit 5.80.

July 22

New York: Oranges higher. Val. 6.00-8.65, grapefruit 4.75-6.85, lem. 4.15-6.90.
Philadelphia: Oranges higher, lemons firm. Val. 4.80-7.95, lem. 4.45-6.75.
Boston: Val. 4.50-6.60, lem. 5.80-7.20.
St. Louis: 3 lem. 2 oranges. Val. 4.25-6.65, lem. 2.95-5.25.

July 23

New York: 7 oranges, 1 grapefruit, 6 lemons. Higher. Val. 5.45-7.90, lem. 5.15-7.35.
Philadelphia: Val. 7.35-7.75, lem. 7.15-7.65.
Boston: Val. 4.90-6.80, lem. 5.40-6.80.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, United States department of agriculture, report is made of the following shipment of cars of products from California for the week ending July 22: Apples, 4; apricots, 109; blackberries, 1; cabbage, 4; cantaloupes, 65; carrots, 3; cherries, 1; dried apricots, 10; dried beans, 6; dried peaches, 1; dried peas, 1; dried prunes, 7; garlic, 2; grapes, 44; lettuce, 2; loganberries, 21; mixed fruit, 23; mixed vegetables, 34; mixed fruit and vegetables, 12; mixed dried, 1; onions, 58; peaches, 17; pears, 290; plums, 240; potatoes, 545; raisins, 92; tomatoes, 38; watermelons, 54; Arizona cantaloupes, 388; Arizona watermelons, 5; Nevada Cantaloupes, 5.

MARKET NOTES

California is shipping largely of potatoes to the Eastern markets; this is causing slight shortage and better local conditions. However, there have been vast quantities of low grade stock.

Imperial Valley is now shipping out Malaga grapes which have been selling around seven and eight cents a pound.

Fresh apricot supplies are decreasing rapidly and prices are advancing.

Imperial Valley has closed its cantaloupe season with larger shipments than last year. Arizona and Colorado are now supplying the Eastern market. The Turlock district is not expected to reach its highest production until well into August.

California garlic crop will be materially short, largely due to the spring drouth, and the acreage is about 75 per cent of last year. The yield will not be 60 per cent of normal. There are occasional carload shipments. The growers are receiving 69 cents.

Dried fruit packing and shipping is almost swamping some of the shipping organizations. Last year's prune and peach crop is practically cleaned up and this is inducing more general purchasing of this season's dried crops.

Beans are still in the dumps, and holders of last year's crop find it almost impossible to sell.

The public service of the state of Washington has filed complaint with the interstate commerce commission asking a review of recent freight rates which concern the fruit growers of the Northwest. The increase if it stands, will require an additional payment of two and a half million dollars on this fall's fruit shipments.

Michigan finds its peach crop materially reduced because of severe winter conditions which injured many of the trees. In some sections fully 90 per cent of the trees were winter killed.

The recently announced raisin prices indicate about one cent higher price will be obtained than last year. The bulk Muscat seeded will bring 7½ to 8¾ cents, three crown bringing 8 cents or a 5½ cent price to grower. 1918 dried peaches f. o. b. common shipping points. Fancy Yelows 12½; Muirs 12 7-8; peeled 14 3-8, for box unfaced add one to two cents. California Peach Growers' guarantee prices till December 31. The prices represent an increase of about three cents per pound.

American Grown Egyptian Cotton Saves Shipping Space

When the war trade board announced the revocation of all outstanding licenses for the importation of Egyptian cotton and that importation of only 80,000 bales of long staple Egyptian cotton will be allowed during 1918, attention was called to the increase in the production of Egyptian cotton in the irrigated lands of Arizona and neighboring states. The production in 1918 of this American grown Egyptian cotton, according to specialists of the United States department of agriculture, probably will be between 40,000 and 50,000 bales. In 1917 the production was 16,000 bales, and in 1916, 3,331 bales. The acreage this year is estimated at 80,000, compared with an acreage of 35,000 in 1917. Egyptian cotton is used largely for automobile tires and high-grade sewing thread, and spinning tests by the bureau of markets of the department indicate that it can be used advantageously in the manufacture of airplane and balloon fabrics. Commercial production of Egyptian cotton in the American southwest was begun only in 1912, after long experimentation by the bureau of plant industry, but already the industry has grown to such an extent that imports can be cut to 80,000 bales, thus saving a great amount of cargo space on the long water haul from the land of the sphinx.

Dependability of Tractors

Of more than 600 tractor owners on representative farms in Illinois who reported in a recent survey conducted by the United States department of agriculture, a report of which is published as Farmers' Bulletin 963, 54 per cent stated that their outfits were not disabled a single day when needed during the entire season last year. Of the remaining 46 per cent the average number of days their tractors were out of commission when needed was five. This average, however, did not include one man who stated that his machine was not usable about half the time.

The reports of tractor owners indicate that with a careful and proficient operator a gas tractor is a very dependable source of power. Occasional slight delays probably will be encountered, but serious ones will be exceptional, whereas with a careless or incompetent operator expensive delays are apt to be frequent.

About 90 per cent of the tractors were operated by the owner or some member of his family, the best results usually being obtained by this class of operators. Thirty-six per cent of Illinois owners reported no time lost in the field on account of trouble with the outfit. This probably means that the time lost was not worth mentioning. Most men do not consider it trouble so long as they know at once the cause of stoppage or other irregularity in the engine's operation, and are able to remedy it promptly. The average time lost per day by the 46 per cent reporting trouble is a little over three-quarters of an hour.

Wagon-Box Lining to Save Grain

In support of the nation wide effort to prevent waste of food, Frank Svoboda, a Bohemian farmer living in Oklahoma, urges cloth or canvas linings for wagon boxes during threshing and grain handling seasons. "From 25 to 50 bushels of wheat could be saved daily on the average farm at the time of threshing," Mr. Svoboda believes, "if such lining were used in the bottom of every wagon to keep grain from sifting through the openings. Few farm wagons used for hauling bundles are grain tight. Canvas cloth should also be used at the threshing machine when the bundles are unloaded. Especially when the season is dry and kernels of wheat drop from the stalk upon mere touching, large quantities of grain are lost in hauling wheat from the field to the machine and during threshing operations."

This suggestion reached Washington, where it secured the hearty endorsement of the United States food administration.

Hoarding

What is hoarding?

Storing away more than the food supplies needed for a reasonable length of time.

Why do people hoard?

Because they fear that a shortage is coming and wish to protect themselves, even though it be at the expense of others.

What are some of the evil effects of hoarding?

It raises prices; it imposes a heavier burden on those already doing their utmost; it throws out of joint the distribution system; it results in waste where there are no proper facilities for storing.

What is the moral wrong of hoarding?

It is selfish, cowardly, unpatriotic.

Why is hoarding unnecessary?

Because the government is protecting the food supply.

Is there any law against hoarding?

Yes. In the Food Control Act.

Is there any punishment for hoarders?

Yes. The Food Control Act provides fines of not more than $5,000 and imprisonment for hoarding of food by dealers, manufacturers, or householders.

How is the dealer punished for hoarding?

His license is revoked.

RANGE CATTLE IMPROVEMENT

There is great activity among the stockmen of Northern California in range cattle improvement. The Northern California Cattlemen's Associations are particularly active in this. Some of the best registered bulls produced in California are being used on these northern ranges—and many are being imported from the Eastern states.

A HARD LIFE

A soldier in the English army wrote home: "They put me in barracks; they took away my clothes and put me in khaki; they took away my name and made me 'No. 575'; they took me to church where I'd never been before and made me listen to a sermon for forty minutes. Then the parson said: 'No. 575, art thou weary, art thou languid?' and I got seven days in the guardhouse because I answered that I certainly was."

Brentwood Irrigated Farms

In Eastern Contra Costa County.
Land Planted to Alfalfa, also first class orchard land. Tracts of twenty acres and up with easy terms of payment.
For Prices and Descriptive matter address

Balfour, Guthrie & Co., Land Dept., 350 California St., San Francisco

Know Live Stock

Characteristics of every breed—best methods of breeding, training and general care with specific directions on how to buy and sell are given in this best of all LIVE STOCK and COMPLETE STOCK DOCTOR BOOK, a 1400 page Cyclopedia of Live Stock for the Western Rancher and Stock Owner.

This is without doubt the greatest book value on the subject ever offered to readers of this paper. It is the only work of reputable competent authorship covering these important subjects, recommended for general popular use, as a safe guide for the farmer and stock owner, by educated surgeons and by the press. The author, A. H. Baker, M. D. V. S., was the founder and for 27 years Dean and Professor of Theory and Practice of Veterinary Medicine, Chicago Veterinary College.

A great book of 1400 pages.

If you would know all about Horses, Cattle, Swine, Sheep, Goats, and Poultry, their anatomy, with careful and illustrated analysis of the points of Domestic Animals with all the diseases to which they are subject, with remedies for the curable diseases, send for this great book. It explains by methods of object teaching, with written instructions, how to know diseases in domestic animals, the causes, prevention and cure.

Information and instruction are given in plain simple language free from technicalities, but scientifically correct. The remedies prescribed are readily obtained and easily applied.

Over 30 color plates and 1000 object lesson engravings, including one illustrated chart for accurately telling the age of the horse from six months to twenty-nine years old.

The Book, Livestock and Complete Stock Doctor, is published in a single neatly and durably bound volume of 1400 pages 6½x9½, weight seven pounds and bound in law sheep. A new copy will be sent complete to any address in the United States upon the following terms:

One subscription to California Cultivator at $1.00 and $6.00 in cash.
Two subscriptions to California Cultivator at $1.00 each and $5.00 in cash.
Four subscriptions to California Cultivator at $1.00 each and $4.00 in cash.
Five subscriptions to California Cultivator at $1.00 each and $3.00 in cash.
Six subscriptions to California Cultivator at $1.00 each and $2.50 in cash.
Twelve subscriptions to California Cultivator at $1.00 each with no additional payment.

This is an easy manner in which to obtain this useful and valuable book. Get up a club of 12 subscriptions to California Cultivator among your neighbors or send part subscriptions and part cash as above and you will find that the book will pay for itself in satisfaction to you many times over. We will refund money on return of book in good order if the book is not as advertised.

Address all orders to,

Bringing the Farm to the Railroad

Since the coming of the motor car, the remote farm is no longer remote. Distance has been conquered. Miles have been shortened. Minutes have taken the place of hours spent in transportation.

In this transformation, the most important advantage to the farmer is in being brought next door to the railroad.

Milk and other perishable products can be marketed quickly. Needed supplies are more available. The farmer is in direct touch with the world.

Using his car largely for business, the modern farmer treats his car as a business proposition. Equipment is purchased with extreme care and judgment. Values are studied. Mileage records are kept carefully.

That is why the sales of United States Tires are increasing so fast in prosperous farming communities. They have demonstrated not only long-mileage qualities but greater reliability. They make your car more useful. They give a bigger return on your investment.

United States Tires are Good Tires

Wherever you live or whatever car you drive, there is a United States Tire built especially to fit your conditions. You have a variety of treads and types from which to choose but the quality and values are always United States standards.

Any United States Sales and Service Depot will cheerfully aid you.

For passenger cars—'Usco', 'Chain', 'Royal Cord', 'Nobby' and 'Plain'. Also Tires for Motor Trucks, Motorcycles, Bicycles and Airplanes.

United States Tubes and Tire Accessories Have All the Sterling Worth and Wear that Make United States Tires Supreme.

'Usco' 'Chain'

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

There are thousands of busy fruit yard scenes, such as is depicted in the photograph on the cover of this issue, all over California. In addition there are hundreds of larger plants where hundreds of tons of fruit are cured. A keen demand is already taking these fruits from these yards and placing them in the markets of the world. There has been a bit of hesitancy on the part of the market as to apricots and some other most desirable products, but the situation is being cleared.

SUGAR SHORT

Later estimates indicate a most serious shortage of the present season's sugar production. It now appears that only in isolated cases will there be any material increase, and in many sections like California a very great reduction will be made. It may be recalled that in the long dispute between grower and manufacturer the food administration was called in and failed utterly. Later a commission was appointed to investigate and bring warring elements together. Growers were willing to produce more beets if a fair price were named, but the commission appointed was unable to produce its report in time to enable the growers to plant, and in addition the recommended price was not at all attractive. The growers were not slackers for they were simply demanding fair treatment. It is to be hoped an effort may be made before too late this coming year to make adjustments which will permit growers of California to produce sugar to the limit.

COTTON

The cotton grower is observing with some degree of concern the depreciation in the cotton market, or rather the situation foreshadowed when the new crop comes on. Presumably there will be no more cotton than will be needed, but the production will be immense, and the department of agriculture is taking a hand in the matter and endeavoring to stabilize the market. One suggestion has been that every grower consent to hold and store at least two bales out of every ten. In addition, let every grower market in installments, month by month. Assistant Secretary Ousley says:

"It is an old saying that the average cotton farmer will not sell when prices are advancing and will not hold when prices are declining. From what I have learned during the last few weeks I am inclined to the view that the cotton farmers today are resolved and are prepared to pursue a more rational course. I find little evidence that the actual farmer is the least panicky over the cotton situation. He remembers the sad experience of 1914 when we brought a big crop to market just after the world war broke out, and because there was then more cotton than could be sold and delivered, we fell into hysterics and sacrificed a large part of it below cost of cultivation. If we had been wiser then, we would have retired a small part of the crop and sold the greater part of it at fair prices because, as a matter of fact, we had to hold a small part and ultimately we absorbed it in the reduced crops of the three succeeding years.

"Some people seem to have the notion that the situation now is as serious as it was in 1914. It does not so appear to me. But even if it were, if we will only profit by the experience of 1914 we can easily solve the problem."

DOING OUR SHARE

All who are following closely reports of action at the front often note that a trivial incident, or a lack of proper support at some one point of the line, may make great difference in results. War in modern times is wonderfully complex, and the boys in the trenches who are bearing the brunt of the fight sometimes appear to have only a small part in the final determination. No matter how true to their trust, nor how brave, our support thousands of miles away must be complete. The food administration is appealing for fullest support from every true American.

The food program is a fighting program. We here in this country have the education, we have the brains, we have the loyalty. We must live up to our privilege of backing up our splendid men who represent us in the army and navy. Let each of us live so each day that when our boys come back from France we can look them in the eye and say: "I did my share and all that I could do at home."

KEEP YOUR GRIP

The daily press during the past week has been filled with most cheering information. Mile after mile the Huns have been driven back. As we go to press a countercharge is being made by German troops, estimated to exceed 500,000, on a comparatively short sector. We believe our boys will hold them, but if the Allies are pushed back it will only be temporary. We are reminded of a motto which has prominent place in the office of the shipping board in Washington: "Noah was 600 years old before he knew how to build an ark. Don't lose your grip."

BILLION

The size of a billion is appreciated a little better when we stop to consider that Uncle Sam will pay out $45,000,000 every year for interest at four and a half per cent on each billion borrowed. During the past year the total war cost has been about 26 billions. Of course a part of this has been raised on Liberty Bonds; some by direct taxation. Another year a greater proportion must be raised by taxes; to that end congress is wrestling with a tax scheme for the coming fiscal year.

It is hardly probable that any tax law can be devised that will be entirely just to all, but there must be less of favor shown to great incomes; the excess profits tax was outlined a year ago so as to be far more just to people with small incomes. Millions were being made for holders of "war brides," and the bill was planned so as to take some of these excess profits. It was so modified, however, that the greater proportion of these immense profits are held by large operators. About one and a half per cent of the families in the United States received 12 per cent of the national income, or around eight billion dollars. Now comes the Farmers' National Committee and recommends that where any income exceeds $50,000, all excess over that sum shall be taken by the government. This committee estimates that a tax of 80 per cent on the excess war profits will yield this year at least four and a half billions.

This matter of taxation is a long one and so far as possible must be just, and to be just must lift or rather reduce the burden of small incomes and reduce the swollen fortunes being made.

This Week's War Notes

The state department is contemplating giving approval to a loan of $50,000,000 to China, the $50,000,000 to be used in strengthening China's frontiers.

One Los Angeles concern has signed a contract with the naval construction board for marine engines to the value of $4,000,000.

German newspapers report that King Ferdinand of Bulgaria has gone to foreign lands on account of his health.

Reports from China indicate that the Czecho-Slovaks, who are operating with the Allies in Siberia, are advancing but are in great need of reinforcements from the Allies.

The strike in British munition works has been largely brought under control. The government served notice that the strikers might return to work or be sent to the trenches.

Finland seems to have become the absolute vassal of Germany. It is anticipated that Germany plans using Finland in its scheme to secure entire control of Russia.

Hotels, restaurants and those who have given voluntary pledges to abstain from all wheat have been released by the food administration. The half and half rule will still obtain in the purchasing of flour.

Germans are in entire control of the grain field section of Southern Russia, and where peasants have deserted their fields German soldiers are harvesting the wheat and shipping direct to Berlin.

The efficiency of American, French and British flying machines is being demonstrated. One day's actions are reported in which 11 tons of bombs were dropped on enemy's ammunition dumps and supply stores.

The chief of staff of the Japanese imperial army has wired General March congratulations and expresses great admiration for the work of the American army on the French battlefield.

It has been known for some time that relations between Turkey and Germany were somewhat strained and on Tuesday of this week definite announcement came: "The relations between Germany and Turkey have been severed."

The Red Cross reports great need of attention to be given to Russian prisoners returning from Germany. They have been starved and are almost invariably afflicted with tuberculosis. The United States government has approved liberal shipments of food.

The United States treasury has extended additional credits of $100,000,000 to Italy and $9,000,000 to Belgium. This increases credits extended to Belgium to $145,250,000; to Italy to $760,000,000. Total loans of this country to Allies, $6,380,040,000. Advances are now averaging about $400,000,000 a month.

The Pacific Coast has been honored by being given the first exhibit of war trophies. This exhibit is of various war appliances, many of them captured by General Haig in the great drive near Lens. There are 17 carloads of exhibits which were opened in San Francisco and are now being exhibited in Los Angeles.

Because so many boys under 18 have secured entrance to the service on making statement that they were 18 or above and later have had to be discharged on request of their parents, with proof of under age, the war department has ruled that hereafter every minor enlisting must furnish proof that he is 18 years of age.

American boys are making good. It has been a week of French and American victories, and every day has shown the hardest fighting of the war. The Teuton lines have been pushed back from the Marne over the Ourcq. Fere en Tardenois, one of the large supply bases of the Germans, has been captured. Soissons is threatened, but is still held by the Germans. The enemy has been pressed back from ten to 15 miles. His resistance became more strenuous Tuesday when vast reserves were apparently thrown into the battle line. Captured German soldiers are nearly all wearing new and flashy uniforms, indicating that the Germans have been preparing for triumphal entry to Paris. This recalls the fact that at the time of the first battle of the Marne in 1914 a full trainload of banners, tinsel and trappings was captured by the French troops. It was then supposed to have been prepared for the entry of Paris at that time. The British have made light attacks along the line in Picardy, but as a rule the northern end of the battle line has been very quiet. The principal advance has been from the Marne northward and between Rheims and Soissons. However, the line south of Rheims has been advanced in favor of the Allies.

The Washington Navel Drop in 1918

By Robert W. Hodgson

NOW that the June drop is practically over, an analysis of the phenomenon as it occurred this season may help to clear up some difficulties in the minds of growers.

In the first place, quite generally throughout the state the amount of bloom was much heavier than is normally the case. Usually the amount of bloom increases the farther inland the district, but this last spring uniformly all over the citrus sections the trees bore a very heavy bloom. The cause is not definitely known but probably it has to do with the vigorous condition of the trees following the light crop of last season.

In the second place, the proportion of flowers which "set" as compared to what it normally is in Southern California was small. By far the greater part of the young fruits were shed while still in the flower stage. This was to be expected on account of the extremely heavy bloom. It was physically impossible for the trees to carry to maturity anything like the number of flowers borne. Moreover a certain proportion of navel flowers are not capable of development but must be shed because of lack of a normal ovary. Naturally the heavier the bloom the greater the number of imperfect flowers. Nevertheless the number of blossoms which did "set" was enough to make crop prospects very bright and the May estimate for the orange crop was between 95 and 98 per cent.

In the third place, the June drop was late this season and did not take place in May or early June as it usually does, but commenced late in June and has continued until the middle of July. The average size of the shed fruits has been unusually large this season and practically all of the "dropped" fruits abscissed at the base of the ovary leaving the stem and button on the tree.

In the fourth place the weather in Southern California this season has been characterized by moderate temperatures and high atmospheric humidity. It has not been excessively dry nor excessively hot and still the drop has been quite severe especially in certain sections.

Some citrus growers are now estimating the crop at not more than 50 per cent. Nevertheless the fact remains that the crop varies markedly in different sections, being much heavier in Los Angeles and Orange Counties than in Riverside or San Bernardino and other interior counties. The question of what is regarded as a normal crop is hard of determination for the reason that certain sections "normally" bear more than others, probably largely on account of climatic differences. Certain it is that growers in certain localities of the interior counties in general would do little complaining if they could see as much fruit on their trees as is now on most of the trees in some of the coast counties.

Nevertheless there is a general complaint that there has been a heavy drop all over the state and the question in the minds of many growers is as to what caused the heavy dropping of the fruits during the last month. It can hardly be attributed to hot, dry weather, at least in Southern California, for as stated above we have had no such weather, until quite recently. The answer to this question is that apparently the heavy shedding in the last month is due to the fungus Alternaria. Practically all of the fruits shed during that period if cut open will exhibit a dark, discolored area under the navel end which usually indicates Alternaria infection. In Bulletin 290 of the Experiment Station it was pointed out that most of the late shedding, involving fruits of an inch or so in diameter, is associated with infection by Alternaria citri, which also causes black rot in those oranges which manage to hang on the tree to maturity. It was stated that ordinarily this part of the drop is of relatively little importance but that Alternaria infection was large in 1916. Climatic conditions this last spring have been very favorable for Alternaria infection and apparently we are having another season similar to that of 1916 but even more propitious for the growth of the fungus.

Citrus Trees With Heavy Green Manure Crop

Green manure crop planting time will be here within a few weeks. Besides affording humus, green manure crops have cover crop value.

So far nothing is known concerning methods of combating this fungus. The probable nature of infection either through the style of the fruit or by way of the ragged navel end after the style is shed, makes control by spraying of doubtful effectiveness. Cooperative spraying experiments carried out last season have shown no measurable effects, although it should be stated that the 1917 season was not favorable for Alternaria.

Summer Cover Crops

The writer recently made a trip through Kern and Los Angeles Counties checking up on the results obtained by the use of summer cover crops. He is very glad indeed to report that in Kern County, where the June drop occurs every year and is usually due to harsh climatic conditions, in every case observed where summer cover crops were put in and cared for properly the crop this season will be at least twice what it normally is. In some cases the increase will be even greater, as much as three times a normal crop, whereas where no summer cover crop was grown prospects are no better than last year. The most satisfactory cover crop used seemed to be a mixture of 12 pounds Melilotus alba and six pounds vetch planted in February. The indications were that the melilotus alone would have been better. A number of citrus growers in Los Angeles County planted summer cover crops of buckwheat this spring in April. Although weather conditions in Southern California and in Los Angeles County in particular were not conducive to a water-relations drop this season, still in every case observed where the cover crop was put in right and properly irrigated the amount of fruit on the trees will average higher than that on adjoining areas. Notice the fact that the word average is used. There are some groves without a summer cover crop which have been well cared for and fertilized and which aparently have about as much fruit. But the average, other conditions being equal, is in favor of the orchards with the summer cover crop.

But by a summer cover crop the writer does not mean a crop of Blackeye beans or Lady Washingtons planted in May or June. He means a thick growing crop planted so as to be up and covering the ground somewhat by the early part of May.

Extra Water Necessary

No occasion should be lost to give a word of caution concerning the growing of summer cover crops for the control of the June drop. The grower must have enough water for both crops and be able to apply it as often as needed. This means he probably will need at least four miners' inches for each ten acres. In addition the crop must be planted as early as possible in order to get it up and covering the ground before hot weather sets in. Since the water supply in Southern California is limited and the cost high, it may not be and probably will not be possible to grow summer cover crops in certain sections. However, the grower can accomplish a good deal toward obtaining good crops by keeping up his soil fertility. It has been repeatedly demonstrated that plants on a poor soil will require considerably more water than plants on a soil where the fertility has been maintained. The trees must not be allowed to suffer for water and one way to prevent this is to keep their water requirements as low as possible by maintaining the fertility of the soil. Of course summer cover crops may be expected to have no effect in preventing the Alternaria drop.

Some effort has been made to assign the shedding of lemons and Valencia oranges to the same causes operative in causing the June drop of navel oranges. The writer cannot bring himself to agree entirely with this idea, but recognizes the navel orange as in a class peculiar to itself. The navel orange variety is one of the most unstable and erratic fruit varieties we have. It is extremely prone to bud mutation and gives rise very freely to teratological forms. In fact the fruit itself is a monstrosity, consisting of a secondary fruit, the navel, partially enclosed within the primary seedless fruit. Moreover it possesses some indications of hybrid origin among which are lack of viable pollen, degeneration of a large proportion of the ovules, and susceptibility to shedding of the flowers and young fruits.

Lemons and Valencia oranges ordinarily possess some seeds whereas the navel is practically always seedless. There is a belief among growers, based on how much fact we do not know, that the shedding of such fruits is largely confined to those possessing few or no seeds. Heinicke of Cornell has shown that such is the case with the June drop of apples. There are a few navel trees of a different strain from the Washington navel which normally do produce some fruits containing seed. There is some evidence to show that in the case of these trees shedding is largely confined to the seedless fruits, the fruits containing seed remaining to maturity. But be that as it may, the fact remains that the Valencia crop of last season was about 65 per cent compared to 15-20 per cent for the navel, while the seedling crop is estimated at 100 per cent. Moreover in the laboratories of the division of agriculture the writer has shown that when subjected to precisely the same stimulus, navel flowers are shed in 48 hours, Valencia in 72 hours, and Eureka lemon in 144 hours, showing a great difference in susceptibility to the same abscission stimuli.

It is needless to say that trees which have been neglected or which are diseased cannot normally be expected to set a satisfactory crop. However, in orchards where the best of care is given and the trees are strong and thrifty, this June drop phenomenon occurs and it is this phase of the June drop which is referred to in this article.

BLACK BEETLE, FRIEND OF BEAN GROWERS

Cheering news for bean growers of Ventura County comes in the announcement by County Horticultural Commissioner A. A. Brock that he has discovered a black beetle which is feasting on the corn worm, which has been doing such serious damage in the bean fields.

"The beetle," says Mr. Brock, "multiplies rapidly, and is present in many of the fields now suffering from the worm." Hundreds of lanterns, forming moth traps below which the moths drown in a pan of oil, are burning every night throughout the county. Some sections look as if illumined for a fete. Spraying is only partially successful, as the worms are in the pods, which lie on the ground and are so covered by the beavy foliage that the spray does not reach them.

After all, the great mass of the people are sane and steady. Only a few at each extreme are making the troublesome noise.

Agricultural News Notes of the Pacific Coast

Northern California

Gridley has been shipping peaches, Tuscan clings. Growers are getting $50 a ton.

Prospects are good for a big rice crop in the tule district of northeastern Yolo.

The old Griffin-Skelley packing house at Chico is being remodeled to be used for packing prunes and peaches.

Sutter County reports "most of the prunes in this locality sold"; "dried Muir peaches, top price 11 cents per pound."

Chico reports the present year's output of prunes will be the biggest ever for that district; it will be not far from 3,000 tons.

Lincoln, Placer County, reports grain being brought in at the rate of 750 bags a day. That vicinity will furnish 50,000 bags.

Owing to irrigation water being shorter than usual, many Sacramento Valley people who are situated so they can will grow fall potato crop.

The weather bureau is aiding in fire patrol work by sending out to post offices notices immediately upon the discovery that a north wind is coming.

The Women's Liberty League of Yolo County has started a food conservation campaign in the nature of practical vegetable drying demonstrations.

Sutter County reports the peach crop ripening slowly on account of cool weather. A few clings have been marketed but other varieties are not ready.

C. C. Moore, recently elected member of the council of defense, is soon to name a committee of farmers and stockmen to promote a straw conservation campaign.

Glenn County farm bureau meetings: Larkin, July 26; Bayliss, August 2; Ord, 7; Jacinto, 9; Codora, 12; Orland, 14; directors' monthly meeting held at Willows last Saturday.

California rice growers have agreed to submit price adjustment to State Food Commissioner Merritt, notwithstanding they feel the situation favors the rice growers of the Southern States.

Due to the concerted action of the government the state foresters and the weather bureaus, the number of fires in the grain fields of California have been reduced 50 per cent this season.

Farm Adviser Stiles of Sutter County with a party of other agriculturists recently visited the big new grain elevator at Hamilton City, Glenn County. The elevator has capacity of 60,000 sacks.

Members of the Placer County farm bureau have organized The Farmer Lime Company, which announces that it will have pulverized limestone ready for delivery on August 1. Price announced is $2.25 per ton at quarry, or, delivered, 25 cents per ton mile, on board cars Newcastle, $4.00.

As a result of a final conference between the directors of the Pacific Rice Growers' Association and the federal food administration, California rice growers will receive a maximum of $4.32 per 100 pounds, instead of $4.16 2-3 as originally provided in the agreement the association was requested to sign.

Central California

Grasshoppers have damaged the grain crops in Merced County.

Active buying of raisins, prunes and peaches is reported from the valley.

Growers are to get 6¾ cents for Thompson Seedless, 5½c for Muscats.

Fruit growers and shippers met in Lodi July 20 to discuss problems of standardization of pack.

The Alfalfa Growers' Association is now conducting a membership campaign in Merced County.

The army worm which was seriously threatening vineyards in Tulare County has disappeared.

The food administration has announced the retail price on rice at approximately 11 cents.

Berry men of Santa Cruz County are considering discarding chests and adopting free containers.

More than 5000 acres of alfalfa land in Tulare County have been pledged to the Alfalfa Growers Association.

The San Joaquin Valley Dairy Producers' Association held a meeting in Merced, July 27, to secure members.

A sale of 164 hogs was made by the Tulare County farm bureau July 18. Fifteen and one-half cents per pound was received.

Monterey County cattlemen are contemplating a scheme of chain cattle sales; this for both feeders and fat stock.

The food administration has requested canneries not to admit visitors to any part of factory where food products are being packed.

It is reported that Chinese pheasants are playing havoc in melon and vegetable patches of the Westfield district of Tulare County.

Mrs. Ruby Nickerson, a rancher near Merced, has arranged for a unit of 20 young women of the Women's Land Army to harvest her fruit.

The farm home department of the San Joaquin County farm bureau has 231 members in Lodi, 36 in Escalon, 25 in Manteca, and 14 in Lockeford.

Farm Adviser Jungerman of Stanislaus County is endeavoring to interest the farmers in pooling their wool clips for sale to the government.

Mrs. J. L. Carver of Tulare County has disposed of her cattle ranch in the White River foothills of which she has maintained personal management for many years.

Pear growers are relieved over securing an increase in their contract price. Ten dollars will be added where this does not bring the new price over $47.50 per ton.

Grain fields in the Tulare section were fired in a very peculiar manner last week by the dropping into the dry fields of the blazing bodies of birds which flew into high tension wires.

Land owners in the west side section of Merced, Stanislaus and Fresno Counties are petitioning for the formation of a great irrigation district to include a half million acres.

Dr. Kelly of the University of California has been sent to the Tulare citrus district to study cultural methods. The expense of conducting the work will be borne jointly by the university and the orange growers.

Southern California

Liquid hydrocyanic acid gas fumigation is growing in popularity.

Apricot pits are commanding $45 per ton; kernels eight cents per pound.

Los Angeles County farm bureau center meetings; Lankershim, August 1; Puente, 1.

The Hemet-San Jacinto Growers' Association includes most of the apricot growers of the valley.

Northern San Diego County has a chamber of commerce which looks after the productive interests.

Orange County's sealer of weights and measures is making the rounds of sugar dumps and factories testing the scales.

Ground has been broken for a number of buildings for the first Liberty Fair which will be held in Los Angeles, October 12-26.

Corona, Riverside County, has a 20 acre rabbit ranch financed by Los Angeles capitalists. It is to have a capacity of 10,000 rabbits.

Seizure was made last week of five bags of sugar in the basement of a Pasadena building, supposed to be a personal hoarding stunt.

The Ventura County farm bureau is carrying on careful work in bean selection, not only of limas, but of all varieties grown in the county.

The campaign for lower priced fish is still on in this section. It is being conducted by D. B. Lyons, deputy of the state market commission.

Lukens Peak is a name chosen by the forest service for one of the higher peaks of the Sierra Madre; this in honor of the late T. P. Lukens.

The tuna packers are again breaking the record with an enormous pack. It is to be hoped that consumers will get some benefit from lower prices.

Ventura bean fields have been suffering severe damage from the corn worm. It is now reported that a black beetle has been found which feeds on the worm.

Directors of California Prune and Apricot Growers have announced 1918 prices: Standards, 9½ cents per pound; choice, 13 cents per pound; fancy, 16 cents per pound; extra choice, 14½ cents per pound.

The farm bureau of Ventura County is considering taking up a series of tests on extermination of morning glory by chemicals along the line of experiments conducted by Prof. G. P. Gray of the state university.

Ventura County is appealing to the state agricultural college and the department of agriculture for aid in controlling wire worms and other insect pests which have been worse this season than any previous year.

It is stated that there is now in Southern California an 18 per cent carry-over of beans. Growers point out that last year's importation of oriental beans was more than the 18 per cent now on hand, and if they had not been brought in there would probably be no carry-over at this time.

Supervisors of San Bernardino County have appropriated a special fire fund of $2900, to be used to keep fire out of canyons which deliver irrigation water and to provide trailers and other fire-fighting equipment for use of the volunteer fire-fighting companies which will protect the county's grain fields and forage crops from fire.

The Coast and General

Greece reports prospects for a good olive crop.

Arizona will ship about 200 cars of watermelons as against 150 last year.

A $16,000 elevator is being erected by the farmers of Toppenish, Washington.

Montana has placed a qarantine on hay from several districts of Utah, Idaho and Wyoming.

The United States government has awarded contracts for 30 steel cargo ships to Japanese ship yards.

Merchants of Vancouver, Washington, refused to sell flour to strangers or other than regular customers.

Snohomish County, Washington, is shipping potatoes to British Columbia for manufacturing into potato flour.

The war department is calling for supplies of walnut wood for use in making airplane propellers and gun stocks.

The department of labor states that food prices throughout the country have advanced 63 per cent in five years.

Algeria, in northern Africa, is making plantings of carobs for stock feed. Both carob and olive trees grow wild in that section.

Large deposits of nitrate of soda have been discovered in Amargosa Valley, Inyo County, near the Tonopah & Tidewater railway.

New York City is to have a drayage director who will make an effort to decrease the congestion and make proper transfers.

Good grazing land in Northern Mexico has been stripped of thousands of head of cattle because of high prices inducing early selling.

The order prohibiting sending parcels to Americans in the armies overseas except on direct request of the men does not apply to men in the navy.

Women of Uinta County, Utah, under supervision of a federal home demonstration agent, are making quantities of beet sugar and potato starch.

The International Apple Shippers' Association will hold its 24th annual convention in Philadelphia, August 14-16. An apple show is to be held in connection.

Idaho, Utah and the Northwest sugar producing sections will have a material reduction of their beet sugar output because of unfavorable weather conditions.

The United States shipping board has ordered that hereafter all camouflaging of ships built for that board will be prescribed and supervised by the navy department.

Great Britain has imported 8100 motor tractors for agricultural use and orders are outstanding for 5500 more. Before the war Great Britain produced only about one-third of the breadstuffs consumed. From present indications she may end the war by being self-supporting.

The Cultivator some weeks ago gave an interesting item as to methods of making coconut butter in the Philippines. "The Agricultural News of Barbados" now states that the manufacture of coconut butter as a substitute for the real thing is now being taken up on a commercial scale on the island of Trinidad.

Santa Barbara Community Dryer and Cannery

By W. V. Cruess

THIS is a continuation of Mr. Cruess' article, the first section of which appeared in last issue. In that article he touched upon the need of conserving the large surplus of war garden material, which was appreciated by the people of Santa Barbara. The building, plan of which was given last week, was constructed through the use of funds subscribed by the community. The plan of the dryer, the drying tunnel, the fan and air heating apparatus, with illustrations showing method of construction of heating coil, were all features of that article.

* * *

The trays that are used are so constructed that they allow free passage of the air through the dryer. The dimensions and general design of the trays can be see from Figure 6. The trays are 36 inches long by 34 inches wide. The sides consist of two strips 2 inches by 1 inch. These sides are held in place by crosspieces at the end and top of the sides, 2 inches by ⅝ inch and three strips across the bottom, 2 inches by ⅝ inch. The bottom of the tray is made in most cases of ¼-inch galvanized wire cloth. The wire cloth or screen is turned up at one end so that when the trays are placed in the dryer this end would be turned toward the fan. This is desirable because the blast of air tends to draw the dried vegetables off the trays. The turned up screen will hold them in place. The other end of the tray is flat to minimize air friction. For finely shredded vegetables and peas, the size of the screen should be reduced to 1-7 or 1-8 inch mesh.

The trays are placed in the dryer on small trucks. The frame of the truck consists of 2x4's and is 36 inches long by 34 inches wide. Castors are placed in the centers of the four sides. The castors are 2½ inches tall. Two of the castors are on swivel pivots to permit turning of the trucks. The trucks are equipped with two eyes and a detachable handle so

Fig. 7. Blanching Vat

that they may be drawn conveniently. Each compartment of the dryer will hold 17 trays stacked on a truck. (See Figure 3, Page 75 last week).

Preparation Tables

There are four large tables, 10 feet by 30 inches by 30 inches. Two of these are used for the cannery and two for the dryer. The material to be dried is prepared on these tables by peeling, slicing, etc.

Blanching Vat

Most vegetables must be parboiled before they go into the dryer. For this purpose, a circular galvanized tank, 29 inches deep and 25 inches in diameter, has been placed near the preparation tables. The water used for parboiling is heated by a direct steam jet which is let into the tank from the main steam line. The general appearance of the blanching vat can be seen in Figure 7. A galvanized screen basket is used to hold the material being parboiled. The figure shows the general construction of this blanching basket. It is approximately 18 inches in diameter and about 24 inches deep, made of ¼-inch mesh screen, reinforced with strips as shown in the photograph. The blanching basket is raised by a small hand-power crane. In addition to the blanching tank, a tank of smaller size and construction has been mounted on a small truck for chilling and parboiling the material before it is placed on trays. This second tank is filled with cold water for chilling purposes.

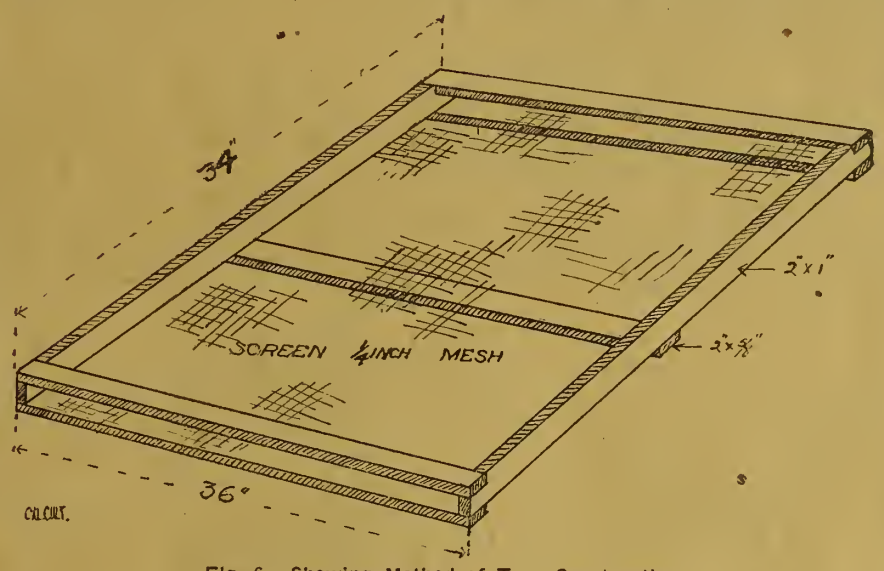

Fig. 6. Showing Method of Tray Construction

Washing Sinks

At one side of the room have been placed two sinks, 20 by 72 inches and 9 inches deep. These are for washing the vegetables before peeling and slicing.

Sulfur

For the sulfuring of fruits, a small sulfur box of the hood type has been constructed of light frame covered with heavy building paper. The box is approximately 56 inches long, 40 inches wide and 60 inches tall. It has handles at the four corners. It is used by placing it down over a stack of 15 or 20 trays. The trays are stacked on the ground near the building and the hood is raised by two workmen and set down over the trays. The sulfur is burned in a pan in a small hole dug in the ground at one end of the hood. This hood is used for such fruits as pears, peaches and apricots, but no vegetables are sulfured.

Storage Bins

To hold the dried vegetables during the conditioning or "sweating" process, eight small bins have been built along the south wall of the building. These bins are about 4 feet in depth at the back and 3 feet in depth at the front, with a slanting door on the top of each bin. The bins are built of tongue and groove and are made as nearly insect tight as possible.

Vegetable Slicer

A small vegetable slicer, capable of handling several tons of vegetables per day, has been mounted on a small table. The appearance of the slicer can be seen from Figure 8. The

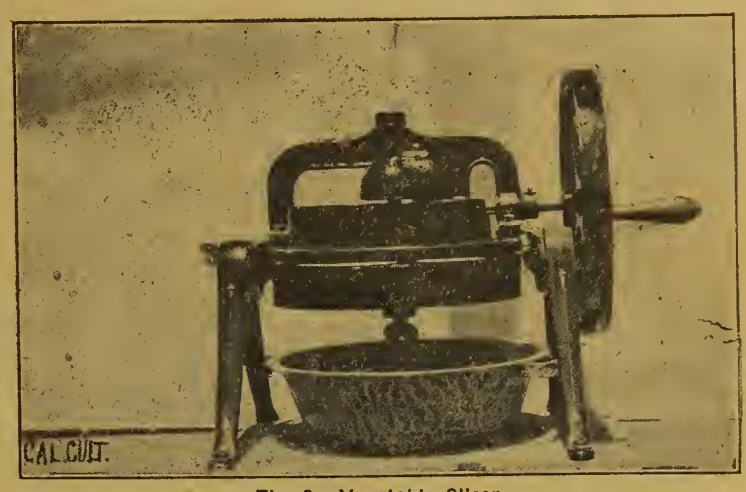

Fig. 8. Vegetable Slicer

slicer is known as the Sterling Slicer Number 40, and is one that has been found very satisfactory for small dryers. It has an adjustable rotary blade which can be set to slice the vegetables to any desired thickness up to about one-half inch.

Miscellaneous Equipment

In addition to the equipment described above, there have also been provided peeling knives, peach pitting spoons, a number of dishpans of moderate size for holding the peeled or sliced products, and several fiber tubs of about 15 gallons capacity. Garbage cans must be provided for caring for the vegetable tops and waste. Pots and buckets of various sizes have also been provided for general use.

Containers

The dried products are to be packed in parchment paper bags inside light cardboard cartons, similar to the ordinary raisin carton. These cartons will be of various sizes, according to the product.

Organization

The association operates under the name of the Community Drying and Canning Association. C. W. Kirk is general manager, and Mayor H. T. Nielson is president. R. T. Stevens is the secretary. F. P. Knott, Mrs. F. P. Knott, Miss J. Wade, and others have been very active in the organization of the dryer and are still closely connected with its activities. The actual operation of the preparation and drying of the vegetables is superintended by Miss Sentell. The labor necessary for operating the dryer is furnished by voluntary workers of the community. Each day's work is done under the supervision of some lady who acts as captain for the day. The women in the community have offered their services free of charge in a very commendable and patriotic spirit. The produce is dried for the grower at a fixed charge per pound of fresh material, which is just large enough to cover the actual cost of drying. No profit is made in operating the plant. Many of the growers have donated their produce to the association. This will be dried, put in cartons, and sold to cover the cost of the drying and packing. In other cases, the grower brings in his or her produce, prepares it, and the association dries it at cost. In such cases, the charge made is somewhat less than where the association carries out all of the labor. The underlying plan is to save the surplus and not to make a profit. During the next season it may be possible to enlarge the plant sufficiently to warrant its contracting for the planting of sufficient ground to operate upon a commercial basis.

Drying Various Products

It may be of interest to outline briefly the processes used in the drying of several of the more important vegetables and fruits.

1. Potatoes: Potatoes are washed and peeled by hand. A knife known as the Pomona peeling knife has been found very satisfactory for this purpose. Potatoes may be peeled mechanically by the peeler shown in Figure 9, but this peeler wastes 35 to 40 per cent of the weight of the potato, while hand peeling gives a loss of only 10 to 15 per cent. The peeled potatoes are kept under water until they are sliced. This prevents darkening. The potatoes are then sliced to a thickness of about 3-16 of an inch —something less than ¼ of an inch. They are then placed in the blanching basket and immersed in boiling water for about three minutes, just long enough to heat the slices through but not long enough to make the potato mealy or soft. This heating process destroys the oxidizing and coloring matter which would otherwise darken the potatoes. The heated potatoes are then spread on trays to a depth of about two slices. They are spread evenly so that air spaces are left between the slices for the passage of the air blast of the dryer. Po-

tatoes dry rapidly and in about six hours at 130 degrees F. they become crisp and dry. When they are brittle and hard, they are considered finished.

2. String Beans: The strings are removed from the beans and the pods are broken into lengths of about one or one and a half inches. They are washed thoroughly and blanched in boiling water for about five to seven minutes, depending upon the maturity of the beans. They are spread at once on trays to a depth of about two pods. It takes about twice as long to dry string beans as it does potatoes. The color of the beans is improved if about half an ounce of baking soda is used per gallon of water in the blanching vat. This seems to set the color and to darken it. The beans are dried until brittle.

3. Peas: Peas are shelled, blanched for three to five minutes, and are spread on trays and dried in the same way as described for string beans. Peas dry more rapidly than do string beans.

4. Carrots, Turnips, and Parsnips: Peel. Shred or slice into thin slices. Parboil five minutes. Spread on trays and dry until hard and brittle. 150 degree F. can be used safely.

5. Onions: Remove the outer dry husks. Cut into thin slices. Dry until brittle, preferably below 140 degrees F.; finish drying at a moderate temperature to avoid darkening. Remove as soon as dry because they will darken rapidly and lose flavor by overdrying. Do not parboil onions before drying.

6. Spinach, Chard, and Other Greens: Wash, trim, or discard defective leaves, spread on trays, and dry at 110 to 150 degrees F. Greens are not so easily injured as other vegetables by overheating.

7. Cabbage: Slice thin and dry at 110 to 150 degrees F., without other treatment.

8. Corn: Husk and remove silk. Immerse on the cob in boiling water for ten minutes. Remove, chill in cold water, and slice from the cob on trays. Dry at 110 to 150 degrees until "bone dry."

9. Squash and Pumpkin: Peel, cut in thin slices, dry without parboiling.

10. Other vegetables may be dried in their natural state if they are sliced to facilitate drying.

In general, the quality of the dried product is better when the drying has been carried out at moderate temperatures rather than at high temperatures. A temperature above 150 degrees F. is considered by most authorities as too high for the production of a product of good flavor. Temperatures as low as 100 to 105 degrees F. are used in some dryers, though the production of dried vegetables of the highest flavor and general quality can be obtained by the dehydration process at 110 to 130 degrees F. Temperatures to 140 degrees F. can be used in safety for the drying if the drying is not carried on too quickly after the product has become brittle.

Fruits are dried in the evaporator after a preliminary treatment practically identical in all respects with that given in the ordinary sun drying establishments in California. Apricots are cut in half and sulfured for from two and a half to three hours. Peaches are peeled and sulfured as in ordinary dry yards. Pears are cut in half and sulfured for four hours before drying. Fruits are started at a moderate temperature, 110 to 115 degrees F., and are finished at a higher temperature. By starting at a low temperature, the tendency of the fruit to sweat and lose juice by dripping is avoided.

Fig. 9. Vegetable Peeler
Fig. 10. Sterilizers

Storage of the Dried Products

The dried fruits and vegetables are allowed to sweat and condition in bins for several days and are then placed in insect-proof containers. Those who take the dried products home with them from the dryer place them in fruit jars or tin air-tight cans. Where the dried product is to be sold by the association it will be placed in cartons.

Cooking Dehydrated Vegetables

The dehydrating process removes the water only from the vegetables, together with a small amount of flavor. If the vegetables are soaked in water for from eight to fifteen hours, usually over night, they will recover their original shape and color. This is always the first step in preparing them for cooking. The next step is usually one of cooking them for a shorter or greater length of time in the water in which they were soaked until they are tender. They may then be used in any way that fresh vegetables are prepared for the table. Potatoes may be fried after soaking and without the boiling process. They are then just as good as fresh potatoes for this purpose. Potatoes may also be mashed or creamed or prepared in any way except baking with the jackets on. The dried vegetables are in all cases already peeled, washed and sliced, ready for cooking, so that the labor of preparing fresh vegetables is avoided by the user. Dehydrated vegetables are somewhat lower in flavor than are the fresh vegetables. For this reason it is de-

AVERY
AVERY
AVERY

Light and Heavy Tractor Plows for all Size Tractors
Avery Motor Cultivator
There's a size Avery Thresher for every size engine

One Avery Sells Another

PROOF of Avery Tractor success is shown by the way Avery Tractor sales grow in the same community. When one farmer gets an Avery Tractor, his neighbors watch its work closely. It is not long before another Avery arrives and then another, for his neighbors see that Avery Tractors stand up under the work.

Likewise, when an Avery gets into a family, other members of the same family soon become Avery owners. Brothers, cousins, fathers and sons, uncles. and nephews are buying Averys. We have many records of where two, three and four brothers in the same family have bought Avery Tractors. The fact that neighbors, friends and relatives buy Avery Tractors after they have watched carefully the work of the first Avery Tractor in their community or family, is the very best proof that Avery Tractors are a success.

Power for Every Farm Need

You can get an Avery Tractor to exactly fit your size farm. Avery Tractors are built in six sizes—a size for every size farm. With an Avery Motor Cultivator you can also cultivate your row crops with motor power. You can also get a size Avery "Grain-Saving" Separator and Avery Plow for any size Avery Tractor. For any kind of field work, belt work or road work, there is a successful and profitable Avery Motor Power Machine.

Built by Motor Farming Machinery Specialists

The five sizes of Avery Tractors, from 8-16 to 40-80 H.P., are all of the same design. They have low speed motors, renewable inner cylinder walls, adjustable crankshaft boxes, gasifiers that turn kerosene or distillate into gas and burn it all, and many other original and exclusive features.

Avery Tractors are built entirely in our own big factories and every part of an Avery Tractor is built especially for tractor work and only for the Avery Tractor. Avery Company are *builders*—not assemblers.

See the Nearest Avery Dealer

Go to your Avery Dealer and get the size tractor and equipment to meet the needs of your size farm. No matter how small or how large the acreage you cultivate, Avery motor farming machinery will fill your requirements. Or, write for complete catalog, showing the Avery Line in natural colors.

AVERY
Motor Farming, Threshing and Road Building Machinery

sirable to add considerable seasoning. For this purpose, butter, milk, and various spices, and bacon and ham are very useful. The food value of the dehydrated vegetables is equal to that of the fresh vegetables, when they have been soaked in water to regain their original size. They are very much more concentrated than the fresh vegetables. One pound of dried tomatoes will equal twelve pounds of fresh tomatoes. One pound of dried potatoes is equal to about six pounds of fresh potatoes. The ratios for other vegetables range between these two in most cases. Some of the greens, such as chard, spinach, asparagus, contain even more water than do tomatoes. Farmers' Bulletin No. 841, U. S. Department of Agriculture, gives numerous recipes for cooking dried products.

Santa Barbara Community Cannery

In addition to the drying plant described in one of our previous issues, the community of Santa Barbara has installed a small canning plant to can such fruits and vegetables as are unsuitable for drying or which are canned at the request of the growers. This equipment is housed in the same building as that in which the drying plant is located.

Sterilizers

Two small sterilizers have been installed. One of these is known as a National Steam Pressure Sterilizer (factory size) and the other is known as a Hotel Size National Steam Pressure Sterilizer. These sterilizers would be used at the boiling point of water or can be used as steam pressure outfits for the sterilization of vegetables at temperatures above 212 degrees F. Figure 10 will give a general idea of the precise location of these two sterilizers. The sterilizers are operated by steam from the 15 h. p. boiler previously described for the use of the dryer. In addition to the 15 h. p. boiler, there has been installed a small 3 h. p. boiler capable of operating the two sterilizers at times when the larger boiler will not be in operation.

Blanching Tank

Vegetables are blanched for canning by immersing them in boiling water two to seven minutes. The blanching tank and basket previously described for the dryer are used also for the cannery.

Gas Range

A large fully equipped gas range with four burners and an oven was donated to the cannery by one of the prominent hardware firms of Santa Barbara (Ott Hardware Company). This is used for heating the syrups used in canning and for the heating of soldering irons and for other sundry purposes such as jelly-making, etc. It is a very useful article of equipment.

Containers

In most cases, cans are used—usually the solder top can which is sealed with a soldering iron, or the Sanitary Can, which is sealed with a small Burpee Handpower Capper. Number 2½ cans are used for fruits and Number 2 cans for vegetables. Glass jars are used in many cases for sterilization of fruit, but are not found very satisfactory for vegetables.

Sugar Supply

The cannery operates under a special license from the Food Administration and is permitted to buy and sell sugar directly to those who do their canning at the community plant. The sugar is sold at cost under the supervision of the Food Administration.

Organization

The produce is received and handled upon the same basis as previously described for the dryer. The grower of the fruit or vegetables is merely charged for the cost of canning. Where the material is donated to the association it is canned and sold to defray the cost of handling. As in the operation of the dryer the object is to save food and not to make a profit. Mr. Kirk is in general charge and Miss Sentell is superintending the actual canning operations. As nearly as possible, the methods applied are those recommended by the United States department of agriculture and by the University of California. The produce is all graded and put up in a standard manner so that it can be sold in competition with the commercially canned products. The cannery has a maximum capacity of about 3000 cans per day, which will be ample to cover the needs of the community for this season.

Why live stock prices go up and down

WHEN there is more dressed meat on the market than there is consumer demand for it, meat and live stock prices go down.

But when the consumer demand for meat is greater than the supply, meat and live stock prices go up.

This is the law of supply and demand. It is the law that determines the prices the producer gets for his cattle.

* * * *

Between the producer of live stock on one hand and the consumer of dressed meat on the other hand is the service of the packer.

The packer turns the live stock into dressed meat and by-products and then distributes them to the retailer.

Out of every dollar the packer receives for this meat and by-products he pays 90 cents, approximately, for the cattle.

The remaining 10 cents on the dollar must pay for dressing, freight to market, operation of distributing houses, and in most cases delivery to the retailer.

Out of what is left must come the packer's profit. For Swift & Company during 1917 this amounted to a net profit of ¼ of a cent per pound of beef. On *all* products, it was only a little over half a cent per pound.

A reasonable profit margin is necessary to enable the packer to operate without endangering the efficiency of the business and its value to the producer as a marketing agency for live stock. Complete elimination of these profits would have practically no effect on the farm prices of live stock nor the retail prices of meat.

Swift & Company will gladly co-operate in the carrying out of any national policy that will tend to steady the prices of live stock and meat.

Swift & Company, U. S. A.

A nation-wide organization with more than 20,000 stockholders

Great Conference to be Held in Riverside

By G. H. Hecke, State Commissioner of Horticulture

IN THESE days when every effort is being put forth to increase the food supply of the nation, the question constantly before us is, how can we best organize to increase our production of these articles? In this connection the most important factor entering into consideration, and one which is often overlooked, is, how can we best organize to prevent unnecessary losses? It is a well recognized fact that the annual loss to our food crops from plant pests and diseases equals about ten per cent of the total. A number of these pests are of general distribution, while others are more or less restricted. Among these may be listed some of our most destructive species. In a number of the Western and Pacific states the same crops are grown, thus making the interests of these states in this respect more or less mutual. Whenever some new pest appears in one state the menace becomes greater according to how near or how far distant it may be. At the present time when the success or failure of our efforts in connection with the world war depends largely upon our ability to produce sufficient foodstuffs to feed the nation, our investigations are not only bringing to light some of the shortcomings of the present system, but are also showing us the necessity of expanding and strengthening our organizations.

TEAGUE QUALITY
CITRUS TREES
AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.
For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

Port Inspection

One which is of particular importance is the subject of interstate quarantines. The Pacific Coast states and California in particular are forced to maintain the most rigid inspection service to protect the United States from undesirable plant pests and diseases of Oriental origin and have developed a highly efficient organization which meets the needs of the occasion. There is, however, a greater obstacle which is much more difficult to surmount. While we may be able to guard our front door, the back door is much more difficult to close. Each state makes its own laws and ordinances in regard to prevention and control of insect pests. These are naturally made without regard to the neighboring states which, figuratively speaking, are left to work out their own salvation. There are few who will not agree that on such problems in which the states are mutually interested uniform laws and ordinances will do much to make for a more efficient organization. They will also do much to simplify many of the present problems, particularly those dealing with preventing the introduction of new and hitherto restricted pests. There are at present a number of insect pests and plant diseases of foreign origin which have been introduced into the eastern part of the United States which if allowed to get into the agricultural regions of the West will cause great damage and necessitate the expenditure of large amounts annually in their control. If left to become distributed by natural means there are a number of agencies which will delay their arrival in this part of the country. Unfortunately, in these days of rapid transit the chances for distribution are greatly increased. Thus great distances can be easily bridged and constant watching of all of the avenues of trade is necessary to keep them out. There are certain cultural areas which are surrounded by natural barriers that act as checks to prevent the distribution of insect and other pests through natural agencies such as flying or crawling. Thus with proper restrictions and inspection of suspicious articles coming through the regular channels of trade the danger to be anticipated can be reduced to a minimum. With all of the Western states working under a uniform system the problem of the danger of introduction can be greatly reduced and the work would be largely simplified. It is to bring these states together that the California commission of horticulture is working.

To Perfect Better Organization

The first step in this direction will be to call together in conference the officials directly concerned with this work in each of the states. To this end the matter has been presented to the different officials and thus far the results have been very gratifying. All have recognized the advantages that would accrue from such an arrangement and have expressed a desire to do all they can to bring about such an organization. The conference has been set for the week of November 11-16, at Riverside, and it is planned to take up the horticultural quarantines now in force between the states represented; to devise and develop practical methods of executing the provisions of the same; to consider the necessity of issuing and putting into execution uniform quarantines against other insect pests and plant diseases that constitute a common menace to horticultural and agricultural industries; to perfect a permanent organization devoted to the prevention of increase in the cost of crop production by collective effort, to prevent the introduction and establishment in the several territories under our jurisdiction of any and all crop pests not yet in these regions, and to devise and adopt ways and means of preventing the further distribution of such as have unfortunately become already established.

Nurserymen Will Participate

The meeting, coming as it does during the same week in which The California Nurserymen's Association, the the annual convention of Fruit Growers and Farmers and the State Association of County Horticultural Commissioners meet at the same place, many opportunities will be afforded to discuss a number of points which are of mutual importance. For example, the nurserymen will have a chance to present the various features of their business which are subject to regulations by quarantines, etc., and will have an excellent opportunity to express their views and offer such suggestions which would improve the present systems. County horticultural commissioners will also have an opportunity to meet the officials of the different states with whom they have had considerable business in connection with plant inspection.

Federal Horticultural Board Interested

In addition to the above, the federal horticultural board of the United States department of agriculture in Washington has from the very first expressed a great interest in this matter and has promised to do all in its power to further and promote the aims of the convention. In order to be of the greatest possible assistance, Dr. Marlatt, chairman of the board, has advised us that he will represent the board in person at the conference and do everything possible to bring matters to a successful conclusion. With such an attitude prevailing toward the effecting of the organization which we hope to bring about, it would seem that if the proper officials can be brought together the success of our undertaking is in a large measure assured.

Cleveland Tractor

A Tractor That Does The Things You Want a Tractor To Do

The Cleveland Tractor is not confined to a narrow field of service. It does the things you want a tractor to do.

It plows, it harrows, it plants, it reaps. Its great power and small size enable it to work satisfactorily in difficult, awkward places. It works efficiently under and among small trees, close up to fence corners, around boulders, on hillsides, over ditches, gullies and rough ground.

With 600 square inches of traction surface, it goes through sand, gravel, gumbo, mud and even wet clay without packing the soil.

The Cleveland Tractor lays down its own tracks, crawls on them, and picks them up again as it goes along—just like the famous war "tanks."

It does *faster* and *better* work than was possible before. It plows 3½ miles an hour—eight to ten acres a day—equal to the work of *three* good men with *three* 3-horse teams under favorable conditions.

But the Cleveland is *far more than just a tractor.* With pulley and belt, it will saw, cut ensilage, pump—and do the things you demand of a stationary engine.

In addition it can be used for hauling the manure spreader, for grading, dragging logs and pulling road machinery.

It develops 12 horsepower at the drawbar and 20 horsepower at the pulley. Yet with all this power the complete machine weighs less than 3200 pounds, and can be housed in less space than is required for a single horse.

Rollin H. White, the well-known engineer, designed the Cleveland Tractor. It is built under his personal supervision, and is constructed for long service. The track sections are joined with hardened steel pins which have their bearings in hardened steel bushings. Gears are protected by dirt proof cases and are of the same high quality as those of the best trucks. The finest materials are used throughout.

Farming today demands the most comprehensive machinery obtainable—machinery that is useful in doing *many* different things—machinery that is adaptable to widely varying conditions.

Thousands of farmers are looking to the Cleveland Tractor in the present crisis. And the Cleveland is meeting the demands—severe as they are—and is *making more money* for its owners.

It is truly the tractor that does the things you want a tractor to do.

Nearly every farm can use one or more Clevelands to speed up production and cut down costs. Write *today* for complete information and the name of the nearest Cleveland dealer.

BEAN CUTTER

Catalog No. 281

Killefer Quality

Killefer Efficiency

There will be a big demand for Bean Cutters this year and when the time comes they will be needed quickly. Do not delay putting in your order now for what you need in this line, also for extra blades.

We build two weights of sled cutter, the one shown above being our regular wood frame cutter. For heavy ground where a stronger cutter is required, we make a steel arch frame at an additional cost of five dollars. Give your order to your dealer and insist upon having the Killefer Bean Cutter. Send for catalogue.

The Killefer Manufacturing Company

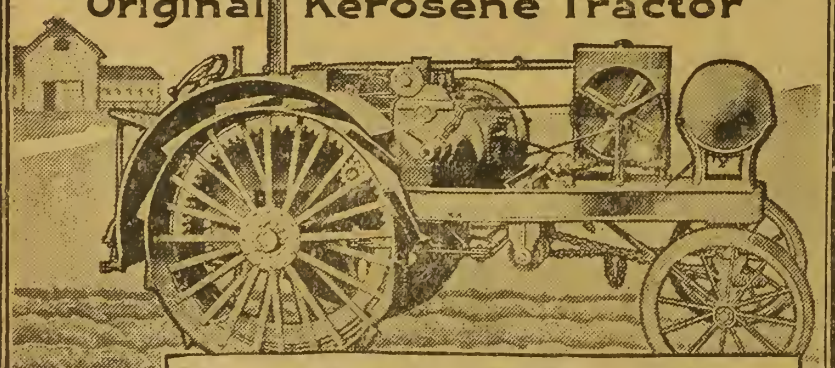
WATERLOO BOY

Original Kerosene Tractor



Speeds Up Work At Harvest Time

Waterloo Boy at Work

John Schoepf & Sons, Seward, Nebraska, write: "We plowed 42 acres with 60 gallons kerosene in 5 days; we shelled 18 loads corn in 2½ hours; we threshed 16 loads clover and alfalfa in 4½ hours with a No. 6 huller, the largest in this section. We think the Waterloo Boy as powerful and as cheap to operate as any tractor."

You need to do some fast work when your standing crops are ready to cut; and you can rely upon the Waterloo Boy one man, three-plow, cheap fuel tractor to make every minute count.

One man can harvest 25 acres per day with the Waterloo Boy and an 8 foot grain binder, or 10 acres per day with a corn binder—has a threshing record of 16 loads clover in 4½ hours.

Stands Severe Endurance Test

The Waterloo Boy motor has pulled a 25-H. P. load for 312 hours without stopping. A test run of eight months showed average kerosene consumption of less than 1½ gallons per hour.

As efficient in the field as at the belt—pulls three 14" bottoms in heavy soil, with ample reserve power. Light weight, large, wide wheels, with powerful quick-starting motor and easy control enable the Waterloo Boy to do good work "where heavier tractors would not dream of working," writes one owner.

Remember, the Waterloo Boy is made and backed by a responsible manufacturer, and has over four years' proven success to its credit.

Illustrated Catalog sent free, shows why thousands of farmers are buying the Waterloo Boy. Write for it.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Wry Tails in Pullets

I have several young Ancona pullets that carry a wry tail, presumably from some irregularity in incubator. Do you think these will lay as well as others?—B. A. R. S.

A wry tail disqualifies the bird for the show room, but otherwise does no harm whatever. Be careful, however, about using these wry-tailed pullets in the breeding pen. If you have one this year, you will have many more next year. Wry tails, like feathered legs, are congenital, and not due to any fault in incubation.—J. A. K.

Turks Have Indigestion

My young turkeys, three months old, seem perfectly well, but their droppings during the day are light and foamy; at night they seem all right. I don't feed them much of anything, and never have fed much, because they have the range of ten acres, part of which is in barley stubble and part alfalfa. What I feed is just a little milo maze morning and night and at noon cottage cheese. When small, and up to three weeks, I fed hard cooked eggs, onions, oatmeal or bread crumbs, chopped mustard and dock and cottage cheese. — Subscriber, National City.

I don't think you need worry so long as the droppings are normal at night. There is, however, a little indigestion from some cause or other, and it is well to remove the cause before it develops into something more serious. As your birds have good range, why not drop off the morning feed of milo? It may be that they are getting a little too much. Do you keep oyster shell or grit before them? Turkeys pick up grit and gravel if they are on the right sort of soil, but somethimes they need more than they will pick up. If cutting off part of the grain ration and providing shell does not rectify the trouble a dose of Epsom salts would do no harm. Mix it in soft mash (bran moistened with buttermilk is sufficient) about half a teaspoon to each bird, and give no more of the mash than they will clean up quickly. Doctoring is of little use with turkeys, but Epsom salts is a very harmless dose, and helps to clean out the intestinal tract if it is clogged.—J.A.K.

Lentils

Have noticed in your Los Angeles market page that lentils are priced at $24.50. Please advise me where I can get some for seed. What kind of soil is best for them and when is the best time to plant?—Subscriber, San Luis Obispo.

The lentil is grown to a very limited extent in this state. In January 7, 1915 issue of the Cultivator is an article written by a lentil grower, Mr. Igali, at that time editor of the California Hungarian Farmer. He took the ground that more should be grown in this state. At that time he was endeavoring to cultivate lentils on a 40 acre ranch near Santa Cruz. In the article he said: "Beans grown in this vicinity sold for 3½ cents, lentils ten cents, while the expense of raising the two crops is practically the same. Beans produce 1200 to 1400 pounds per acre while lentils may come up to 1000 per acre." (We judge that a thousand pound crop of lentils can be produced only by the experienced grower. — Ed.) "Lentil straw makes excellent livestock food." The culture given by Mr. Igali consisted of fall plowing, shallow spring plowing, seed in drills two feet apart. The principal lentil growing sections of Europe are on light volcanic or ash soils. As to seed, any seed house will probably be able to secure it.

Laying Out Grounds

Will you tell me where I can obtain the proper information about a home orchard and the laying out of grounds for a modest little home on a 30 acre place?—Subscriber, Modesto.

The inquirer does not say as to whether these grounds are for home use with the ornamental entering largely into the plans, or whether the commercial side is also to be considered. If it is just simply the landscaping or beautifying of a home place then landscape architect should be consulted and all conditions should be given to him. If, on the other hand, some fruits from which income is expected are to be planted, then one versed in the fruits of the section in which the land lies should be secured. The fruits of course should be chosen according to the demand of the market and opportunity of selling. We believe that the University of California has a department of farm management which might give advice in such a case.

Hogs per Acre

What are the usual terms for rental of hog ranch? About how many pigs could be raised on 100 acres of sandy alkali ground well fenced that will raise fair beets, corn, alfalfa and barley and has limited amount of water for irrigation, near the Coast?—Subscriber, Oxnard.

This matter of rental, especially of improved ranch which is to be stocked up, is almost impossible to give any idea about without knowing some of the factors such as fertility, distance from market, improvements, class of stock, etc. Naturally livestock farming gives to the tenant an advantage because of the fact that the fertility of the farm is increased in this form of farming. Regarding number of hogs per acre, this like the other question, calls for knowledge of conditions and especially one condition not mentioned in the question, that of experience and ability of the tenant to produce good crops if given right conditions. But here are some figures given in "Swine in America" by Coburn which are very illuminating as to stock on land. One basis of the comparison is that four pounds of grain or 15 pounds of green alfalfa will make one pound of pork. Then the author estimates that one acre of grain will produce 15 bushels of wheat which will produce 225 pounds of pork. An acre in barley will produce 35 bushels which will produce 420 pounds of pork. An acre of oats, 40 bushels, 330 pounds of pork; corn, 40 bushels, 560 pounds of pork; green alfalfa, 10 tons, 1333 pounds of pork. From this it is seen that one acre planted to wheat would only produce about one hog a year to alfalfa's five or six hogs. These figures were taken from Eastern conditions. California soil and irrigation water would mean greater production, and the number could be increased. As to how many hogs 100 acres will care for, no one can say without knowing more of soil, climate, water and personal conditions.

TWO POUNDS APIECE A MONTH OF SUGAR

The American public is now asked by the food administration to go on a sugar ration of two pounds per capita monthly, beginning August 1, to meet a world shortage and to care for the immediate demands of the military forces. The American public at present is on a three pounds per capita ration monthly.

Household rationing is to be voluntary, as at present, but public eating places will be required to observe new regulations effective August 1, permitting the use of two pounds of sugar for every 90 meals served.

Unless the consumption of sugar is reduced, both by householders and the public generally, the food administration warns, supplies for Belgium, the Red Cross, Y. M. C. A., Knights of Columbus, Salvation Army and other organizations working for the welfare of American military forces in Europe cannot be maintained.

The sugar situation confronting the United States is described by the food administration as follows:

Sugar supplies throughout the country, in homes, stores, factories and bakeries, are at low ebb; productions from the American beet and Louisiana cane crops have been disappointing; the yield in Porto Rico has likewise been smaller than anticipated, and the inability of the United States and the Allies to secure sugar from Java and other distant sources, on account of the imperative call for ships for the movement of troops and their supplies, has materially reduced the supply from such quarters.

Added to this already difficult situation, the quantity needed by the army and navy greatly exceeds earlier estimates. We must send a large amount to France and Italy to take the place of the great volume lost through the German and Austrian invasions, during which much beet land was overrun and many factories destroyed; we have to supply certain quantities to neutral nations under agreements; and finally, over 50,000,000 pounds were lost recently through submarine sinkings off our Atlantic coast.

"In asking the public voluntarily to reduce their consumption to a level more nearly equal to the compulsory restrictions in effect in France, England and Italy, the statement says that while sugar is often used as a luxury in America, it has become an essential element for the success of the war among nations of Europe.

"Upon our action here," the statement continues, "depends the possibility of maintaining the ration to our own fighting men and those of the Allies, as well as of avoiding a still further reduction of the allotments to the civil population of the nations fighting Germany which are already down to a point far under their normal needs."

To assure equitable distribution of the sugar the American public is to be allowed the food administration has worked out a scheme of allocation to the states based on population and the needs of the sugar-using industries in the states. Each state food administrator will be in charge of the distribution in his state.

FOOD BOARD GIVES PEAR GROWERS $10 TON EXTRA

Pear growers of California being obliged on term contracts to deliver their crops will receive an increase of $60,000 in the price as a result of a conference held between the packers and growers and H. Clay Miller representing the United States food administration for California.

Because of the increased cost of labor and material it was unanimously agreed that all term contracts for delivery of the 1918 crop will carry a price of $10 per ton in excess of the contract price, provided, however, that such $10 increase does not carry the total price above $47.50 per ton. This figure applies to the regular contract fruit, but prices affecting special sizes are to be settled separately in general accord with the adjustment made on the regular contracts.

Autoloading *and*
Pump Action Repeating Shotguns
for Shooting Right

WHEN you throw off *your* harness, and grab a shotgun for a good old-fashioned hunt, you are going to want *the run you have coming to you.*

Choose either the Remington UMC Pump Gun or Autoloading Shotgun and you will be on the *right* track. Among modern firearms they are the leaders in the shotgun class—leadership backed by the Grand Prize gold medal, highest possible of honors "For Modern Firearms and Ammunition," awarded to Remington UMC at the last World's Fair, in San Francisco. Vegetable Planting Calendar for August in Northern California

Written for California Cultivator By A. R. Gould

QUITE a few root crops will be ready to store this month and there should be a surplus maturing every month from now on if the successional method as advised in these notes has been strictly carried out. As the crops from each sowing mature, and after the family needs have been supplied the remainder should be stored away in dry sand in the basement or in a dark shed under the dry storing method and if the roots are carefully buried in layers in the sand they will keep perfectly and will supply the family for the winter, furthermore it is the duty of every grower to lay in storage a good supply of home grown vegetable roots as the more you become independent and self supporting from a food supply standpoint the more food Hoover will be able to supply our allies and help to shorten the war.

Irrigation will of course be the controlling factor in further production. Frequent hoeing will also do much to conserve moisture and the extra work will more than repay. Keep busy with conservation methods especially through the corn, beans, tomatoes, beets, carrots and turnips.

Cabbage and Cauliflower

Sturdy plants of these should be planted out this month, and they should be given plenty of water for the first month or so to encourage rapid growth. If they are neglected in the early stages of their growth in this respect they will be doomed.

Kale and Brussels Sprouts

Plants of these should be put out in well prepared ground at the end of the month and planted 18 to 24 inches apart to allow room for development. With regard to water the same remarks noted above for cabbage will apply.

Parsley

Make a sowing of the moss curled variety for winter use.

Tomatoes

Black fly has been very troublesome to this crop and they also seem shy at setting fruit. We may however, have more favorable weather for this crop this month. When watering, keep the spray from the flowers as this will injure the pollen. In fact, great care should be exercised in watering, and if the plants have become well established cultivation with the hoe around the roots should be sufficient and will have the desired effect. Gently shake the plants to assist pollination.

Leeks and Celery

These should now be making strong growth, and during this month an application of liquid horse or cow manure should be given. It is essential that an ample supply of water be given.

Radish

On a well manured border sow the winter varieties of radish; Chinese White Winter, Long Black Spanish and Rose Winter are all good. White Strassburg is also excellent for late summer use and should be sown now.

Turnips

For winter use sow Purple Top White Globe and Purple Top Yellow Aberdeen which is a fine keeper and also of great value for stock feed. Seed of these should be sown very thinly.

Potatoes

During this month the all important potato crop will be ready to dig, and every care must be taken not to injure the tubers. Furthermore, when the work of storing is undertaken every tuber should be examined to see that it is free from fungus disease. Allow them to dry out thoroughly before placing in storage.

Carrots

Sow Danver's Half-long for winter use. It is a good all round variety and fine cropper. A successional sowing of French forcing may also be made.

Lettuce

Sow Iceberg or May King and White Paris Cos to keep up the supply for late fall use. Thin the seedlings early and avoid sowing too thickly.

Beans

Make a sowing of Extra Early Refugee and Early Long Yellow Six Weeks. This will be the last chance, and an extensive sowing should be made. Beans will keep well in the dried state and are always profitable.

August Ornamental Planting Calendar in Northern California

Written for California Cultivator By A. R. Gould

SCARCITY of water is making itself felt in some parts of our section, and some are letting the lawns dry up. This is more especially the case on some of the large estates where the shortage of labor is also a problem. During the hot dry months of our California summer a considerable amount of water is needed to keep the lawns looking always green and the sprinklers need to be at work daily. Many find themselves compelled to cut down on the water in some parts of the garden, hence they class the lawn as a "non-essential" compared with the vegetable supply, and it is also true that when the lawn is perhaps composed of more weeds than grass it is time to abandon it and not waste water on it. Should the conditions be more favorable for the coming season it would be a good plan to put in a new lawn for the spring, then the fact that the old one had been dried off early would leave things in good shape to prepare the soil for resowing.

It is far better to neglect the lawn than perhaps choice flowers or valuable trees or shrubs. As we repeated before, flowers are "essential," they gladden the hearts of our soldiers and they cheer those who are sad through bereavement, to say nothing of the brightness they bring to the sick and wounded. The hospital wards would be dreary without the flowers. Those who have a surplus of blooms at any time or those who have only a few

choice flowers should not forget the sick and lonely.

Cineraria

Those who made the sowing last month as advised will be able to transplant the seedlings at the end of the month. Prepare seed boxes of fine soil composed of decayed leaf soil for the work of transplanting and keep well watered and in the shade at all times. It will not be too late to sow this month. They are useful for borders in a protected place and make a brilliant show as they have a very wide range of colors or they will also prove valuable for house decoration in pots. C. grandiflora nana, is the house type and C. grandiflora stellata the tall star flowered type.

Sweet Peas, Winter Flowering

The Christmas, or winter flowering type, of which there are now quite a few varieties, may be sown now if choice blooms are desired by Christmas or soon after. A bright color is Early Morning Star, a beautiful deep orange scarlet, and the best white is Early Snowflake. This flower if grown in quantity, providing blooms are choice and put on the market in December or January, should prove a profitable flower for the grower. Deep trenching with manure is necessary to get the best results. Give them full sunshine by placing in an open situation.

Gladiolus

Many of the earlier flowered varieties will now be past their best, and some may be forming seed pods. If you have any choice types you wish to have seed of, shake the flower as the pollen becomes ready, and this will insure pollenization. Some of the later flowering types will be flowering now and should the small white fly be attacking the leaves, as it is in some districts, spray with "Blackleaf 40." This fly or small moth is very destructive and can be observed propagating its kind by laying eggs on the leaves.

Chrysanthemums

These, whether grown for specimen blooms or bush plants, will need every care now, both in staking and feeding with liquid manure or working in a good artificial fertilizer. A few of the later flowering varieties may be pinched back or, in other words, the top of the main shoots may be removed. This will then encourage a more bushy growth. Green and black fly will no doubt be active this month on the plants, but constant spraying with nicotine solution will keep these pests down.

Propagation

Cuttings may be taken towards the latter end of the month of carnations, ivy geraniums and other types of pelargoniums, privet and box. The last named is usually grown for edging garden walks. The cuttings of these subjects should be about two or three inches and inserted in sandy soil on a warm border or placed in a frame. They must be kept shaded from the sun.

TROUBLESOME INSECT

Many complaints are being received at the experiment station concerning a small but troublesome insect which attacks beans, tomatoes, peas, chili, egg plant, petunias, and in fact a wide variety of garden and field plants; and inquiries are made as to the best methods of control. This pest is variously described by inquirers as a "small black bug," or a "black louse," with the statement sometimes that it appears first in the form of a "gnat" with wings and later is followed by wingless "lice."

This pest is in reality a species of plant louse or aphis, a member of a very troublesome family of insects, one or more kinds of which infest practically every kind of food plant or fruit grown by man.

The kind under consideration at present seems to be making its appearance in the majority of cases in the winged form, in great numbers, and these being jet black give it a more gnat-like appearance. If not controlled, numbers of wingless lice soon appear and the plant will be severely injured or destroyed by the loss of sap which these pests suck out through their beaks.

Spraying is necessary for control in most cases. A solution of nicotine sulphate in water is effective. One ounce makes four or five gallons of strong, or eight gallons of weaker spraying solution. This amount to about five or six gallons is good for the present aphis. Dissolve enough of any ordinary soap in water before adding the poison to make a suds if you would have the maximum effectiveness; hard water taking more soap than soft water. Spray thoroughly. These insects are not killed by consuming the poison, but by contact of the solution with their bodies. Hence a fine, driving spray is necessary for good results. Do not neglect the under sides of the leaves. It may be necessary to repeat the spraying several times if the winged forms continue to come in on the crop from outside; but if kept in check until the driving rains of summer come, the difficulty is likely to diminish or disappear.

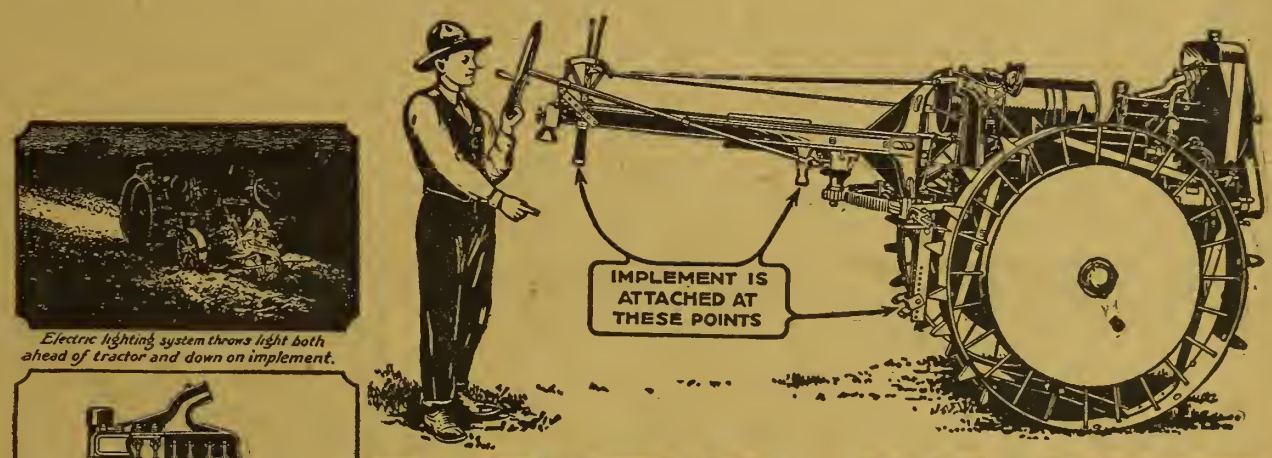
The writer has made use of the weakness of the aphis to withstand driving rain in washing infested plants with strong spray from a hose. This is proving very satisfactory on some tomato plants at present. Of course this means is practicable only in the small garden, and for those who have water under some pressure.

Kerosene emulsion made as follows may be used if preferred: dissolve a half pound of soap in one gallon of hot water; remove from the fire and while still hot add two gallons of kerosene or crude oil. Shake, stir, or, best, pump the mixture into itself until it is a creamy mass. The oil will not separate on cooling if properly made. Dilute with 10 to 15 parts of water for use.

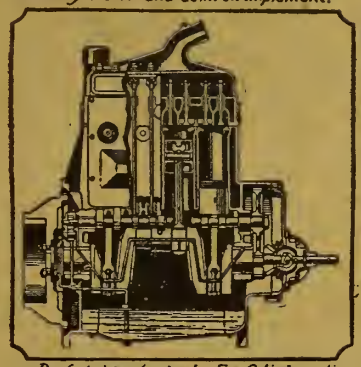
Prevention is better than cure. Begin fighting aphids as soon as they appear. Do not destroy your friends, the lady bird beetles or "lady bugs." They live upon aphids. Do not slay your friends the birds. They destroy more insects than you can even imagine.—Charles T. Vorhies, University of Arizona.

Someone has described the man who evaded the draft as being like a lemon pie. Yellow clear through and without enough crust to go over the top.

No Other Tractor Has So Many Good Mechanical Features=



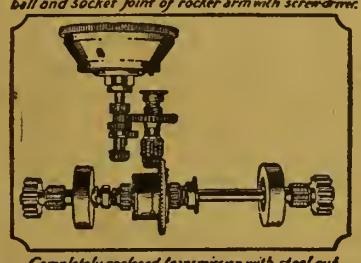
Electric lighting system throws light both ahead of tractor and down on implement.



Perfected overhead-valve Four Cylinder engine, with force-feed oiling system under 55 lbs. pressure.

Diameter of connecting rod bearings 2¾ in. compared to piston diameter of 3¼ in. insuring long life.

Valves placed in perfect adjustment by turning down ball and socket joint of rocker arm with screwdriver.



Completely enclosed transmission with steel cut gears, Hyatt bearings, differential lock, and brakes

MOLINE UNIVERSAL TRACTOR

It Solves The Farm Help Problem

EVERYONE who knows what a tractor should do, agrees that the Moline-Universal has three distinct advantages over all other tractors: lighter weight; greater economy and ease of operation; ability to do all farm work, including cultivating; and ONE-MAN control of both tractor and implement from the seat of the implement, where you have always sat, and where you must sit in order to do good work.

Aside from these distinct advantages which the two-wheel construction gives, the Moline-Universal Tractor, Model D, is still the best tractor on the market. In every detail it has been refined and perfected to the utmost limit of modern engineering knowledge.

Self Starter—Electric Lights

The Moline-Universal is the only tractor regularly equipped with a complete electrical starting, lighting, governing and ignition system. The starter saves many hours of productive work, besides eliminating back-breaking labor. Electric lights enable the tractor to be worked at night during rush seasons.

An electrical governor perfectly controls the engine speed. By simply turning a dial, within easy reach of the operator, engine manitains any speed from ½ to 3½ m. p. h., and automatically handles all changes in load.

Perfected Four-Cylinder Engine

The perfected four-cylinder engine is the latest development in overhead-valve construction. With a bore of only 3½ inches a 2½-inch crankshaft is used. The strength and thickness of the crankshaft eliminates all vibration. Oil is forced through hollow crankshaft to all the main and connecting rod bearings under a pressure of 35 pounds to the square inch. The bearings float on a film of oil, so their surfaces never touch.

Double valve springs give unusually quick action with soft seating. Rocket arms are swiveled on ball and socket joints that may be turned down with a screw driver, placing the valve mechanism in perfect adjustment at all times. This engine develops unusual power and is very economical in operation.

Steel Cut and Hardened Gears

The transmission is completely enclosed, with drop forged, hardened, and cut steel gears running in oil that reduce power loss to a minimum. All gears are mounted on heavy duty Hyatt roller bearings, with high grade ball bearings fitted with adjustable collars to take up end thrust. Fifteen Hyatt roller and five ball bearings are used in the Moline tractor. Seven splined shafts are used in locking gears to shafts. This is the strongest construction known, and has the additional advantage that it makes the transmission easy to take apart.

For pulling in soft ground, the two drive wheels can be made to revolve as one by means of a differential lock, doubling their pulling power.

Complete Enclosure of All Parts

The final drive is completely enclosed in dust tight shields, the edges of which are sealed by heavy grease used to lubricate the gears. Every part of the Moline-Universal tractor is protected against friction and wear.

All working parts are accessible. All the weight is so well balanced on two wheels that the rear end of the tractor can be supported with one hand.

The Moline-Universal Model D will give you longer and better service at less expense than any other tractor. It is built for positive reliability.

Our catalog describes the Moline-Universal in detail. Send for it. Address Department 49.

MOLINE PLOW COMPANY, Moline, Ill.

PURE BRED REGIST'D HOLSTEINS

Tuberculin Tested State Supervision

Production Butter Fat Everything Guaranteed

King Korndyke Pontiac

(shown above)

is getting just the sort of calves that we want in our herds, beautiful individuals, nicely marked, and a very large percentage of them are heifers.

Most everyone knows that he is a son of the great and only King of the Pontiacs, but have you stopped to consider what his sisters are doing right here in California? One of them, K. P. Tola Joe, holds the state record for a senior two year old with 27.18 pounds butter in seven days; another, K. P. Idyl Segis, has just broken the state junior four year old record with a production of 35.78 pounds butter in seven days; another, K. P. Tola, made over 34 pounds butter in seven days as a senior four year old; and K. P. Tola Joe came back as a senior three with over 32 pounds butter in seven days.

Why not put a choice young son of King Korndyke Pontiac at the head of your herd? One of his sons sold for $6500.00 at public auction showing the value that the best breeders place on this blood.

We are pricing his young sons at figures that dairymen can well afford to pay, and you will be pleased with the liberal terms we make. Visit the farm or write us now.

Below is our other great herd sire

Prince Gelsche Walker Korndyke

JANE GARDEN FARM

SACRAMENTO — CALIF.

FRED W. KIESEL PROP'R. C. W. YOUNG SUP'T.

Individuality Breeding

Put the Best Blood in Your Herd

The cow making the highest official yearly butter record for 1917-1918, as shown by the report just issued by the Holstein-Friesian Association of America (and it is the world's official record for one year) is Aaggie Acme of Riverside 2nd. She is out of the same dam as our senior herd sire

Prince Riverside Walker

The junior three year old heifer making the highest yearly butter record for 1917-1918 as shown by the report just issued by the Holstein-Friesian Association of America, is Miss Valley Mead De Kol Walker. She is by the same sire as our senior herd sire, PRINCE RIVERSIDE WALKER.

Buy your herd sire in the blood lines that are doing things TODAY and that will increase in value in the records they are bound to make in the TOMORROW.

We have just a few good bull calves by PRINCE RIVERSIDE WALKER, out of splendid dams. They move young at our prices.

Our Entire Herd is Tuberculin Tested

Grain Sorghum Popular Crop

Written for California Cultivator By W. S. Guilford

SOME of the best registered hogs in the Sacramento Valley are being grown on a ration that consists very largely of milo maize and alfalfa. In a number of instances these crops are by-products in orchards.

Some of the corn is grown as a second crop on land that is just planted to corn in June. While dwarf milo is most generally grown now, some favor brown Egyptian corn. According to Farmers Bulletin 972, the sorghum corns are being more largely used for human foods and in making industrial alcohol.

It is a common thing to hear California farmers who have come here from the corn belt say; "Oh this sorghum corn is all right, but it doesn't begin to have the food value of good old Indian corn." Yet from the analysis of over 300 samples of different kinds of grain sorghums it compares favorably with Indian corn. The analysis follows: Sorghum; water 9.41, ash 1.69, protein 13.13, carbohydrate 70.91, fat 3.30, fiber 1.53. Indian corn; water 10.60, ash 1.50, protein 10.30, carbohydrates 70.40, fat 5.00, fiber 2.20. It will be noted that only in fat are the sorghums lower than the Indian corn, and they contain less crude fiber.

The difference between the sorghums and Indian corn is principally in their digestibility. The results of a number of experiments seem to indicate that the sorghums are about ten per cent less digestible than Indian corn, making their feed value about 90 per cent of the latter grain.

In storing sorghum grain in the head it is advisable to have ventilators in the center of the bins or cribs. At Monroeville Orchard we store it in slatted cribs made similar to Eastern corn cribs.

A good deal of the crop in the Sacramento Valley is harvested rather late in the season and is apt to be damp from rains. In the late crops there are also many partly matured heads. There is a great temptation to pick these on the theory that they will dry out and make some feed. When the crop is gathered in this condition it should be spread out thinly on a floor so that it can dry. Otherwise it will heat and mould, as it will when threshed and sacked.

There is a prejudice against feeding sorghum corn to horses and mules, especially among old time "mule skinners" who are used to feeding barley. They say it "heats 'em up too much." This might be true if fed heavily for a long period, but Senator Frank Leavitt fed corn to his horses at Packer Bend Farm in Glenn County this season with very good results.

Black and Whites in Almost Every California Pasture

California Holsteins have made a name for this state. World's records have been made and an answer to the demand for food has been made with a milk production which has been wonderful.

Field Notes from the Live Stock Men

Don't breed pedigrees—breed hogs.

Chicago reports cattle markets as seriously affected by restrictions in beef consumption.

Mendocino County wool growers have been disposing of their wool clip at around 64 cents for better grade.

Beef cattle breeders are considering more and more the worth of the silo in beef production. At present day prices the silo is a winner.

The Lake Mills Holstein Breeders' Consignment Sales Company announces the next semi-annual sale to be held at Lake Mills, Wisconsin, October 22-23.

Western wethers in Chicago markets, which are not especially choice, are selling around $13.50, and lambs are in keen demand at $16. The supply is under the expectation.

Aberdeen-Angus will be judged at the coming Chicago International by George Cram of Aberdeenshire. He is recognized as one of the most capable judges of Aberdeen-Angus in Britain.

Milking Shorthorns are increasing in popularity in England, and one bull, Thornby Premier, recently sold at the Arnold S. Wills sale at $1000. Forty-two females averaged $1015 at the same sale.

AYRSHIRE BREEDERS' SECRETARY

At a meeting of the board of directors of the Ayrshire Breeders' Association, held in New York, July 8, James G. Watson, in charge of the extension activities of the association, was elected secretary and treasurer as successor to the late C. M. Winslow. Mr. Watson is a Scotsman by birth. He is a graduate of the Iowa state college of agriculture and was extension dairyman at that institution for two years. He filled a similar position with the University of Missouri. He was manager of the Southwestern Dairy Show at Kansas City, 1916.

FOR MILKING MACHINES

Clear and Clean as Water

B-K keeps tubes and cups sweet and clean. Penetrates milk solids—kills the bacteria. Is clean—harmless—cannot taint milk. B-K makes rubber parts last longer—cannot harm metal. Used and recommended by Milking Machine Manufacturers for years. Cheapest in actual use—sold under guarantee. Get B-K today—end sour milk troubles. Send us your order and your dealer's name. Send for dairy bulletins and "trial offer."

General Laboratories—Madison, Wis.

3143 So. Dickinson St.

Dutchland Sir Pietertje Creamelle

Is a name that is becoming firmly entrenched in the story of high producing Holsteins in California.

By a grandson of the great transmitting cow Changeling, and out of a daughter of the former world's record cow Creamelie Vale, he is bred to great production and has already proven his worth with 18 A. R. O. daughters in our herd, records up to over 30 pounds butter in seven days.

We enjoy a steady sale of good bulls to dairymen, many of them coming back for their second and third bull. We believe we can fill your requirements in the bull line. Write us or visit our farm.

REPORTS ON JUNE LIVE STOCK MOVEMENT

Increases in the receipts of all classes of live stock, except horses and mules, at stockyards in 58 cities during June, 1918, as compared with June, 1917, are shown by the monthly report on live stock at stockyards, issued by the bureau of markets, United States department of agriculture. The increase in cattle receipts amounted to 29,602, or 1.7 per cent; the increase in hog receipts amounted to 153,905, or 5.5 per cent; and the increase in sheep receipts amounted to 173,470, or 14.3 per cent. Increases in cattle receipts in 56 cities for the half year ending June 30, 1918, as compared with the corresponding period for 1917, totaled 981,366, or 10.4 per cent. The corresponding figures for hogs show an increase of 1,748,043, or 8.1 per cent. A comparison of the sheep receipts for this six month period with those for the first six months in 1917 shows a decrease of 192,155, or 2.6 per cent.

GUERNSEYS AT FAIR

A special premium offer will be made by the American Gurensey Cattle Club for award at the California State's Fair's live stock show, August 31 to September 8. The club offers cash premiums totaling $100 to Guernsey breeders showing at the State Fair. The money will be apportioned among the older herds, get of sire and produce of dam classes, two year old and yearling heifers and advance registry cows.

PRODUCES MILK WITH LOW COUNT IN ORDINARY BARN

Milk with a low bacterial count can be produced in practically any cow barn. Any dairy farmer with a healthy herd can produce such milk with an investment of only $10 or $20 and a little extra care.

The United States department of agriculture in an experiment produced low bacterial count milk in a poor dairy barn.

The only changes made were:

Simple steam sterilizer for utensils.

Clean cows, especially clean udders.

Small-top milking pails.

Proper manure removal and good bedding.

The bacterial count fell from as high as 1,200,000 to an average of 2154.

Any farmer can produce clean milk.

Low bacterial count is the beginning of good milk, but milk must also be safeguarded from other contamination likely in a dirty barn. There is no legitimate excuse for the production of milk from dirty cattle or in a filthy stable. In addition milk must be properly cooled to prevent the multiplication of bacteria.

FARM PONIES

By W. S. Guilford

Some folks think that Shetland ponies and pony outfits are only for rich people and for use in the parks in cities. The fact of the matter is that there is no place where a pony is of more real value than on the farm. There was never a time when boys and girls could be of more use on the farm than now—in fact they can be a factor of considerable importance in the harvesting of the crops this year if they are managed rightly.

And with a pony a good boy or girl can be of as much or more service in running errands on the farm and to town as a grown person. They can get repairs and do hauling of light articles and all such things as well as anyone. This makes many self reliant boys and girls; the ownership and care of the pony makes character and instills a love for live stock as nothing else will.

You Can't Afford This

No farmer is rich enough to feed 40-cent butter to his hogs or his calves in partially skimmed milk.

It's a waste of money.

It's a waste of food.

It's a waste that your pocketbook, your neighbors, your country, all condemn.

But it's a waste that is going on today on every cow-owner's place where an inferior or half-worn-out cream separator is being used, or where the farmer is skimming by the wasteful "gravity" method.

And it's a wholly unnecessary waste, too.

Because a De Laval Cream Separator will soon save enough cream to pay for itself, and put a stop to all the waste of cream and time and labor for many years to come.

There is no other cream separator that can compare with the De Laval in clean skimming, capacity, ease of operation, freedom from repairs, and durability. It's the world's greatest cream saver.

Order your De Laval now when you need it most and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

Live Stock at Hawaii's First Territorial Fair

Written for California Cultivator By Ralph J. Borden

PACIFIC Coast breeders of live stock will be interested in knowing something about the live stock shown at Hawaii's First Territorial Fair in Honolulu, June 10-15, 1918.

Most of the prize winners at this fair can be traced to or came directly from mainland, chiefly Pacific Coast, breeders. A fine array of beautiful animals came before Prof. G. H. True of California who judged the live stock, and he as well as other visitors and our own people, was agreeably surprised at the quantity and excellence of the individuals shown.

Holsteins, Herefords, and Berkshires predominated, but there were some fine examples of Jerseys, Guernseys, Ayrshires, Aberdeen-Angus, and Durocs, Hampshires and Tamworths. There was also a fine showing of thorough bred and Percheron horses and a large class of polo ponies which was easily topped by that world famous animal, Helen C.

In the Holstein classes the competition was heaviest in the aged bull and aged cow classes. In the former class, there was much surprise, when the bull, Lord Asa, which had recently been imported from Napa State Hospital by C. W. Lucas of Honolulu and which had won renown at the California Land Show last year, was beaten by a younger animal owned by the Kamehameha Schools of Honolulu. This bull, King Korndyke Pontiac Terpstra 174898, has developed into a beautiful example of Holstein type and was in perfect show ring condition. Beside winning himself, he headed the "Exhibitor's Herd" that won first place and it was his "Get of Sire" that also took the blue. He was bought in the 1915 Sacramento sale, having been consigned by A. W. Morris & Sons of Woodland. His sire is King Korndyke Pontiac who now heads F. W. Kiesel's herd at Sacramento.

In the aged cow class, Blissen, a beautiful animal owned by C. W. Lucas, which was purchased from Napa State Hospital, was awarded the blue. She was closely pressed by a cow shown by the College of Hawaii and won out with her beter condition.

Other winners of special note, which had been imported from Coast breeders were: A two year old Holstein bull, Carnation McKinley Pietertje owned by Robert Hind of Hawaii and which originally came from the Carnation Stock Farms, Seattle; a Holstein cow under three years, Hartog Pontiac De Kol Burke, a daughter of Segis Pontiac De Kol Burke, which was bred by A. W. Morris & Sons, Woodland and now owned by the Kamehameha Schools at Honolulu; a Holstein two year old heifer, Mollie Dutchland Colantha, a daughter of Dutchland Sir Korndyke Colantha from James McGillivrays herd at Sacramento and also owned by the Kamehameha Schools; an aged Ayrshire bull owned by Lihue Ranch of Kauai and which came here from J. W. Clise's well known Washington Ayrshire herd; an aged Ayrshire cow, Willowmoore Buntie B, owned by G. P. Cooke of Molokai which also came from J. W. Clise, Washington; an Aberdeen-Angus bull owned by Grove Ranch of Maui; a two year old Hereford bull, University Prince, which H. W. Rice of Maui recently purchased from the University Farm at Davis, California; an aged Berkshire boar, Anoakia Duke 3d, owned by the Kamehameha Schools farm which was imported from Santa Anita Ranch in California; aged Berkshire sows owned by H. W. Rice of Maui which were imported from well known Pacific coast hog breeders; and many others.

The livestock show was certainly "a winner for a beginner." Already the breeders are making their plans for next year, and the Pacific Coast breeders will undoubtedly find in Hawaii an outlet for some of their best stock during the coming year.

To be an Hawaiian Herd-header

King Korndyke Pontiac Terpstra, 174898. First prize aged Holstein bull at Hawaii's First Annual Territorial Fair, Honolulu, Hawaii, June 10-15, 1918. Owned and exhibited by Kamehameha Schools Farm, Honolulu. "One of California's sons who has made good in Hawaii."

PRUSSIC ACID IN SORGHUM

It is well known that sorghum cane, in its younger stages, at least, contains an appreciable amount of that deadly poisonous substance, prussic acid. Stock raisers aften ask how poisonous sorghum is, and when it becomes harmless. Many analyses of cane show that after the plants are four feet high there is no danger in feeding reasonable amounts of it. If the animals break into a field and gorge themselves, they will no doubt get the "colly-wobbles" just as they would in a field of green corn. It would require about 125 pounds of sorghum to furnish a fatal amount of the poison. The latter is always higher in amount during excessively dry periods, and in sickly, stunted, yellow cane. Sorghum seeds do not contain any prussic acid until several days after they have sprouted.—J. J. Willaman, University of Minnesota.

Stick to Your Type

By W. C. Rosenberger in Shorthorn in America

AN army of soldiers firing at random accomplishes no less than an army of breeders who have no particular aim in their breeding operations beyond the natural increase in numbers. So often has this theme been harped upon that it seems now to be a senseless waste of time for the "harper" to take it up again. However, it is such a woeful waste of time and energy for the beginner to depend solely upon the school of experience wherein he is his own preceptor. "Experience is a dear teacher, but fools will learn at no other." Much truth in that, but then the great big majority of Shorthorn breeders are not fools, and if the importance of working toward a distinctive type in their breeding operations were impressed upon them most of them will profit by the experience of others and save themselves much time, expense and disappointment.

The first essential for a beginner is to find out what is the proper type. That knowledge can best be acquired by visiting the best cattle shows and sales and seeing what kind of cattle find most favor in the eyes of competent judges, and the kind that bring the most dollars from successful breeders. Having firmly fixed in mind the type you wish to breed, select foundation stock as near your ideal as you can find. Stick to your type. It is the easiest thing in the world to be led astray by running onto a "bargain" in a breeding matron though she doesn't measure up to your standard. Leave her alone. That's very likely the reason she is a "bargain."

Having determined upon your type and with prospective purchases in mind, it is advisable to look into the ancestry. All traits and characteristics are more or less hereditary and while imperfections may be absent in the first generation it is not at all unlikely that they will crop out in the second or third. Next to the importance of individual merit in your foundation stock it is essential that they come from a typical ancestry.

Some years ago a Shorthorn man who had gained considerable prominence as a breeder found it necessary to change herd bulls. He selected a splendid individual, a beautiful roan, hard to find fault with in any particular. His first crop of calves, however, was disappointing. A large proportion of them had black noses and their coats were full of black hair. While these imperfections may seem trivial from the beef makers' standpoint, it can not be denied that it made them undesirable members of a breeding herd. Unfortunately this breeder investigated his herd bull's antecedents after rather than before his purchase and found that the owner of his grandsire had beefed him as well as his black nose progeny for that fault. Such things as black hairs, black noses and unsightly horns may appear trivial to some because they have nothing to do with conformation, but an animal with those imperfections is unsightly and undesirable as a reproducer because it is unsightly.

It is scarcely within my province, or that of any other breeder, to choose for you a type. My ideas might be at variance with yours and since your judgment may be the better, it would be wrong for any breeder to warp it with the insistence that his ideals are the only correct ones. However, the beginner can not go far wrong by acting upon the advice of a successful breeder to solve the perplexing questions that continualy confront him.

Whatever measure of success I have attained as a breeder and exhibitor, I believe to be due to the fact that I have always endeavored to breed to a type, and though I may have won my share of prizes I am by no means satisfied, not because I have not won more but because I have not yet produced my ideal Shorthorn and possibly never will. But, I shall keep on trying.

If I were asked to give the specification of my ideal Shorthorn it would be a task beyond me. I could enumerate the most essential points, but there is something else, which, while it has nothing to do with type, if by type you mean general conformation, is something very much to be desired in a breeding animal. Anyway if that something is lacking, the animal doesn't suit you. What is it? Perhaps we may call it character, which taken literally, means a total of good qualities but with the breeding fraternity has a much broader meaning. If there is anything about a cow we don't like but can't describe we say she lacks character, and assume the other fellow knows what we mean. So, we'll call it character and insist that our breeding animals possess it along with type.

What we are striving for in the beef type, of course, is an animal upon whose frame we can grow the greatest amount of beef in the shortest possible time, and don't forget that time is not the least in importance.

Having selected foundation stock that approximates your type ideal, and assuming that you have chosen wisely, as surely as "like begets like" the progeny will be of the same caliber. But your work has just begun. So far you have only exercised judgment in calf production, henceforth it means physical exercise as well as to give them the care and attention necessary to properly rear them. Neglect during calfhood has ruined many a show prospect. Care and feed are as essential to the proper development of a breeding animal as to one destined for the show ring.

Nearly every beginner resolves that he will give his herd just a little better care than other breeders, but as the herd increases resolutions are broken. As a matter of fact care should increase in greater ratio than the calf herd because you have more at stake. I will conclude with this suggestion: Choose the right type, resolve to take good care of your herd, then see that you stick to both type and resolutions.

ARMY MAKES A RECORD MEAT PURCHASE

The largest single order for bacon and canned meats in the history of the world—99,560,000 pounds of bacon and 134,000,000 pounds of canned meat—has just been placed by the quartermaster's department, U. S. A., for the American army overseas. This will take the bacon from approximately 1,900,000 hogs.

My Stock Tonic is never peddled.

25-lb. Pail, $2.25; 100-lb. Drum, $7.00.

Why Pay the Peddler Twice My Price?

Dr. HESS Stock Tonic is a Conditioner and Worm Expeller

Keep Your Animals in Condition

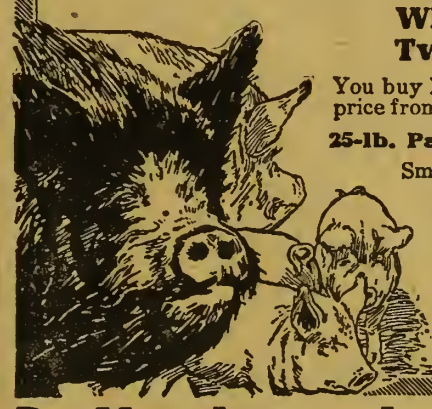
Now is when your stock need special attention because the change from pasture to dry feed is one of the most critical periods of the whole year.

You can lose more pounds of summer gain through November neglect than you can get back all winter. Keep up the good condition—keep up the summer thrift—keep out the worms.

Dr. Hess Stock Tonic

Drives Out the Worms. Makes Stock Healthy

Keep the animals' systems right and you need have little fear of disease. Stock Tonic tones the stomach and the digestive organs, gives better action to the bowels, improves the blood, purges of worms, and gives real life and vigor. The *Nux Vomica* in it aids digestion. *Quassia* is a true tonic and a worm expeller. The *Sulphate of Iron* is a blood builder and worm expeller. There is *Epsom Salts* for a laxative, and *Nitrate of Potash* to act on the kidneys.



Why Pay the Peddler Twice My Price?

You buy Dr. Hess Stock Tonic at an honest price from a responsible dealer in your town.

A CYCLONE SILO Will Save You Big Money On Your Feed Bill

If you are in the farming business to make money you must save as well as earn—a silo will save you its cost in the first year of its use. With a silo you can convert into first-class stock feed a lot of your product that you have wasted in the past—

The CYCLONE SILO

—is constructed to stand up under the most trying conditions. Flat iron bands encircle the CYCLONE (as illustrated) in such a way that it cannot possibly twist or warp out of shape—does not get smaller at top than bottom after usage. No guy wires to stumble over.

We, who make this silo, have been manufacturing wood tanks, wood stave pipe, etc., for use in all parts of the world for 25 years—we know our business and our guarantee that this silo is right means something.

Fighting Grasshoppers

Written for California Cultivator by E. R. de Ong

THE many outbreaks of grasshoppers occurring throughout the state makes it imperative that extraordinary care be given to their control. This applies especially to the northeastern counties of the state, the northern end of the Sacramento Valley and the west side of the San Joaquin Valley. In some instances large areas are infested but in most cases the outbreaks are local and the damage caused is acute, especially in young orchards or vineyards. These swarms usually originate in uncultivated ground, especially dry, rocky hill land. In the valleys egg laying is most common along roadsides, ditch banks and in alfalfa land. As the food is exhausted near the breeding grounds short flights are made into adjoining fields and orchards, where the insects remain until the egg laying season in late summer. At this time of the year the males may be found in abundance in localities favorable for the depositing of eggs, the females being present only long enough to lay a cluster of eggs and then return to the feeding ground. The eggs are placed in little holes bored in the ground or in clusters of grass and remain unhatched until the following spring. Occasionally there is a scattering second brood but usually it is of little consequence. These breeding grounds should be located as closely as possible in the fall so that control work can be concentrated on these points early in the spring. Some results can be gotten by cultivation of these breeding grounds in the fall or winter or by plowing them to a depth of about eight inches. But the greatest advantage comes in early applications of poisoned bait to these areas before the hoppers scatter or attain any size.

One of the most successful means of fighting grasshoppers is by means of a poisoned bait the common formula for which is as follows: 25 pounds wheat bran, one pound white arsenic or Paris green, two quarts blackstrap molasses, one-half dozen lemons or oranges, four gallons water.

This material is mixed carefully and broadcasted at the rate of five pounds per acre in alfalfa or other field crops. For orchard work it is sprinkled about under the trees and especially on the side from which the insects are coming. Damp ground is usually attractive to grasshoppers and can properly receive extra attention.

To secure the best distribution in the field, the common type of broadcast grain seeders are used. This will cover a strip about 30 feet wide, scattering the bait so thoroughly that it will be eaten up rapidly by the grasshoppers. Coarse lumps of bait will dry before being eaten and should be picked up.

Another type of distributor, originating in Kansas, is a canvas bag carried over the shoulder to which is attached a feeding device. From the lower corner of this bag is drawn off a sleeve 12 inches long, 13 inches in circumference at the upper end and eight inches at the lower end. A metal tube, 28 inches long, two and one-half inches in diameter at the upper end and at the lower end one and five-eighths inches, is fitted into this sleeve. Over the lower end of the tube wires are soldered to break up the bait in passing through. This tube is swung back and forth in front of the operator, distributing the bait evenly and quickly over a strip of ground 50 or 60 feet wide.

If bran is difficult to secure fine sawdust has been used up to one-third or one-half the amount of wheat bran, without apparently making any difference in the results obtained.

Either white arsenic or Paris green may be used as the active ingredient. The latter is more expensive but mixes readily with the dry bran and may be secured at almost any trading point. White arsenic has a tendency to pack thus making it more difficult to mix with the bran. This may be overcome by combining it with equal parts of a good grade of caustic soda or concentrated lye, the two chemicals form a solution without boiling. Sal soda may be used in place of caustic soda at the rate of one ounce of arsenic to two ounces of soda, by boiling these a short time a solution of sodium arsenite is formed which is combined with the molasses and fruit and mixed thoroughly through the bran.

The molasses used should be one having a strong flavor otherwise it will add little to the efficiency of the mixture. The fruit is put through a meat chopper, both the pulp and juice being used. Over-ripe cantaloupes or tomatoes are sometimes substituted for the citrus fruits. Mix the ingredients in a tub, barrel or mortar box, adding sufficient water so that the mixture crumbles well in broadcasting. The more water it contains the better as it loses its attractiveness after drying.

FEDERAL GOVERNMENT TO PROTECT LUMBER OWNERS FROM FIRE

In accordance with the state wide movement to save food, forage and forests from fire, as a war emergency measure, the forest service for California has completed cooperative arrangements with 126 individual owners of more than 250,000 acres of timber lands by which all fires are discovered, reported and put out by the government. The forest service, after accepting deposits, averaging 1½c per acre, from the owners, guarantees to protect the timber and fight all fires at government expense.

BELTING

The intelligent farmer of these days understands many mechanical principles; he comprehends what the scientist has proved in the relation of luguminous plants to nitrogen in the soil; what is meant by r. p. m. and by differentials, magnetos; distillate and grease; but it seems he has no conception of the difference between TEST SPECIAL belting and all the other kinds offered to farmers, with no manufacturers' guarantee to back them.

TEST SPECIAL BELTING is made to wear---to give long and satisfactory service---to give years and years of work the cheap belting doesn't do and can't do. It is foolish to buy poor belting, just as it is bad judgment to invest money in wildcat schemes---or cheap machinery that won't stand up to the work.

Write us in detail about your needs---let our engineers suggest what to use and how to apply it.

Protect belting from weather to insure longer life.

The Star Spangled Banner

By Francis Scott Key

Oh, say, can you see, by the dawn's early light,
What so proudly we hail'd at the twilight's last gleaming,
Whose broad stripes and bright stars thro' the perilous fight;
O'er the ramparts we watched were so gallantly streaming?
And the rockets' red glare, the bombs bursting in air,
Gave proof thru the night that our flag was still there.
Oh, say does that star spangled banner yet wave
O'er the land of the free and the home of the brave.

On the shore, dimly seen thro' the mists of the deep,
Where the foe's haughty host in dread silence reposes,
What is that which the breeze o'er the towering steep,
As it fitfully blows, half conceals, half discloses?
Now it catches the gleam of the morning's first beam,
In full glory reflected, now shines on the stream.
'Tis the star-spangled banner; oh, long may it wave
O'er the land of the free and the home of the brave.

Oh, thus be it ever when freemen shall stand
Between their lov'd homes and the war's desolation;
Blest with vict'ry and peace, may the heav'n rescued land
Praise the pow'r that hath made and preserved us a nation.
Then conquer we must, when our cause it is just,
And this be our motto: "In God is our trust!"
And the star-spangled banner in triumph doth wave
O'er the land of the free and the home of the brave.

THE THIRD VERSE

THE Stars and Stripes, the "Star Spangled Banner" of which Francis Scott Key sang when he created our national anthem, has gone across the sea to help Britain drive the Hun out of France and Belgium. The task is too great for France and Belgium unaided.

There are still a few who think Europe a strange place in which to see our fighting forces battling and our flag floating over those forces. France and Belgium, they may think, have nothing to do with the Star Spangled Banner, and they would wish our national anthem rewritten, if we must fight "over there."

There is no need to rewrite the "Star Spangled Banner." France and Belgium may sing it just as it stands and as whole heartedly as they sing their own national songs. If Francis Scott Key had been a seer he could not have written a song to express more truly the duty America is now performing. France is threatened with annihilation, Belgium hardly lives. The free men of France and Belgium, true heroes! are standing between their homes and the desolation the Hun is bent on spreading. If, by America's unselfish power, France is saved, and Belgium is saved, they may well praise that power for saving them. "The Star Spangled Banner" is a world song today, and the flag it sings is to be the savior of the world. How goes the song?

"O, thus be it ever, when freemen shall stand
Between their loved homes and the war's desolation."

So be it! May our flag be there, taking the part of the freemen, when Hun or vandal, Goth or savage, threatens peaceful homes with the desolation of war.

"Blest with victory and peace, may the heaven rescued land
Praise the power that hath made and preserved her a nation."

So be that, also! May Belgium, may France, restored and whole, praise the power that made them free nations in the beginning and preserved them free nations through the intervention of our flag. The power that made us a power has led us into battle and guided us aright. That power has given us the strength that will preserve France and give renewed life to Belgium.

"Then conquer we must, when our cause it is just,
And this be our motto: 'In God is our trust!'"

For did ever a nation have a juster cause? Was there ever a cause better worth fighting for? Or more worthy of triumph? For that must be the conclusion of the war—

"And the star spangled banner in triumph shall wave
O'er the land of the free and the home of the brave."

Not forever, as over conquered lands, but for a brief moment while the Hun creeps back to his cave, let the star spangled banner wave in triumph over France re-won, a land of the free, and over Belgium re-conquered, a land of the brave. Released from the murdering, destroying Prussian, the marauded nations, France and Belgium, will again stand whole and well. America will have done her part. And then? Why, then let it be always the same. Let us preserve our strength, ready to aid the democracies against the encroachments of autocrats and to prevent new horrors such as the world is seeing! And, wherever those freemen may be, and whenever the call—

"—thus be it ever, when freemen shall stand
Between their loved homes and the war's desolation!"— Riverside Press.

FORTUNATE THE AMERICANS!

Fortunate the Americans in this land of plenty who can find day after day some hardship to endure! Happy the "wheatless-till-harvest" citizens.

Let those who have murmured over mixed breads read this bill of fare:

Breakfast—Acorn coffee, two slices of bread made of rye, sawdust and potato flour.

Dinner—Soup with a small piece of tough beef, coarse turnips and no potatoes.

—Supper—Soup again with two slices of bread.

This represents the fare of 15 American prisoners in Germany, according to a Canadian soldier recently escaped from a German prison. These men were captured in a trench raid last October and since then had been marched many miles on these rations.

Our men, said the Canadian who had talked with them, had not received parcels of food like other soldiers. As a result of their treatment they were thin, weak and mentally dazed. In this condition they had been exhibited from village to village as a proof that the American army could not stand against German trained soldiers.

In the lines and behind the lines America is giving daily proof that she can stand against any amount of German training. There is no better evidence of this fighting spirit than the continued response of the food administration's wheat saving campaign. Entire counties have given up their holdings of flour, and two states, Idaho and Texas, pledged their willingness to give up wheat if necessary. Total abstainers clubs have been formed in different states.

If days and weeks and even months to come are wheatless, let no whiner call himself an American. In this world of heroic suffering, fortunate the American who can find some hardship to endure!

The Cultivator Patterns

8923—Girl's One Piece Dress. Cut in sizes 6, 8, 10 and 12 years. The dress is to be slipped on over the head.

8914—Ladies' Corset Cover. Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. The pointed pieces at the back are crossed and buttoned at the waistline.

8899—Ladies' Waist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The reveres are attached to the small roll collar.

8901—Ladies' Apron and Cap. Cut in sizes 36, 40 and 44 inches bust measure. Two large pockets are stitched at the sides of the apron.

8894—Ladies' Dress. Cut in sizes 36, 38, 40 42 and 44 inches bust measure. The shirtwaist buttons at center front; the skirt has three gores.

8604—Girls' One Piece Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The dress is a coat model and it is belted in at the normal waistline.

8922—Ladies' Three Gored Gathered Skirt. Cut in sizes 24, 26, 28, 30, 32 and 34 inches waist measure. The skirt is gathered at the sides and back to the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all paterns. Address

HOUSEHOLD QUERIES

Dill Pickles

I am wanting a recipe for making dill pickles and am unable to find one anywhere, so am writing to ask you if you could tell me how they are made: the proportion of salt and dill.—Subscriber, Lemoore.

Use knife to cut cucumbers from the vine so as to leave a short stem. Do not rub off the little briers. Cucumbers three to four inches long are a good size for dill pickles. Put layer of grape leaves on bottom of stone jar, then a layer of dill, then a layer of cucumbers, repeating grape leaves, dill, cucumbers till jar is full. Cover top with grape leaves. Make brine of six quarts water to three-fourths pound salt (enough for 100 ordinary sized cucumbers). Boil. After cooling pour over cucumbers, with the addition of seven cups vinegar if wished. Place cloth over pickles, over this a board or plate that will fit down on the pickles. Weight this down so that all cucumbers are forced beneath the brine. Leave in dry cool place ten days, then pour off brine, wash pickles carefully and cover again with cold, freshly boiled brine (or brine and vinegar) as before. The pickles are ready for use in about 30 days. About two pounds of dill is required for four gallons of pickles.

Cucumbers in Brine

Please give recipe for common brine pickling of cucumbers. — Subscriber, Wasco.

To one gallon cucumbers add one cup salt and cover with boiling water. Let stand 24 hours, pour off brine, boil and pour back over pickles. Let stand 24 hours and repeat; repeat third time. These will keep perfectly in barrel or stone jar if weighted board forces all cucumbers under the brine. If desired they may be put in jars and scalded without further treatment. Of course if weaker brine is used it might be necessary to sterilize after putting in jars. When wanted for pickles these cucumbers may be taken from brine, washed and covered with boiling water and vinegar, equal parts with alum size of hickory nut. In about six hours the pickles will be firm and ready for use.

Sweet Cucumber Pickles

How do you make sweet cucumber pickles?—Subscriber, Wasco.

Soak cucumbers in brine two weeks; drain and if large slice lengthwise. Boil 20 minutes in syrup of six pounds sugar (or substitute), four quarts vinegar. Keep in tightly covered crock.

Food

PICNIC MEATS

As a temporary measure we have been asked to eat less beef, but are assured that we may at present eat more pork and have never been told to go lightly on liver and tongue, so let's adjust home appetites to meet the shipping program. Summer days call for cold meats for supper and for picnics. Don't depend on tin cans for these meats. You can prepare delightful dishes without drawing on the national reserve of canned meats. It is a good plan, too, to pile up your own reserve of home canned meats.

Pickled Tongue

Boil a fresh tongue by placing it in hot water, let come to boil and boil gently for three hours or until tender. When cooked, remove from water, skin, put back into water and let get cold. Slice in thin slices, put one layer of sliced tongue in bottom of an earthenware crock, then one layer of sliced onions, a few thin slices of lemon, salt, pepper, a little sugar and mixed spices. Repeat until all material is used up, having the onion and lemon on top. Cover all with vinegar. If vinegar is too strong, use two-thirds vinegar and one part water.

Pressed Beef Tongue

One beef tongue, one veal shank, cayenne, salt, pepper, two tablespoonsful catsup.

Boil tongue and veal shank together for three hours, putting it on to boil in cold water. This will draw out all of the gelatin of the veal bone. When tender, skin the tongue, cut in slices or put through a coarse meat grinder. Add salt, pepper, cayenne and catsup, put into a mold and cover mixture with the liquid in which it has been boiled, when cold, turn out on a platter, slice and serve.

Calf's Head-Cheese

One calf's head, one tablespoon herbs, pepper, salt.

Put calf's head in enough water to cover, let come to a boil and boil gently until meat leaves the bone. Take up with a skimmer, put into an earthen bowl, season with salt, pepper and chopped herbs. Lay a cloth in a colander, put minced meat into it. Fold a cloth over the top, weight down with a plate. When cold, slice and serve with mustard.

Potted Liver

Wash and cut up two pounds of beef liver. Cover with cold water, let come to a boil, and simmer until tender. Press through a potato-ricer; add one-half cupful butter, one-half teaspoonful salt, and a dash of pepper. Beat the above mixture to a smooth paste. Mince a good-sized onion and a few sprigs of parsley and stir into the mashed liver. Put in jars in a cold place and it will keep for some time.

Pork Loaf

One pound chopped ham, one pound chopped fresh pork, three tablespoons chopped onion, one tablespoon salt, one teaspoon pepper, one and one-half teaspoons curry powder, one tablespoon sage, one egg, one-third cup cream.

Chop meat and onion and mix together. Add egg and cream. Shape into loaf and tie in cheesecloth. Simmer two and one-half hours in three quarts of boiling water, to which one teaspoon salt and four tablespoons vinegar have been added. Drain, press and cool.

HAY

Under date of July 27, Scott, Magner & Miller says:

Receipts past week, 3142 tons. Although we have not changed the range of prices, if the arrivals continue for a few weeks at the present rate we do not doubt but what a lower range of prices will prevail. At the present, however, most dealers have paid high figures for the hay which is coming in and are therefore making a strenuous attempt at holding the market in order to realize, at least, cost. Reports from country districts show some sales at higher figures than the present range of prices here, considering freight that must be added. Some consumers have been putting in their winter supplies, but the majority are running along with the market.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:

Fancy Wheat Hay, large five wire bale .....26.00@27.00
No. 1 Wheat or Wheat and Oat Hay .....22.00@24.00
No. 2 Wheat or Wheat and Oat Hay .....19.00@21.00
Choice Tame Oat Hay.....24.00@26.00
Other Tame Oat Hay .....21.00@23.00
Wild Oat Hay .....18.00@22.00
Barley Hay .....18.00@22.00
Alfalfa, first cutting .....16.00@20.00
Alfalfa, second cutting .....22.00@24.00
Stock Hay .....18.00@20.00
No. 1 Barley Straw, bale .....50@80

GRAIN

Wheat: Base price for 1918 crop common white hard to farmers is $2.20 per bushel of 60 pounds, delivered in bulk at terminal warehouses. For sacks add 9 cents, less tare for weight of same.

Barley—New No. 1 feed, $2.55@2.60 per cental; milling, $2.65@2.70; off grades quoted down to $2.45.

Oats: Red feed, $2.60@2.65 per cental.

Corn: Nominal; none offering.

SEEDS

Prices in round lots, lb.:

Millet, recleaned.....5@5½
Flax .....8@8½
Hemp .....5½@6
Rape .....2½@5

Citrus Fruit Market

Los Angeles, July 31, 1918.

Auction markets have been very strong. All citrus markets have been helped by a shortage of fresh Eastern fruit. Large sizes have been discriminated against but regulars are in keen demand.

Coming crop is being more closely estimated and it is now thought that Northern and Central California will not have more than a 50 per cent crop, and the Southern crop not far from 70 per cent of normal. As fruit gets larger inside of tree setting is more apparent.

Lemon market is likewise very strong notwithstanding the large supply of forelgns. There are now on docks or afloat not far from 150,000 boxes.

Shipments

Shipments of citrus fruits to date since November 1, 1917: Southern California: oranges 12,491 cars, lemons 4502, total 16,993. To same date last season, oranges 34,726, lemons 6749, total 41,475. Central California this season; oranges 2536, lemons 115, total 2650. Last season to same date; oranges 4655, lemons 164, total 4819. Northern California; oranges 203, last year same date, 845.

AT THE AUCTIONS

July 24

New York: 7 oranges, 1 grapefruit, 4 lem. Oranges higher. Val. 6.70-9.00, grapefruit 3.30-6.45, lem. 5.00-7.60.

St. Louis: 1 Val., 2 lem. Val. 5.15-6.40, lem. 2.85-5.20.

The Why of the Moist Mash

Written for California Cultivator By Jean A. Koethen

THE moist mash occupies a peculiar position among poultry rations. Nobody has much to say in its favor, yet it is almost universally used. Some experts go so far as to condemn it, but the rank and file of poultry keepers go right on using it. They do not all mix it in the same way, nor feed it at the same hour nor to the same class of fowls, but in some shape or other they all use it.

There seems to be no rule in poultry husbandry that may not now and then be broken, no "best" way of doing anything, but the fact is the wet mash has always been used. Long before anybody thought of the dry mash women were mixing bran mashes for their hens. Sometimes they made the mash of bran and hot water. Sometimes they added vegetables, raw or cooked. The poultrymen of the South Coast roaster colony in Massachusetts, long before poultry keeping had attained any standing as either industry or science, daily hauled a big mess of moist mash around to their hens. This was all the hens got except what they picked up on range and a daily feed of grain, and they did wonderfully well.

Tom Barron openly declares that he uses a moist mash and could not get on without it, and most experiment stations, while they do not advocate using the moist mash instead of the dry, recommend a daily meal of moist mash in addition to the dry. This is usually given early in the afternoon, and is, if possible, mixed with sour milk. Sometimes the dry mash which is fed in the hoppers is moistened with the milk, without the addition of anything else. Sometimes vegetables are cooked and the liquor in which they are boiled thickened with ground grain. On one big poultry ranch I found the owner busy mixing his moist mash with semi-solid buttermilk. I think he added cut alfalfa to the mash before feeding. Many persons do. Another man told me he always fed a mash, moistened with buttermilk, to his pullets in the fall. This man fed the mash the last thing at night, when the pullets' crops were already full of grain. The other fed it at two o'clock. A third man soaked rolled barley or oats over night and in the morning mixed it crumbly with the regular dry mash. This man fed in the morning.

The consensus of opinion seems to be, that while the moist mash by no means takes the place of the dry, and while it is perhaps not wise to use it constantly, as an addition to the regular ration, and especially when a little extra stimulation of the appetite is required, as in the case of maturing pullets or molting hens or fattening fryers or chicks that do not grow as they should, there is nothing like it.

For one thing, the moist mash is a convenient vehicle for a greater variety than can be fed satisfactorily in any other way. You may, of course, tumble your table scraps into the run just as they come from the table, set your pans of buttermilk on the ground and throw in your greens just as they come from the stem. Cooked and mixed they are vastly more palatable, and the ground grain mixed with them is just so much extra. Why do we feed grain ground instead of whole anyway? Isn't it just so the hens can digest a greater amount? The addition of the moist mash to the dry gets just that much more mash into the hen's crop, for she will always find a place for what she likes. The moist mash is to her what pie is to man, unnecessary but delectable.

And so it really simmers down to a question of palatability. Mrs. Biddy eats moist mash because she likes it. Why she prefers it to dry is not so easy to say. It may be because of the bits of vegetable or green she is able to fish out. Perhaps it is the element of uncertainty that appeals to her. Perhaps it slips down a bit more easily. Anyway, all chickens like it, and if wisely fed it does them good. The secret of using the moist mash is to give always a little less than the birds want. There must never be any left over. If it stands in the sun and sours the chickens will either eat it at the expense of their health or let it lie and waste. Give them just what they will clean up eagerly and there will be neither indigestion nor waste.

Honey Producers Exchange

The California Honey Producers' Cooperative Exchange has become an entity, having completed its organization in Los Angeles June 30. The Western Honey Bee reports ten local exchanges organized and delegates appointed. The delegates met in the office of State Market Director Weinstock in San Francisco June 26 and formed the preliminary organization, to take the place of the promotion committee appointed by the State Beekeepers' Association.

The board of directors met again on July 15. Temporary officers selected were J. D. Bixby, president; R. F. Gunterman, vice president; M. C. Richter, secretary; L. E. Jacobus, treasurer; A. B. Massey, manager.

Offices have been secured in the new Wholesale Terminal building on Seventh Street, Los Angeles, and the exchange expects to be in shape to handle the bee products of its members by August 1. The following local exchanges have been formed and received their charters from the secretary of state:

Superior California Honey Exchange, comprising Sacramento County and all counties north.

Central Valley Honey Exchange, San Joaquin, Stanislaus and Merced Counties.

Southern San Joaquin Valley Honey Exchange, Madera, Fresno, Kings, Tulare and Kern Counties.

Inyo Honey Exchange, Inyo County.

Los Angeles Honey Producers' Exchange, Los Angeles Conuty.

Orange Belt Honey Exchange, Riverside and San Bernardino Counties.

Orange County Honey Exchange, Orange County.

South Coast Honey Exchange, Ventura and Santa Barbara Counties.

San Diego Cooperative Honey Exchange, San Diego County.

Imperial Honey Exchange, Imperial Valley.

America's glorious privilege is to feed the world while it fights its way to freedom.

The Engine Selected by over 150,000 Farmers

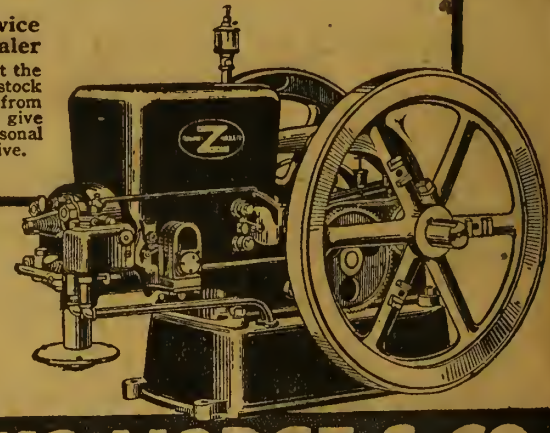
RECORDS made by over 150,000 practical farmers buying over $10,000,000 worth of Fairbanks-Morse "Z" Farm Engines have never been equaled in Engine history.

Demand, as they did:

1. Fairbanks-Morse Quality.
2. Economy in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun-barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

You Also Get Service from your Local Dealer

Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.



The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H.P. size uses gasoline only.

FAIRBANKS, MORSE & CO.

Chicago — Manufacturers

Farm for Profit

and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A private room for every calf may hardly be essential, but the dairyman at the State Polytechnic School, San Luis Obispo, finds more satisfactory results in raising valuable calves by giving to each his quarters exclusively. He says there is less chewing of ears and chasing around the yard, which causes some discontent if not injury. Hence the pens shown in the cover illustration this issue. At nominal expense a narrow extended runway with a bit of shade is given to each, that is, excepting in case of overcrowding, when like dispositioned youngsters are sometimes put together.

The scheme may not be readily adapted to all ranches but offers a suggestion to the careful breeder.

This photo, also the others on third page of this issue, taken with the Cultivator camera.

SAVING SUGAR?

A few months ago when Lord Rhonnda was alive and food director of England he was informed by his department heads that the amount of wheat which America had estimated after the last harvest as available for export had been exhausted. He threw up his hands and said: "The war is lost." In fact, he sent a cable to that effect to Food Administrator Hoover. Hoover replied that Americans were ready to do more than had been expected of them and more wheat would be sent. Then followed the most strenuous voluntary food conservation campaign which this world has ever seen. Thousands of large hotels and food distributors and thousands of families volunteered total abstinence from wheat products. England, France and Italy were supplied with wheat; their fighters were kept fit; and we are winning the war.

Now about sugar. The Italians are allowed one pound per month each; the French, one pound and a half; Americans are still allowed two pounds each and, in addition, such amount of canning sugar as is necessary. Grocers are selling under most rigid regulations, and it will be increasingly difficult to secure more than our share, but regardless of regulations we must win the war, and sugar is a factor. Are we voluntarily saving on sugar?

KEEP YOUR BOND

During the past week the papers have referred to a three year sentence in federal prison for a Liberty Bond speculator who in order to secure more satisfactory terms made claims that America would be unable to win and that Liberty Bonds would be of little value when Berlin had finished with us. He succeeded in purchasing some $100 bonds for $85. There will probably be no other such flagrant case of disloyalty, at least in this matter of bonds. Notwithstanding that, there will be many who may be easily discouraged or wish immediate spending money, who will throw their bonds, in fact are doing so today, on the market at a slight discount. The chamber of commerce of the United States is giving the warning and urges:

"Don't be swindled out of your Liberty Bond.

"If anyone tries to trade you out of your Liberty Bond, don't trade.

"If tempted to consider a trade take the trader to the nearest bank and ask the banker to check the value of the thing offered.

"If you must absolutely have the money your bond can always be sold for cash in the open market and the daily papers will tell you what it is worth.

"Keep your bond until the end of the war. Go without something you need rather than sell it. Your bond is your substitute on the fighting front. To part with it takes you out of the fight.

"Instead of selling the bond you own buy another one to keep the first one company.

"Liberty Bonds are the best security on earth today.

"They are the promise of the United States government to pay you interest twice a year and to pay the face value of the bonds when due. Their safety is the reason they carry a low rate of interest. Detach each coupon on the date it bears, take it to a bank and deposit it to your account, or draw the cash value.

"Register your bonds, and keep them where they cannot be lost, stolen or destroyed. Go to a bank for information—many banks offer facilities for safe keeping of bonds. To lose an unregistered bond is the same as to lose that amount of money."

CREDIT CREDITABLE

Editor Saylor of the Pacific Dairy Review gets off entirely on the wrong foot when he says: "A local paper in one of our California farming communities seems to take considerable pride in the fact that its community leads in making loans through the federal land bank. It seems to us this enterprise is in the wrong direction. Borrowing may be necessary at times, but it is seldom anything to blow about."

If the world's business, either in peace or war, were all transacted on a strictly cash basis and left in the hands of only those who had cash to conduct business, there would be a vast shrinkage in commercial transactions. The man who does not use credit to enlarge his business transactions may not because of fortunate circumstance which has placed sufficient capital in his hands, or it may be because he has no credit.

The fact that the government of the United States or, more directly, the federal land bank, is willing to lend largely to the people of any community, indicates belief in the inherent value of the land; also that it is farmed by people of ability to pay out the loan. The borrowing of funds to be used in the purchase of a joy wagon might well be considered nothing "to blow about," but the borrowing of funds for the purchase of better farm equipment, even if a part of that equipment is an auto or trailer which aids in swifter marketing of cream or other perishable product, is not only wisdom, but a most patriotic act these days when labor shortage is one of the farmer's most perplexing problems.

VOLUNTEER—SELECTIVE

A young man of draft age in the superior court of Los Angeles County confessed to a crime with which he had been charged and requested of the judge that he be sentenced to the army. The judge quickly declined, sentenced the prisoner to several years in the state penitentiary and informed him that the United States army is not a place for law violators, but is filled with some of the best blood of America. This reminds us that we have often heard volunteers in the service call attention to the fact that their particular company, regiment or division is made up of quite exclusive best young people of the country because of the fact that they are volunteers. We wish to take no honor from the young men who are volunteering their services and even their lives; likewise there must be equal honor given to those who have been selected by the United States to support its flag, and any reference to their service which lowers the honors due to them should be discouraged.

BONDS SOLD

The federal land bank announces that there are now farm loan associations in all the states of the Union. The associations total 3100. The Wichita district leads with a total of 398 associations. The Berkeley bank totals 145, 106 of which associations are in California, making California one of the leaders in organizing associations. The farm loan board announces that all the first issue of bonds, $60,000,000, has been sold, and for the time being no more bonds are to be had except from the original purchasers who are now demanding a premium. Another issue will be made next November.

This Week's War Notes

"Huns in New Retreat" has been scare headline in daily papers nearly every day during the past week. The Allies are apparently following the retreating Germans very cautiously, but every day notes advances. Fere en Tardenois and Soissons, both important munition distributing points of the Germans, have been captured during the week. It had been expected that the enemy would dig in at the Vesle and refuse further retreat. As the Vesle was reached the fighting has been more severe, but already the Allies have crossed it in several places. Americans are in the thickest of the fight. The list of casualties to American boys has been immensely lengthened, and columns in the daily press are now required to give list of killed and seriously wounded. The first criticism of the behavior of the American troops is yet to come; only highest praise is given. The line in Belgium and Picardy has been more quiet, though the English have advanced in a few short sectors and artillery has been active.

Allied forces are being landed at Archangel, and a strong detachment of Allied troops is now at Kola, farther north. There are American troops at both places. The population of Archangel received the troops with great enthusiasm. Diplomatic representatives of Allied governments are leaving Vologda, forced to that step by the Bolshevik government which six weeks ago ordered all cable communications stopped between Allied ministers and their governments. Bolshevik forces which were near Archangel have been driven farther south; they carried away 40,000,000 roubles. On the Eastern coast Bolshevik forces north of Vladivostock are known to be receiving reinforcements.

The Germans are finding great difficulty in organizing the productive interests of southern Russia, especially in the Ukraine, and even the German and Austrian soldiers are continually manifesting hatred for each other. At one point an army of 25,000 Russian peasants is being armed, who burn their own houses and stores rather than let them fall into the hands of the Germans.

The new draft law soon to be passed will probably raise the draft age and it will stand at 18 to 45. Provost-Marshall-General Crowder urges the immediate passage of the bill and suggests September 5 as registration day.

Field Marshall Haig, on the war's anniversary, declared: "The war's crisis is passed; the steady stream of American troops is bringing the Kaiser's downfall."

Tokio has officially announced her intention of sending troops to Siberia and aiding in the restoration of Russia, and it is declared; "No Russian soil will be retained by Japan."

Submarines are still on the western side of the Atlantic. Occasional sinkings are reported, and many now believe that the sinking of the San Diego was due to a submarine.

Oakland has won the world's record during the past week, launching the great steel cargo carrier Invincible, 12,000 tons capacity, in 24 days from laying keel.

There will be 2,000,000 American troops in France before the first of October, and promise is made that an army of at least 5,000,000 will be in training at home.

"The enemy evaded us, and we thereupon broke off operations and retired fully masters of the situation" is report of Gen. Ludendorf.

The line running from Saloniki to the Adriatic has been comparatively quiet, though rumor persists that important advance will be made.

Liberty Bonds of the first issue have sold during the past week at par in open market of New York.

Great Britain has raised 7,000,000 men for the war, 5,000,000 of whom are fighting on foreign soil.

"Hold fast" is Lloyd George's anniversary message to his own people.

More than 250,000 Christian Greeks have been deported by the Turks.

Making Better Farmers of California Boys and Girls

By C. B. Messenger

MAKING the school house a feature of the community life is one of the aims of California Polytechnic School at San Luis Obispo. This school is an entirely independent state school operating under a special act of the legislature passed in 1901. This school was organized for the purpose of providing practical training for young men and women of the state who desire instruction more closely identified with the farm, the shop and the home than is that of the ordinary high school. This perhaps accounts for the interest manifested in the immediately surrounding homes and farms. Of course, the high school and all schools of the country are taking more interest in the home life of their pupils than was the case a few years ago. School houses, formerly as tightly closed as was the "front parlor" of the olden days, are today a neighborhood gathering place.

But San Luis Obispo Polytechnic, devoting largely of its activities to agricultural training, is brought closer to an agricultural community than are the other schools. In this respect it is uniting with the state university in encouraging the university pig clubs or any other club or movement which looks towards higher and better production. This school encourages installation of silos and the formation of cow testing clubs. It is urging farmers to keep books and to know cost accounting.

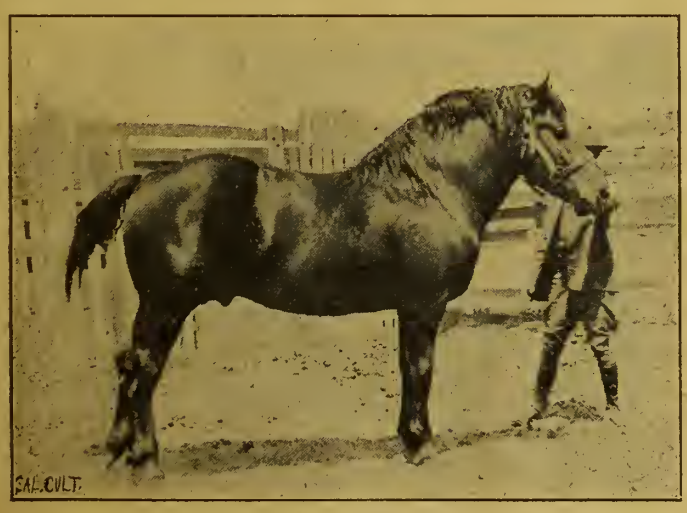
The direct influence on the home life is shown by incidents such as this, referred to by Director R. W. Ryder in a few moments' conversation with the writer at the school recently. One young man not far from 16 years of age, born on a San Luis Obispo County farm handled by his father for many years and producing only indifferent results, through the influence of his mother was permitted to attend the Polytechnic and, believing his text books and instructors, went home at vacation time with urgent request to his father for deeper plowing on the farm. The father had farmed many years by the old time methods and he persisted. Finally he gave the boy one acre as a test plot. One year's experiment convinced the father, and now the boy is the "foreman" of the ranch, more productive than formerly.

One striking feature of the Polytechnic School is the reduction in the age of the attendants. The first few years of the school the pupils were almost entirely young men 21 to 23 years old, or young farmers who felt the need of better training before going on with their farm work. Now the average is around 15 years, and last year no boy attended the school who was not under 18 years of age.

The character of the influence and technical training of the school is shown by the fact that 135 of its former attendants and graduates are now in the service, most of them either in the aviation or engineering divisions and many already having commissions. Notwithstanding war conditions, the school anticipates next year enrolling 200 to 250.

R. W. Ryder

Director of the California Polytechnic School at San Luis Obispo. Prof. Ryder has been in charge of the school for several years, and in addition to being an educator is a most practical farmer, personally conducting the affairs of his own ranch.



Polytechnic Percheron

Notwithstanding the director of the school believes the demand for the medium sized horse will continue to increase, good types of Percherons and Shires are retained on the school farm for educational purposes. The school also has high types of saddlers and light buggy horses.

A Renewed Silo

This is one of the older types of cheaply constructed silos. It worked satisfactorily several years when it became so leaky that it was a candidate for the discard. The director of the school, anxious to save expense of building a modern silo at that time, conceived the idea of lining it with roofing paper. Ordinary three ply roofing was secured, and the inside of the silo was lined from top to bottom, the same method of applying the paper as if for a regular roof. This has been given some three years test with the result that the silage is keeping perfectly. The cost was between $1.25 and $1.50 per square of 100 feet.

The school is conducted like a big farm home. The girls have their domestic science, with practical instructors. The boys devote part of their day to technical school work and more to practical farm or shop operations. There are pure bred Jerseys and Holsteins, Poland-Chinas and Berkshires, Percherons and Shires, even the poultry being well bred. Tractors and up-to-date implements are handled by the boys in farm operations. Each attendant is expected to operate on an acre or less of ground and to produce practical results with a minimum expenditure of effort.

There were formerly 311 acres in the farm, but a recent purchase has added 625 more, making nearly 1000 acres, much of it tillable for practical farming operations. Director Ryder believes in the boys keeping account of the results of their own efforts and knowing how much each farm operation costs and how much it returns. More, he believes in boys and girls of California being bigger and better than boys and girls of former generations.

THE INTERSTATE QUARANTINE CONFERENCE

Commissioner Hecke writes that he is in receipt of a recent communication from the governor of Lower California in regard to the coming interstate quarantine convention to be held in Riverside in November. Governor Cantu has expressed himself as greatly in favor of such a convention and states that he will be pleased to have Lower California represented thereat. With the receipt of Governor Cantu's letter a complete list of the Rocky Mountain and Pacific states, Canada, Hawaii and Lower California have recorded a unanimous opinion in favor of such a convention and have expressed a desire to be represented. The official invitations have been sent out by Governor Stephens to the governors of all the states above mentioned, asking them to send delegates to the conference. Among the suggestions which have already been received from the different states as to the points which should be brought up are—first, what constitutes an infestation; second, the subject of uniform inspection methods.

Maternity Pens

Side hill construction is responsible for the stepping-down appearance of these roofs. The runways are on the opposite side of the houses. The small enclosures on the side toward the observer are concrete with shallow wallow, or dip, built in the concrete. At time of farrowing the wallows are emptied, but before farrowing the sow has the choice of the concrete feeding floor or the wallow, the interior of the house, or the freer range of large corrals beyond.

Agricultural News Notes of the Pacific Coast

Northern California

Experiments in cotton raising in Yolo County have been very successful.

The Sutter-Butte Canal Company is making improvements in the heading and dam at Pacific Heights.

The cannery at Yuba City, Sutter County, is now running full handed, principally on peaches.

The El Dorado County farm bureau has secured a tractor threshing outfit. Work has begun in the Fair Play district.

State Viticultural Commissioner Jeffrey is visiting vineyard sections of the state, looking over crop conditions.

The El Dorado farm center has asked government investigation of the proposed irrigation district in the county.

California dried fruit packers will allow only one cent per pound manufacturing and packing cost on 50-pound boxes.

Farm Adviser Amundsen of Placer County is spending his vacation studying blight resistant pear stocks in Southern Oregon.

The plant of the Olive Products Company at Oroville will be enlarged so that it can operate throughout the year on other products.

Pear growers who were held by term contracts have been allowed $10 more per ton through the good offices of the food administration.

Vineyardists of California have appealed to the President to save the wine industry of the state from confiscation through prohibition.

The livestock marketing committee of the Sonoma County farm bureau is planning for a series of auction sales of livestock, particularly hogs.

Yuba County farmers are investigating grain handling methods, and it is predicted another year will see a large number of elevators erected.

Red Bluff wool growers are receiving checks direct from the government for wool clip. Prices are averaging around 74½ cents and return is made for wool sacks at the rate of 50 cents each.

The Placer County farm bureau Weekly compliments the fire fighters of Lincoln and other sections because of quick response and effective work at various field fires.

Butte County objects because in apportioning the sugar to the county the food administration has done so on the basis of 25,000 population. This only gives 50,000 pounds for the month of August, whereas the requirements of the country called for 125,000 for the month of July.

The California railroad commission has served notice on a large number of electric power companies in Northern and Central California in effect that during August and September, except Saturdays, Sundays and legal holidays, no electrical energy shall be used for advertisements, ornamental lighting, etc.

Yolo county is planning a new squirrel offensive. County Horticultural Commissioner Gould says: "The grain is practically all cut, and the distribution of the poison will get better results than at any other period of the year. Every farmer will be expected to lend full cooperation. It is estimated that each pest ruins a dollar's worth of crops each year."

Central California

Merced County farm bureau is organizing wool pools.

F. G. Tiffany is new assistant farm adviser in Merced County.

The alfalfa catterpillar is proving a serious pest in alfalfa fields of Kern County.

The Kern County farm bureau held an auction of fat hogs at Wasco, July 20.

Madera County's new farm adviser, Mr. Smyth, has taken charge. He is assisted by Harry Drobish.

An auto driver hitting 40 miles per hour on state highway had to dig up a $50 fine in Fresno County.

The bureau of markets is appealing to California peach growers to dry every peach and let none waste.

Tulare County is making liberal fresh grape shipments. One plant at Woodlake will ship at least 60 cars.

Watsonville reports presence of cottony cushion scale and is endeavoring to secure sufficient vedalia to control the pest.

"Don't pick your grapes too early" is warning sent to all table grape growers. The percentage of sugar must come up to legal requirements.

Saloons in Monterey within the half-mile limit from military camp have been closed by federal order. This order also affects the Hotel del Monte.

Tuolumne County cannot collect taxes on dams and reservoirs of districts in another county is the ruling of the superior court of Tuolumne County.

The Visalia sugar factory, recently made the largest run in its history, sacking during the 24 hours 1560 sacks of sugar. The factory is as yet holding for instructions from Washington as to shipping.

Merced County farm center meetings: Irwin-Riverside, August 13; Delphi-Youngstown school, 14; Amsterdam, 16; directors, 17; Eschscholtzia, 22; El Nido, 28.

"No licensee is permitted to pay grower directly or indirectly prices in excess of those recommended by the food administration" is ruling of Fresno County food administrator.

At the recent annual meeting of the San Joaquin Valley Veterinary Medical Association, L. A. Danielson was elected president, and Dr. R. A. Ball of Fresno, secretary-tereasurer.

Several horticultural commissioners of the central part of the state aided in a raid on fruit shops in San Francisco recently, at which time hundreds of boxes of fruit were seized and condemned because of fruit pests.

Farm bureau directors of Merced County have arranged a scale of wages which the farmers unite in paying: Workers in hay, corn and bean harvest and irrigation, $3.00 per ten hour day; general farm, orchard and vineyard work, $2.50.

Cattlemen of Contra Costa, Alameda, Santa Clara, San Francisco, San Mateo, San Benito, Monterey, San Luis Obispo and Santa Cruz Counties, comprising zone No. 3 of the California Cattlemen's Association, met in Salinas on Friday, July 19, to discuss matters of interest to the cattle industry.

Southern California

Yucaipa is making plans for its fall apple show.

Over 300 tons of Hemet apricots were made into jam.

The tomato cannery at Hueneme began operations August 1.

The Oxnard sugar factory begins operation Monday, August 19.

Lemon growers near Oxnard are forming a shipping exchange.

The Ventura County Fair is planning to have a big tractor show.

California's production of pink beans will be the largest in its history.

Ventura County's fair management is planning for a big fair, September 30-October 5.

On the biggest apricot day of the season the Hemet canneries received 288 tons of fruit.

The University Citrus Experiment Station recently conducted fumigation demonstration at Santa Paula, Ventura County.

One apricot grower of Camarillo harvested 50 tons of green fruit against 650 last year.

Yucaipa and Beaumont apple growing districts estimate their output this season at about 25,000 boxes.

The interest in milch goats is increasing, and the recent exhibit at Covina afforded opportunity for many sales.

Sugar beets grown in Chino, San Bernardino County, section will all be shipped to the American Sugar Factory at Oxnard.

Inspector Redding reports some fire blight showing in the apple orchards of Yucaipa Valley, especially among Rome Beauties.

The Los Angeles city council has refused to amend its present bee ordinance prohibiting the keeping of bees within the city limits.

Several people along the Santa Barbara County coast have engaged in burning kelp gathered along ocean front, using the ash in potash production.

Despite many pests which have affected the Lima bean fields of Ventura County "Limas have never looked better" is reported of many of the districts.

Hemet, Riverside County, reports its apricot season as the shortest, lasting only about three weeks. The total crop of the valley was about 8500 tons.

It required 14 large buses to take away from Hemet and San Jacinto Women's Land Army helpers who had finished their season of work in the apricot orchards.

A representative of the state horticultural commission has been visiting various apple sections of the southern part of the state giving instructions as to requirements of the apple standardization act.

Now comes a new bean pest in the Zelzah fields. The pod turns yellow, careful examination showing red spot which is caused by puncture of a little red or brown bug. The pod usually contains small worm.

Bean growers of the southern part of the state will be more closely identified with cooperative marketing operations than ever before. The output will be immense, at least 100 per cent greater than 1916 or 1917 crop.

The Coast and General

Idaho farm bureaus are working for greater number of silos.

Utah ranges are getting dry and irrigation water low.

Idaho's fruit crop is little over 25 per cent of normal.

Nampa, Idaho, will hold a harvest festival September 17-21.

Many cherry orchards in New York had women pickers only this year.

The interstate fair will be held at Spokane, Washington, September 2-7.

Wool men of Idaho are protesting against prices fixed by hay growers.

Arizona has closed its cantaloupe shipping with record breaking output.

The Wenatchee Valley of Washington will this year ship 135 cars of apricots.

The Italian silk industry is recovering, and it is hoped it will soon be at normal.

New Mexico has discovered that the yucca plant of the desert has possibilities as stock feed.

"Beans and grain sorghums in southeast part of state are fair" is report from Arizona.

The food administration reports that the government will soon be in the market for 1918 beans.

Mutton producers of Western Texas are exceptionally prosperous because of long spring lamb prices.

Colorado potato shippers have formed an association to work in connection with the food administration.

Tasmania has sent a pomologist to Pacific Coast states to study fruits which may be adapted to that country.

Hawaii has a big crop of pineapples this year. It is expected that 1,000,000 more cases will be packed than last year.

Yakima, Washington, has finished its potato evaporating campaign. Over 6000 tons of potatoes were processed, which produced 1000 tons of dried material.

The food administration urges maximum amount of canning fruits and vegetables with minimum amount of sugar.

County agricultural agents of Idaho are striving to get sufficient amount of grain to feed the increased number of hogs.

Cotton fields in the Chandler district of Oregon show a 90 per cent perfect stand. There are 11,000 acres planted.

New Zealand exported $34,000,000 worth of butter during the past year. It required 42 steamers to transport this product.

The Texas peach harvest is now at its peak. It is expected that the Elberta shipments will run to 1000 cars this season.

The food administrator of Arizona has seized hundreds of pounds of hoarded sugar and flour from Mexicans at Sonora.

The Idaho-Oregon Honey Producers Association has named minimum prices on honey: Extracted, 18 cents per pound; comb fancy, $4.50 per case.

Washington reports the cool weather of May and June unfavorable to fruit production. The June drop has been very heavy and the depredations of aphis and worms have been serious.

What Shall The Harvest Be?

By Arthur L. Dahl

FOOD will win the war! From a mere slogan that sounded good to the ear, these words have grown to mean the serious purpose of this country, for food is short, not only in the war devastated countries of Europe, but in the midst of our own country. True, it is not short because we have not enough food to serve our own needs if we wanted to take a selfish stand and let the rest of the world starve, but as the commissary department for all the Allies and many of the neutral nations, we must forego that superabundance to which we are accustomed to help out the needy ones abroad. And we are all glad to do it, too, and the problem that now confronts the producers is how to grow enough grain and other food crops to meet the demands of the coming year.

Man power is needed on the farm as it is needed in the factory. When the supply does not keep pace with the demand in a manufacturing concern they make machines to do more work in a shorter time to make up for the shortage in human labor. On the farm the war has drawn heavily upon the sons and the laborers who till the soil and supply the power for producing crops, and in their time of need the farmers are turning to machinery to replace man power on the farm as it has in the factory. The tractor is taking the place of the hired man and the horses because, being a machine and untiring, it can work harder and for longer hours than human or animal power, and it is the most efficient substitute for the lacking men that can be found.

The tractor is revolutionizing agricultural work, just as the automobile has enlarged and broadened the life of the farmer and his family, for the tractor enables one person to direct more power than under old fashioned practices where horses alone were used. One man is needed to drive a team of horses and direct their operations, and the number of horses that can be handled by one man is limited to a very few. The tractor is developed to furnish a sustained power hour after hour, and up to the limit of its capacity it will chug along for long periods of time, requiring no rest and operating under climatic conditions which often put horses out of business. Neither extreme heat nor cold affects the tractor, and owing to its being equipped with endless belt or track-laying types of wheels, the tractor can operate on soft ground that would mire horses. The machines are now being largely used in rice fields where it is necessary to get onto the land for harvesting purposes as soon after the water is drained from the fields as possible, and in rice culture tractors are successfully used in mud where it is necessary to equip the cutting machines with pontoons.

The farmer with limited help at his command can be assured of getting his work done in time if he depends upon machinery, for farming is essentially a mechanical operation. The work of plowing, harrowing, cultivating and harvesting all depends upon power, and the most primitive, laborious and unscientific power is that furnished by the muscles of men, while the most uniform, scientific and satisfactory power is that derived from machinery. A modern tractor can do practically everything a horse can, and it can do a great many things impossible with the horse. In plowing the results obtained by a tractor are superior to those secured with horses, because, possessing more power, the plows can be forced deeper and the field, when plowed, will be uniform throughout, thus insuring better growing conditions for crops. It has been the experience of many farmers that increased yields, both in quantity and quality, have followed the use of tractors.

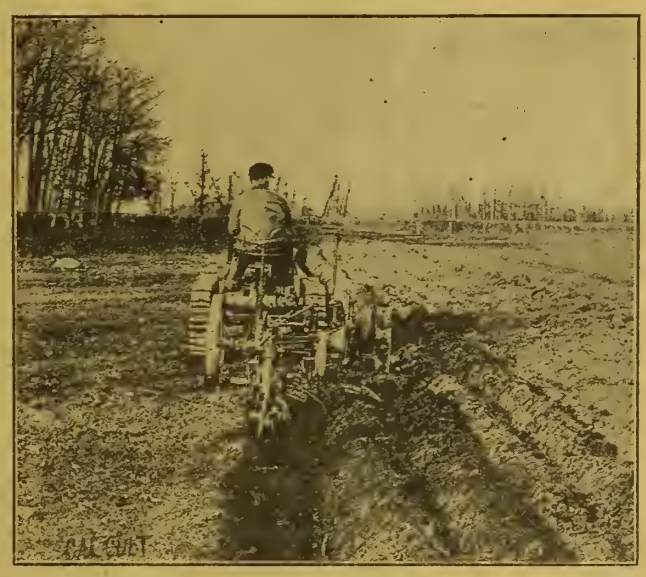
Machinery saves the time of the farmers during those periods when they are the busiest, and often the time so saved means the difference between a good crop and a poor one. In the matter of plowing, for instance, a modern tractor of the heavier type will pull a battery of three or four plows, all of which can be operated by the man in charge of the tractor. That same man, if driving horses, could only handle one plow, and both man and horses would require frequent rests during the day. The tractor with its battery of plows can work on continuously day and night until the field is plowed, and thus much valuable time is saved. Where weather conditions have retarded the work of plowing, or where winter sowing has been a failure and it is desired to plant the same field in the spring, the tractor has been of immense help to farmers in enabling them to get their work done promptly.

Tractor as Hay Loader

More and more the tractor is working in to nearly all phases of farming

The development of the tractor has also meant the development of other kinds of farm machinery, for new plows and harrows and cultivators have been designed to be used with tractor power, and many of these are so built that they can be operated from the tractor seat, thus doing away with extra help. So easily are the various levers manipulated that many women and the young daughters of the farmers owning machines now run the tractor outfits.

In possessing a tractor the modern farmer has a source of power which is available for a great many different purposes. The actual field work incident to the growing of any crop does not require all the time of a farmer and his equipment. There are long periods during the growing season when nothing is needed to be done in the fields, and during these periods the tractor owner can utilize the engine in his machine for doing belt work. It can be harnessed to a pump to fill water tanks or reservoirs, or power can be furnished to grind feed, crush limestone, saw wood, or a dozen other valuable uses. The many different ways in which tractors can be used increase their value, because with machinery, the longer the period of its operation the greater the efficiency obtained, and many owners of small farms who would not be justified in buying a tractor for field work find them a profitable investment when all the things accomplished are taken into consideration. In some communities the owner of a tractor will do work on adjoining farms under contract, thus helping him to pay for the machine and at the same time helping out his neighbors who need special work done. An increasing number of young men are also purchasing tractors and are going through the agricultural districts and doing plowing and other work for farmers at so much an acre. During the fall and winter months these men use their machines for sawing wood or grinding limestone or other work required by the local settlers.



Plenty of Power—Good Results

This is a good season of the year for fitting the ground for the coming planting, but it takes proper implements and sufficient power.

Tractors are also largely used for hauling big loads of grain or other farm products to market. Possessing great power, one of these machines is capable of hauling as many as half a dozen loaded wagons, and where heavy hauling is concerned the tractors can successfully compete with trucks or horses because of the saving of man power needed to operate them.

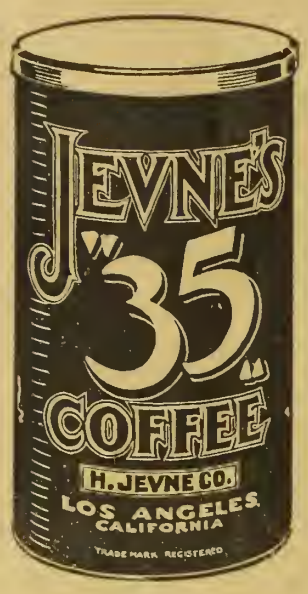
From a psychological standpoint the use of tractors and other farm machinery in agricultural work has resulted in keeping hired help for longer periods than where horses and old fashioned methods are used. Many farmers report that their men take unusual interest in operating machinery, and they accomplish more work and seem better satisfied with conditions where tractors are used instead of horses. This is probably due to the fact that most men like to run mechanical things, and in operating farm machinery the monotony and drudgery are taken out and the men find many things to interest them in performing their daily tasks. The hum of the machinery and the speed and regularity with which they see their work being done give an added impulse to greater accomplishments, and that element in human nature which is at the foundation of better work is appealed to in the men.

The tractor is still in its infancy, and during the years to come there will doubtless be many improvements made in the form and working abilities of these machines, but even now it is the most valuable tool on the farm and its use will go far towards enabling the farmer to accomplish maximum results with the minimum of effort, and in these days of scarcity of man power the tractor is the most satisfactory and dependable farm hand obtainable.

AMERICAN FARMERS MUST GROW SEEDS FORMERLY IMPORTED

War conditions have made it necessary for the United States to produce at home seed supplies that formerly were imported from Europe. "Temporary seed shortages have developed under new economic conditions, and they may continue," says the United States department of agriculture in "The Seed Supply of the Nation," a new publication recently issued as Yearbook Separate 757, "but farmers and seedsmen are resourceful and they may be expected to find ways and means to meet not only the needs of this country, but also those of other countries which may be dependent upon us."

Although, as a matter of necessity, seed production has increased in this country since the war, the experts of the department state that the possibilities of commercial seed growing in the United States have only been slightly developed. The publication mentioned may be obtained by seedsmen and those especially interested. It discusses at length the various American farm crops, from a viewpoint of seed supply.



A Lot of People buy twenty cent coffee because it costs twenty cents

But the family that drinks coffee for the aroma and flavor enjoyed at the table---wanting a coffee that suits its taste and pride, buys *Jevne's Coffee*

And too, some brands of coffee ought to be served in the sugar bowl or cream pitcher. All coffees make approximately the same number of cups to the pound, but *good* coffee requires less sugar and cream to meet your taste requirements. The thrifty housewife buys *Jevne's Coffee*---it's *good* coffee and needs less sugar and cream.

From a Californian in Tripoli

MANY Californians will recall with pleasure Dr. F. Franceschi, who for years lived at Santa Barbara, establishing there the Plant Introduction Gardens which were responsible for the bringing to California of rare plants from many parts of the world. Later he moved to Montarioso Heights and established the Montarioso Nursery.

Perhaps one of the best known of Dr. Franceschi's introductions is lippia repens which he secured from Italy and which has proved almost a wonder on ordinarily barren hillsides or in lawns where there is heavy tramping and wear.

Dr. Franceschi, or Fenzi, as he is now known, is in the service of Italy in Tripoli, having to do with plant introduction and, we believe, with general management of large colonization schemes in Tripoli. Some months ago we wrote Dr. Fenzi requesting information as to things agricultural in Northern Africa, and he writes:

"Your favor of February 2nd reached here with great delay, as it is usual now for all mail from California, and from everywhere. I must apologize very sincerely for my neglect, not entirely dependent from 'oriental environment', but principally by lack of matter worth to write about.

"Owing to the state of mutual blockade which has existed here since May, 1915, that is the rebels blockaded by us from the sea side, while they blockaded us from the inside, you may well imagine that not much could be accomplished up to now, and will not before the end of the war. Yet, something was done, and among other things the problem of reforestation was successfully taken up by planting of eucalyptus windbreaks. It has been proved by actual experience tbat it is quite possible to establish 'gums' in the so-called 'desert', and even on moving sands, by planting them during the winter, and without watering them at all afterwards. Several kinds were tried, of which the 'red gum' (E. rostrata) is the most promising, while the 'blue gum' is a complete failure.

"I must express my sinceres tthanks for the Cultivator, of which only a very few numbers did not reach me, and I can assure you that it is always most welcome, not only to me, but also to my wife and daughter. It is always full of interesting matter, and it makes us feel in touch with never forgettable California, while we are particularly admiring its practical and most efficient work in behalf of the war.

"The country which is now known as Libya stretches from east to west on the northern coast of Africa, between Egypt and the Regency of Tunis, reaching south of the 25 degree parallel, and occupying a surface of 1,500,000 square kilometers, that is about ten times as large as California. Most of this surface is now called desert, but it is not true desert wherever water can be brought to cooperate with the sun and foster vegetation. There are no rivers in Libya and no high mountains, except near its southern border, but there is plenty of water stored underground, owing to the winter rains. These amount to about the same as at Los Angeles, and on account of the geological and physical conditions of the soil, they all soak in, being prevented from running down to the sea. It has been calculated that on the coast region of Tripolitania proper, namely from the Great Syrt to the French boundary line, some 17,500,000,000 cubic meters of water are stored on an average every winter, which are available for irrigating about 300,000 square kilometers of good, tillable, frostless land. It is in this region that Italy is now taking her first steps of colonization.

"Just like in Southern California the culture of fruit trees is sure to prove the most profitable in Libya, and almost every one of them will be in common to both countries. But, on the standpoint of colonization, the greatest difference exists in their demographic conditions. In fact, when in 1848 California was annexed by the United States the bulk of its surface was practically government land, and its inhabitants were only a very few thousand harmless aboriginal Indians or Mexican Spaniards, while the population of Libya cannot be estimated much under one million, and a rather thorublesome people at that. The records left by Sallustius and Julius Caesar two thousand years ago are fitting exactly the Libyans of today, with the aggravating circumstances that mohamaddan fanatism and intolerance were since grafted on top of their far from commendable native qualities. It has been shown however, by the experience of these last three years that the sedentary population, thickly settled as it is on the limited areas of the Oases along the coast, if properly handled, will prove peaceful enough, and susceptible to a certain extent of agricultural progress.

"The rebellion of 1915, started by German gold and kept up by German submarines, has improved in one way our possibilities of colonization, having swept away almost all claims of the nomadic tribes to pasture on sections well capable of culture. Plenty of pastures are left for them further in land, away from the coast, and efficient means are sure to be adopted to prevent repetition of troubles. When the world's war will be over, and a perennial stream of vigorous, industrious Italian peasants will be headed this way, the work of colonization will steadily proceed, starting alongside the railways, of which more than 200 kilometers are now built."

JUNE DROP

By R. R. Snowden

Referring to your editorial in July 27th number on the June drop of oranges: Among the "numberless other things and conditions" which might cause the June drop, I wish to mention prominently this one in particular, namely, a deficiency in the soil of one or more of the elements necessary to the formation of the proteids. Those most likely to become deficient are sulphur, phosphorus and nitrogen. More than six years ago the writer discovered the importance of sulphur in this respect, and since then has many times demonstrated the correctness of his conclusions. For instance, after a deficiency of sulphur was found by analysis in the soil of H. E. Gilley's orange grove in Tulare County the grove was given treatment to supply simply this one need. Note the result: His last season's crop was 65 per cent of full, while all the neighboring groves produced but 15 per cent crops.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards six times they will not be affected by mildew or red spiders.

FLEUR DE SOUFRE AND ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, packed in double sacks, are the fluffiest and purest sulphurs that money can buy; the best for orchards and vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—Atomic Sulphur and for dry dusting.

For Lime Sulphur Solution, use our DIAMOND S BRAND Refined Flour Sulphur, which we will furnish at a price so cheap that you cannot afford to purchase ready-made solutions.

We are equipped to make immediate shipment. Send for illustrated booklet; also price-list and samples.

Gardner's Bean Harvester

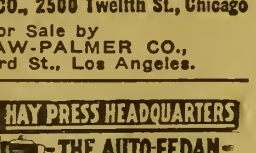
meets the requirements of the rancher and is within easy reach of all.

Ask your dealer about it, or send direct to factory.

Gardner Harvester Co.
900 E. Fourth St., Santa Ana, Cal.

THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

FRUITS GROWN IN DIFFERENT COUNTIES

From report of Chief Deputy Horticultural Commissioner Weldon on estimated per cent of normal fruit crop grown in main producing counties of the state:

Almonds.

San Joaquin and Yolo Counties, each 4 per cent; Butte 13, Contra Costa 10, Sacramento 8, Sutter 8, Stanislaus 7, Solano 5, Colusa 4, Riverside 4, Merced 2, Alameda, Glenn, Lake, Los Angeles, Napa, Placer, San Benito, San Luis Obispo, Santa Clara, Tehama, Yuba, 1 each.

Apples.

Santa Cruz 51 per cent, Sonoma 16, Monterey 12, Nevada 3, San Bernardino 4, Humboldt 2, Los Angeles 2, Butte 1, Inyo 1, Mendocino 1, Napa 1, Placer 1, Riverside 1, San Benito 1, San Diego 1, Siskiyou 1, Tehama 1.

Apricots.

Santa Clara 20 per cent, Ventura 10, Alameda 8, Kings 8, Riverside 8, San Bernardino 6, Los Angeles 5, San Benito 5, Fresno 4, Orange 3, Solano 3, Yolo 3, San Joaquin 2, Santa Cruz 2, Contra Costa, Glenn, Kern, Madera, Merced, Monterey, Napa, Sacramento, San Diego, Sonoma, Stanislaus, Tehama, Tulare 1 each.

Cherries.

Santa Clara 24 per cent, San Joaquin 15, Placer 10, Solano 9, Alameda 8, Sonoma 7, Sacramento 6, Napa 4, Contra Costa 3, Riverside 2, Santa Cruz 2, Butte, Nevada, San Benito, San Bernardino, Santa Barbara, Siskiyou, Stanislaus, Sutter, 1 each.

Figs.

Fresno 60 per cent, Merced 10, Tulare 10, Stanislaus 5, Sutter 3, Yolo 3, Butte, Los Angeles, Madera, Yuba 2 each, San Joaquin 1.

Lemons.

Los Angeles 31 per cent, Riverside 16, Ventura 15, San Bernardino 13, San Diego 10, Orange 7, Tulare 5.

Olives.

Alameda 14, Los Angeles 10, Riverside 10, San Bernardino 6, San Diego 6, Tehama 6, Tulare 6, Santa Clara 6, Sacramento 5, Sonoma 4, Ventura 4, Fresno 3, San Luis Obispo 3, Yolo 3, Yuba 3, Madera 2, Santa Barbara 2, Contra Costa, Merced, Napa, Orange, Placer, Shasta, Stanislaus, 1 each.

Oranges.

San Bernardino 31 per cent, Los Angeles 26, Riverside 14, Tulare 13, Orange 10, Ventura 2.

Peaches.

Fresno 25 per cent, Kings 7, Placer 7, Tulare 7, San Joaquin 6, Stanislaus 6, Santa Clara 5, Sutter 5, San Bernardino 5, Los Angeles 4, Butte 3, Riverside 3, Siskiyou 3, Tehama 2, Yolo 2, Kern, Madera, Sacramento, Sonoma, 1 each.

Pears.

Sacramento 20 per cent, Placer 12, Santa Clara 8, Solano 8, Lake 7, Contra Costa 6, Sonoma 6, Yolo 6, Eldorado 3, Napa 3, San Joaquin 3, Yuba 3, Alameda 2, Los Angeles 2, Nevada 2, Butte, Kern, Mendocino, Riverside, San Benito, Santa Cruz, Stanislaus, Sutter, Tehama, 1 each.

Plums.

Placer 39 per cent, Santa Barbara 18, Solano 16, Sacramento 8, Yolo 4, Los Angeles 3, San Joaquin 2, Tulare 2, Alameda, Eldorado, Fresno, Napa, Nevada, Sonoma, Sutter, Yuba, 1 each.

Prunes.

Santa Clara 47 per cent, Sonoma 13, Tulare 7, Solano 4, Napa 5, Butte 3, Colusa 3, Kings 2, Sutter 2, Yolo 2, Alameda, Contra Costa, Fresno, Glenn, Kern, Lake, Sacramento, San Benito, San Luis Obispo, Shasta, Tehama, 1 each.

Walnuts.

Orange 36 per cent, Los Angeles 30, Ventura 18, Santa Barbara 10, Riverside, San Bernardino, San Joaquin, San Luis Obispo, Santa Clara, Sonoma, 1 each.

BOYS!

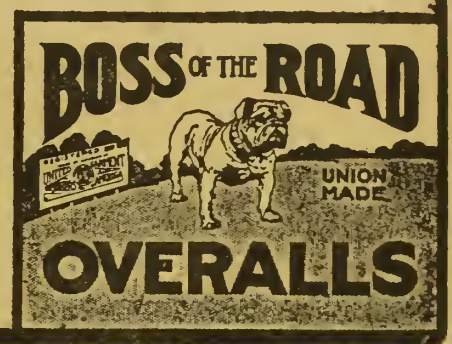
Here's a regular, bang-up, man-fashioned overall that takes to rough play like a duck to water. Easy-breezy, loose-cut overalls that stand for rough treatment—and, like Oliver Twist, come back for more.

Tell mother to get you Boss of the Road Overalls—the kind dad wears. Tell her we make 'em of the toughest, fast-color denim; double-stitched, can't-rip seams; hold-fast, patent buttons; roomy, *swinging pockets;* reinforced at all points where lively youngsters' clothes first show trouble.

San Francisco NEUSTADTER BROS. Portland

Buy them from your local dealer—he will gladly show you what we mean by swinging pockets.

Look for the Bull Dog on the label. It is your protection. Never has this trade mark meant so much to you as it does today.



The Choice of Those Who Know

Manufacturers and leading motor car distributors *recommend* ZEROLENE. The majority of motorists use ZEROLENE. ZEROLENE reduces wear and gives more power because it keeps its lubricating body at cylinder heat. Gives less carbon because, being refined from selected California asphalt-base crude, it burns clean and goes out with exhaust.

ZEROLENE is the correct oil for *all types* of automobile engines. It is the correct oil for your automobile. Get our lubrication chart showing the correct consistency for your car.

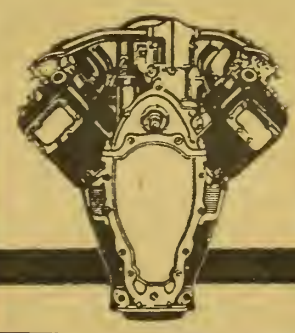
At dealers everywhere and Standard Oil Service Stations.

STANDARD OIL COMPANY
(California)

ZEROLENE
The Standard Oil for Motor Cars

Correct Lubrication for the "V"-Type Engine

This, the "V"-Type of automobile engine, like all internal combustion engines, requires an oil that holds its lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. Zerolene fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude.*



LARGEST STOCK IN AMERICA

PLAN NOW

TO ATTEND THE

Mammoth Third Annual Tractor Demonstration

WHITTIER BOULEVARD

One-Half Mile East of Los Angeles City Limits

On September 17 will open the biggest and most comprehensive outdoor demonstration and exhibition of modern farming devices and machines ever held in America.

Thousands of dollars are being expended by the Los Angeles Traction Engine and Implement Dealers' Association to make this gigantic demonstration of compelling interest to every farmer and prospective food grower in the Southwest.

As surely as Food will win the war, Victory lies in the wake of the Tractor. The importance of the Tractor cannot be overestimated. It is the Farmer's heavy artillery. Learn of the Tractor's immense value at this crucial time.

Make plans NOW to arrange your work so as to attend on these dates—September 17, 18, 19, 20 and 21. You'll be well repaid by the valuable first-hand knowledge gained.

WHAT YOU'LL SEE
AT THIS GREAT EDUCATIONAL EXHIBITION

Over 40 Kinds of Tractors in Action—Every Type of Farming Implement—New Stunts—Distinct Tests—Different Exhibition Events Each Day — Special Entertaining Features

Exhibits by leading tractor, implement, motor, automobile, oil, accessory and electrical distributors.

No Admission Charges Free Auto Parking Service
Accommodations for Over 40,000 Visitors Daily

Traction Engine and Implement Dealers Association of Southern California

Injecting Cyanide in Trees

REGARDING "Plugging Trees" touched upon on page 82 of last week's issue, in which we referred to experiments conducted in 1914, account of which was given in the California Cultivator of October 9, 1914, we made comment in effect that the process had never been successful. Our attention is now called to a report made by Prof. H. J. Quayle of the citrus experiment station at Riverside, outline of which is given in the Citrograph of July, 1916. Prof. Quayle and others of the citrus experiment station made a very thorough-going investigation and from the outline of the experiments made we quote:

"A year or so ago considerable interest was manifest in the injection of cyanide into citrus trees for the purpose of killing scales thereon. This idea started or was revived, by an article in 'Science' by Professor Fernando Sanford of Stanford University, in which it was claimed that the cottony cushion scale was successfully killed on broom and also that cyanide injected into a peach and an orange tree resulted in no ill effect on the trees. Several growers of the citrus belt inquired of the experiment station at Riverside regarding this method as a means of killing scales on citrus. Without definite knowledge, it was stated that such a method would appear to be dangerous to the tree and ineffective on the scales, but without actual trial final judgment was not justified. For this reason the entomological department of the experiment station undertook tests along this line. The detailed account of the various experiments will not be discussed here. The method of procedure was to suspend cyanide in solution five or six feet from the ground, the cyanide being conducted through rubber tubing into a hole in the trunk about a foot from the ground. Cyanide crystals were also put in the hole. This was the method followed in the experiments by Professor Sanford. It was found that citrus trees readily absorb considerable quantities of the cyanide solution, one tree taking up about five gallons of solution containing six ounces of sodium cyanide in ten days. A pomelo tree six or seven years old absorbed three gallons of solution containing seven ounces of cyanide in 12 days. With a more concentrated solution, another tree absorbed five gallons containing 25 ounces sodium cyanide.

"The solutions indicated above were more concentrated and were taken up in larger amounts than was probably necessary, but this series of experiments was conducted to determine the possibility of killing the scale, without considering the effect on the tree. In all cases the trees suffered very severely, a part or all of the tree being killed. The scales apparently were not affected until that part of the tree began to die or show the effects of the injection. With less concentrated solution or where a less amount was used, results were not so serious, but in practically all cases, even with the smallest amounts used, there was evidence of injury to the tree. Even though the scales were killed this would not prove a practicable remedy as the solution in many cases is taken up on one side of the tree only, usually the side in which the injection is made. In such cases the remainder of the tree would harbor the scales as if no treatment had been made.

"The trees treated with cyanide solution were cut down and cross sections made of the trunk and branches, and in this way the movement of cyanide in the tree was determined.

"If the cyanide actually penetrates to the very tips of the twigs, which was the case in most of the experiments as shown by the effects on foliage and branches, the question arose as to the possibility of the solution being taken into the fruit. Fruit dropped from several of the trees under experiment after the treatment had proceeded a day or two. One of the fruits was partly eaten, the person sampling it experienced the effects of cyanide poisoning and it was necessary to call a physician. These fruits were later analyzed by Mr. Young, chemist at the Whittier station, who found cyanide, in many cases amounting to as much as 1-10 mg. per fruit.

"Therefore, from these experiments, only a few of which are but briefly mentioned above, the conclusion was reached that cyanide injection in citrus for the purpose of scale control is not only impracticable but is a dangerous procedure, both from the standpoint of injury to the tree and the possibility of poisoning those eating fruit from such treated trees."

Food Administration Rules on Raisin Buying

No licensee is permitted to pay a grower directly or indirectly prices in excess of those recommended by the food administration, which are the maximum prices. Any prices in excess of those published as maximum prices will be considered unreasonable under the Food Control Act.

Raise Some Prices

As packers will not be permitted to take an excess profit on licensed dried fruits which were purchased by them on term contract or other contracts, the price of which is lower than the maximum prices established, the food administration expects packers who have such contracts to raise the price to the maximum price established by the food administration.

Purchases made from growers must be either f. o. b. cars at the railway station, or delivered by the grower at the buyers' warehouse, and buyer shall not haul, nor directly or indirectly pay the cartage nor make allowance for delivery.

That no advance shall be made to the grower prior to the delivery without same being evidenced by a promissory note bearing the prevailing rate of interest.

Sacks shall be furnished according to the custom prevailing in previous years.

Independent packers may purchase dried fruits on term contracts provided definite prices are not named and intent is merely to secure crop, or portion thereof; provided also that such term contract includes the provision that they are subject to the rules and regulations of the food administration.

Rules for Layers

In order to insure a supply of layer raisins a bonus may be paid, provided such premium is paid on the amount of layers actually packed out of the goods purchased.

This premium shall not exceed $5 per ton where the goods are delivered "tray slipped" and $15 a ton for those hand sorted. The circular further stipulates that any packer making a profit exceeding 4 per cent will lose his license. Packers selling at maximum prices will have to justify these prices to the administration.

Test Value of Bordeaux Mixture

AS a result of the present high price of copper sulphate, the principal active ingredient in Bordeaux mixture, many farmers who are compelled to combat such diseases as late-blight of potato, black-rot of grape, and bitter-rot and blotch of apple are asking the United States department of agriculture, "What can we use as a substitute for Bordeaux mixture?" There is no substitute, according to specialists of the department—Bordeaux mixture is the only reliable preventive for such diseases. Methods of calculating the value of commercial Bordeaux mixtures have, therefore, been published in Farmers' Bulletin 994, a copy of which can be obtained from the department at Washington.

Every package of commercial Bordeaux mixture carries a label on which is given its content of copper. This is usually given in percentage, and by multiplying this percentage by 3.93 the result gives the amount of crystallized copper-sulphate, the bulletin explains. If the percentage is given in terms of copper oxid, multiply by 3.14; if in copper hydroxide, multiply by 2.56. In order to calculate the copper sulphate when diluted ready for application, multiply the number of pounds of the concentrated Bordeaux mixture to be added to 50 gallons of water by the percentage of copper sulphate.

Physical properties, such as adhesiveness, texture, spreading quality, and rate of settling, also are important factors in determining the efficiency of Bordeaux mixtures. A preparation containing a large amount of copper, but coarse and granular in texture, with poor spreading and sticking qualities, can not be expected to give good results in cases where a good fungicide is required. To test the physical properties, dilute the mixture and place a small quantity in a glass tube, and watch the speed with which the solids settle to the bottom. If the copper is held in suspension for a great length of time the physical properties of the mixture may be regarded as good.

In order to reduce the cost of spray material some growers are using a weaker mixture than is commonly advised for the various diseases which require Bordeaux treatment. When the disease attacks are mild, a Bordeaux mixture containing considerably less copper sulphate than is commonly advised may give very good control, provided its physical properties are good and it is thoroughly applied, the bulletin states. When infection is severe, weak mixtures should be avoided, for the resultant loss when they are used may much more than offset the amount saved by using the proper strength. Spraying is a question of insurance and the grower must decide whether he wishes to insure his crop wholly or only partially by the use of Bordeaux mixture containing sufficient copper.

Mismarking of Fruit

The following is an excerpt from a letter from A. Wellner, president of the Buyers' Association of New York, to Chas. Virden, general manager of the California Fruit Distributors:

"We take this manner of calling your attention to an abuse which is practiced by many growers of your state. A habit of placing large fruit on the top of carriers and inferior and small fruits on the bottom seems to have been encouraged through the fact that no one takes the trouble to point out who these so called deceivers are. On this day we had in the offering several packs of apricots marked as five by five packages and the bottom row contained fruit about the size of a nine row cherry. This abuse brings us into a great deal of difficulty with the consumer who often returns this fruit and makes it appear as though the deception is on our part and done with intent to defraud. We have had a number of complaints of this nature through the season."

From the above it would seem that there has been some flagrant mismarking of certain fruit and that the inspectors will have to enforce the provisions of the standardization act with a more rigorous hand. There is little excuse for conditions such as are outlined above and if this state is to stand behind its products the producers must be prepared to abide by its regulations.

That this complaint of sharp practice on the part of certain shippers is not merely a trick of the Buyers' Association is evidenced by a letter received by this office from the bureau of chemistry, United States department of agriculture:

"The federal food and drugs act states that food in package form shall be misbranded if the quantity of the contents be not plainly and conspicuously marked on the outside of the package in the terms of weight, measure or numerical count.

"This provision of the law is applicable to products of the farm such as fruit and vegetables if shipped in package form as well as to manufactured foods. Shippers of these products should see that bags, crates, boxes, hampers and packages of other kinds bear a true label before being shipped in interstate commerce or otherwise brought within the jurisdiction of the act.

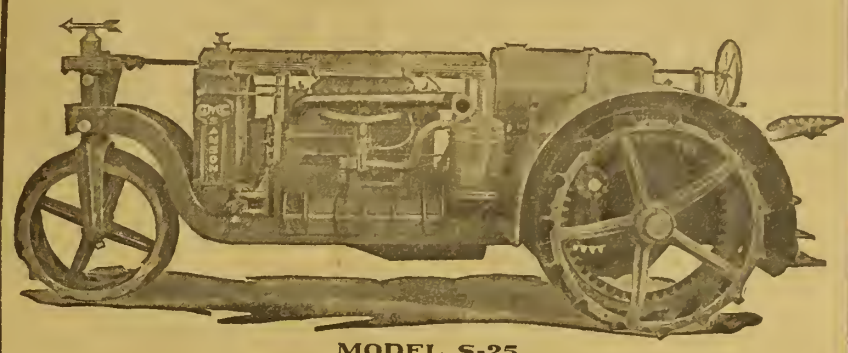
"If during the present season inspectors of the bureau encounter interstate shipments of these products not properly marked with a statement of net contents, official samples will be collected and appropriate action taken under the terms of the food and drugs act." — Report of State Horticultural Commissioner.

GRAPE INSPECTION IN FRESNO COUNTY

County Horticultural Commissioner Roullard of Fresno writes encouragingly regarding the work of standardization and this season's shipping. He says:

"We are in the midst of the grape harvest. I will probably have 11 inspectors in the field during the height of the season. Grapes are a little earlier than usual and are extremely high colored. Slight traces of mildew have been encountered by the inspectors. There is a tendency among the growers to want to ship their grapes too soon, which has caused a number of condemnations on account of too early picking. Mr. Bremner has been put in charge of grape inspection in Fresno and Tulare Counties. This has been a very satisfactory arrangement for both counties and the work is progressing nicely."

Allies in the Fight



MODEL S-25

SAMSON SIEVE-GRIP TRACTORS

GMC TRACTORS GMC TRACTORS

The "Sammies" at the front and the "Samsons" on the farm have proven their effectiveness. Both have been tried and found not wanting. Both are doing their parts successfully in their respective fields of effort. They are the result of careful selection approved by rigid tests.

In the "Sammie" is crystallized all the dominant features of the ideal soldier. In like measure, we believe that you will find embodied in the GMC Samson Sieve-Grip Tractor all the features of the ideal tractor,—simplicity, strength and endurance, coupled with economy in operation and ability to meet the most exacting demands day after day, fair weather or foul.

The GMC Samson Sieve-Grip Tractor stands on a sure foundation,—a record of nearly two decades of service.

It displaces ten horses on the farm and is adapted to countless uses, stationary and otherwise, for many of which horses are not suitable. All these labors it performs quicker, cheaper and better than any other power.

The strength of its working parts and its dust-proof motor assure long life and low up-keep costs. By reason of its simplicity, no skilled mechanic is required for its successful operation. Its steering device makes operation easy for the driver, without strain on the machine. Its lubricated Roller Pinions deliver maximum power to the drawbar with least friction loss.

Let us send you our latest booklet, "Better Farming."

MARTIN!

KING OF DITCHERDOM

Built for farm use. Equally successful for drainage or irrigation ditches. Fine for terracing and levee work. Cuts the toughest alfalfa or sweet clover roots without plowing. Leaves the ditch with smooth, hard banks. Works in any soil.

IT DOES THE BUSINESS

10 DAYS TRIAL

The name **Martin** on a ditcher is an assurance of satisfactory field work. It is significant that most Martins now go where others Martins blazed the trail. Each machine sells another—and the reason is

All Steel Reversible-Adjustable
No wheels, cogs or levers. Made in 2, 4 and 6 horse sizes. Large size fine for tractor use.

Popularity and True Merit

The Martin always has been and always will be sold **on its merits** and under a guarantee of satisfaction. More **Martins** are now in use than all other farm ditchers combined, and the facts stated in this advertisement tell why.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Potatoes as Goat Feed

Do you consider boiled potatoes a good substitute for rolled barley in the feed of milch goats, especially in the winter before freshening? My goats will not eat raw potatoes but eat boiled ones with avidity.—Subscriber, San Luis Obispo.

Potatoes may be fed extensively to live stock, especially if cooked. However, Henry's "Feeds and Feeding" says: Heavy allowance of potatoes produces milk and butter of poor flavor. According to Pott, cows of average weight should not be fed more than 33 pounds per head daily of cooked potatoes and somewhat less of the raw tubers." "In Europe heavy yielding varieties of large sized potatoes are extensively grown for stock." "Heavy feeding of raw potatoes is not advisable, as it induces scouring." "If fed in limited amounts slice and mix with dry feed." Do not feed sprouts nor unripe potatoes to stock. In some European countries dried potatoes are fed extensively to live stock.

For a milch goat we have no data, but if 33 pounds is the limit to a milch cow then the quantity to be allowed to a milch goat should not exceed four or five pounds when in milk. Before freshening the feeding could be more liberal. The water in which the potatoes are cooked should not be used. We will be glad to hear from any goat breeder who has experimented in feeding potatoes.

Horseradish Roots

In regard to question and answer about horseradish roots on page 35 of the Cultivator of July 13:

Horseradish roots are only good at one season of the year, and that is just before the plant starts up in the spring. Then the roots are tender and juicy and have the taste that we all like on a piece of good bacon. The roots should be dug then and stored away as you would potatoes. Wash them and trim them and pack in a barrel in the cellar where they will not dry out. It will only keep then for a reasonable length of time. To keep it for later use it should be grated and bottled with vinegar the same as that you can buy in the market. After the plant has put forth its leaves the roots become woody and tasteless but become tender and pungent again after a season of rest in the winter.

Castor Bean Market

Where could I find a market for castor beans?—Subscriber, Azusa.

We are not certain as to where a contract may be secured other than that the war department has made contracts with certain people in this state for growing some 10,000 or more acres of castor beans this year. Whether the contractors are in a position to buy any stock outside that actually contracted for we are not certain. The contract price was, we believe, $3.50 for 46 pound bushel and from this the contractor was allowed to deduct ten per cent. Information may be had by writing Henry S. Gane, Santa Barbara.

Blossom End Rot

Have some fine tomato plants but as fast as they ripen a black rot as large as a half dollar takes possession of the flower end. Am getting about one out of six. As every one else in this section is having the same experience and we are in line to lose the greater part of our crop, can you give us a remedy in the next issue of the paper?—Subscriber, Elsinore.

Blossom end rot is one of the worst pests that bothers the grower of tomatoes. It is a bacterial disease, though various fungi seem to develop once it becomes apparent. "The Culture of Tomatoes in California with Special Reference to Their Diseases," by Prof. Rogers, treats upon it quite fully, and the only control or preventive measure suggested is: "Keep the plants growing steadily. Irrigate at regular intervals, putting on a sufficient amount each time to allow the water to reach the feeding roots. Cultivate thoroughly after each irrigation." This bulletin may be secured by writing University of California Agricultural Experiment Station, Berkeley, and asking for Bulletin 239.

Government Prices

Would like to know as to government prices. Has there been a price set on raisins? We have sun dried Sultanas and Thompson Seedless. We have been told that the government set a price of 6¼ to 6¾, sweat box delivery.—Subscriber, Ontario.

The market page of this week's Cultivator contains the prices which have been made by the Associated Raisin Company. The government has directly named no prices, though the food administration has approved the action of the Associated which practically amounts to naming the maximum price. No minimum price has been named and the securing of the maximum or as high a price as possible is up to the business ability of the grower unless he is a member of the Association.

Sale of Lemons

I sold my crop of lemons on the trees and got $150 in advance. A little later the same man purchased the grove and now he claims that he pays for the fruit twice and wants the money back. As nothing was mentioned in the contract about it I think I have a right to keep the money.—Subscriber, San Gabriel.

This question is not referred to the legal department because, plainly, it is one of fact rather than of legal procedure. As stated, it appears to us that the original owner of the place is entitled to retain the $150 and to collect the balance due when fruit is marketed. The transaction had been entirely completed before purchase of the place, and as purchaser had full knowledge of the former sale of the fruit .he could not set up any claim of innocent purchaser of the ranch with the expectation of securing control of the fruit. On the other hand, if it had been sold to a party not aware of the preceding sale of the fruit, then as purchaser of the place he would be entitled to all fruit remaining.

Year Book

I noted your review of the year book of the department of agriculture and would like to ask where should the request be sent for this district.—Subscriber, Heber.

You may write to Congressman Wm. Kettner who is representative of the 11th district, or you can write to Senators Hiram Johnson or James D. Phelan, Capitol Building, Washington, D. C.

Scum on Honey

After storing honey I note scum forms. What is the cause and how may I prevent it?—Subscriber, Los Angeles.

This question was referred to Prof. Geo. A. Coleman of the state university, who answers:

"On all honey after extracting, if allowed to stand in the vessel, a scum will rise to the top, made up of impurities such as wax, brood, dead bees or particles of dirt which may get into it. This is particularly the case with honeys which are extracted when not thoroughly ripened. In all cases honey should be strained as it leaves the extractor and subsequently skimmed until no further impurities come to the top. It is frequently the practice to draw honey from the bottom of the tank in which the honey is stored through a 'honey gate' so that the impurities do not get into the smaller receptacles in which the honey is to be packed. The thorough ripening of honey cannot be too strongly recommended. Honey attracts moisture and there is always a tendency for a very thin layer to form on the top in which the water content is very high. In such a film the amount of sugar is low, the acetic acid forming bacteria can grow rapidly and the honey becomes sour. In thoroughly ripened honey it is very probable that a film of thinner honey is always present, but in such a case the sugar content is so high that the bacteria cannot grow."

Killing Trees With Chemicals

Will you please give me information concerning the killing of pepper trees. There is one method of boring a hole in the side of the tree and injecting some solution into it but the name of the solution has been forgotten.—Subscriber, Montalvo.

We know of nothing as effective and cheap as girdling with the ax. If one wishes to experiment, however, we may say that cyanide of potassium in solution introduced so as to be absorbed by the cambium or first layer under the bark will ultimately result in the death of the tree. On this point interesting information may be had by reading Prof. H. J. Quayle's article on page 128 of this issue. Any chemical treatment is reasonably sure to cost far more than a bit of muscular work. Even in the matter of taking out stumps and preventing suckers from sprouting up there has never been very satisfactory chemical treatment. A practice which is quite common, however, is to bore holes in the top of the stump, preferably near its outer rim, into which saltpeter is placed. This especially if an attempt is to be made later in burning. After placing the saltpeter a few weeks or a month later the stump is known to be far more combustible. We would prefer this to the application of salt over the top of the stump which some often recommend. The salt is liable to prevent decay and certainly does not increase combustibility.

Sheep Running at the Nose

Some of my sheep have a running at their nostrils. Is this caused from the gad fly? Can you tell me how to cure them?—Subscriber, Ripon.

See article on Control Sheep Pests, page 41 of issue of July 13, 1918; also Dr. Petrie's reply, "Grub in Head," page 87 of issue of July 27, 1918. This is possibly a case of grub, an internal parasite which is practically impossible to handle when well established. For the other sheep, preventive measures should be followed as suggested in the articles referred to.

Cutworms in Alfalfa

Cutworms are seriously interfering with my stand of young alfalfa. How can I control them? — Subscriber, Santa Cruz.

Use a pound of Paris green to 40 pounds of bran; sweeten if possible with cheap molasses and water sufficient to make a stiff mash. This should be distributed about the field in small quantities. Of course, poultry and other stock should be kept out. And it should be distributed in such small quantities that larger stock will not be injured. To prevent further increase in the number of worms, the placing of light traps, with torch over shallow pan of oil, destroys thousands of the moth. This last measure should not be depended upon for control for thousands of the moths will have laid their eggs before they are caught.

GREAT TRACTOR EXHIBIT AT STATE FAIR

The California Tractor and Implement Association will unite in making a great exhibit at the state fair to be held at Sacramento, August 31 to September 8. The exhibit will be what is known as a still exhibit, the same as that of last year. There will be no machinery in motion inside the tents.

There will be members of the association present to explain the "Stanislaus Plan" for financing tractor purchases. There will also be practical demonstrations for encouraging tractor owners in better care and more extensive use of their machines.

MUCH WORSE

"Can you imagine," said a teacher of natural history, "anything worse than a giraffe with a sort throat?"

"Yes, sir," came the answer from one boy.

"What, pray?" asked the teacher in surprise.

"A centipede with corns."

Help Win the War by Making Food With the "New Way" Vegetable Drier

Wonderful home process for making Potato flour. Sure, safe and economical.

Any person can operate it and make big money. We show you how and will sell a few of these machines **at cost** to introduce them in California.

We set the drier up and start it working. Will dry all kinds of fruits and vegetables. Get a "New Way" Drier and become independent. Be sure to write us for our complete circular. Do it today, while you are thinking about it.

REDWOOD IS DURABLE WOOD

REDWOOD IS FIRE RESISTING

No mere words can tell a truer story of the fire-resisting quality of redwood than this picture of the scene after the fire.

PACIFIC REDWOOD tanks and pipelines are built of seasoned lumber, in the manner thirty years of experience has proved the best.

PACIFIC Redwood tanks and pipelines cost so little to install, and last so long, that there is no farm investment equal in the amount of comfort furnished.

They save labor and drudgery, they preserve life and food, they economize time, they are the final touch to farm improvement.

To make the farm more attractive install a PACIFIC redwood tank and pipeline.

Our engineers will cheerfully draw up a water system, at your request.

August Vegetable Planting in Southern California

Written for California Cultivator by D. F. Reichard

AUGUST is the second spring time for Southern California gardens. This is when we get another "swat at the kaiser." True, it takes a little more water to keep the ground in shape, but the weeds do not grow as freely as in the spring and early summer. As soon as the early crops are harvested prepare the soil for second crops. Fertilize, thoroughly irrigate and work the soil. When the ground is in shape plant your seeds or plants at once for every hour's delay means so much moisture lost. In planting seed at this season they should be planted twice as deep as in the spring when the weather is cooler because the surface soil dries out so quickly.

Plant now for fall and winter vegetables. Write to the food administration for information as to how great a help it is to the nation and the Allies and how great a benefit to our own health to use vegetables. Raising the stuff at home saves outside labor and transportation. Using vegetables grown in the neighborhood saves transportation and waste of time and labor in handling the produce through the larger distributing points. Many of our crops do much better when planted during the late summer months than at any other time of the year. Among these are beets, carrots, turnips, parsnips and kohl rabi. The cool months in which they mature give them better flavor and they keep in the ground much longer and better than spring grown stuff. Cabbage and cauliflower are really good when they head during cool weather. By starting the plants this month these will come into maturity about the first of the new year.

The first part of August is the time to plant the fall potato crop. Those put in at this time come off during cool weather and are in fine shape for keeping through the winter and spring until new potatoes are ready. It requires about 50 per cent more potatoes to plant a given piece of land to fall crop than in the spring. That means that to plant an acre to potatoes will require about 1000 pounds of seed.

Among other vegetables that may be planted with safety and profit during August are varieties of bush beans, sweet corn, cucumbers and peas as well as such hardy items as kale, lettuce, onions, parsley, Swiss chard and salsify.

Plant everything in rows to facilitate irrigating and cultivating — the garden looks much better where everything is growing in neat regularly spaced rows.

Beet, carrot, kohl rabi, lettuce, green onion, parsnip, radish, Swiss chard and turnip seed should be planted in rows 18 to 24 inches apart where they are to grow to maturity. Thin out the young plants when a few weeks old so that they can grow to their natural size without crowding. Plant peas, beans, corn and potatoes in hills where they are to grow with rows two and a half to three feet apart. Cucumbers, summer squash and melons where the climate permits should be planted in hills, allowing at least four feet apart each way.

UNITED STATES EMPLOYMENT SERVICE

Nearly all the employment agencies the country over have been turned over to federal management. This has been true of county and municipal employment places, and the federal government is now locating employment offices in many small sections. While the nucleus of a federal employment system was established ten years ago in the former department of commerce and labor and continued in a more developed form when, in 1913, the department of labor was created, the present service really dates from January, 1918.

The previous nine months had taught the necessity of a national mobilization of labor for war production—the centralization in a government agency of all war labor finding and placing. Independent and unregulated labor recruiting by the growing war industries had demoralized the labor market. War plants, sick of the situation, were forced to "steal" or "poach" in an effort to maintain production. Unscrupulous private fee employment agencies grew opulent on turnover.

Offices established by the government on the Pacific Coast have been numerous, in fact a glance at the list for the entire United States shows that California really has the greatest number of federal agencies of any of the states. Here is a list of some of the offices in Districts 12 and 13:

District 12

Arizona

Flagstaff, Courthouse; Phoenix, 14 Wall Street; Tucson, 63 West Congress Street; Yuma, 311 First Street.

California

Alturas, Anderson, Antioch, Bakersfield, Post Office Building; Berkeley, Bieber, Cedarville, Chico, Colusa, Crescent City, El Centro, Eureka, Fresno, Herald Building; Grass Valley, Hanford, Hayward, Hemet, Hollister, Hynes, King City, Los Angeles—Post Office Building, 207 South Broadway (commercial men's and women's division), 260 Franklin Street (men's industrial division); Loyalton, Madera, Marysville, Merced, Modesto, 804 Ninth Street; Napa, Newcastle, Oakland, 410 Tenth Street; Oxnard, Placerville, Porterville, Red Bluff, Redding, Sacramento, 915 Second Street; Salinas, San Bernardino, San Diego, Post Office Building; San Francisco, 2 Appraisers' Building, 115 Chronicle Building (women); San Jose, 176 South Market Street; San Luis Obispo, Santa Ana, Santa Barbara, Santa Maria, Santa Rosa, Sebastopol, Stockton, 200 South San Joaquin Street; Susanville, Tehama, Vacaville, Visalia, Watsonville, Willows, Winters, Yreka.

Idaho

Boise, 303 North Eighth Street; Pocatello, 348 West Clark Street; St. Anthony, Court House; Twin Falls, 6 Bough Building.

Oregon

Eugene, Pendleton, Medford, Portland, 247 Davis Street, City Hall (women); Salem.

Washington

Aberdeen, Bellingham, Postoffice Building; Everett, Seattle, First Avenue and Cherry Street; Spokane, Postoffice Building; Tacoma, 114 Tenth Street; Walla Walla, Postoffice Building; Wenatchee, Yakima, 118 East A Street.

Hawaii

Honolulu.

"but be sure you get Pioneer Roofing"

It's cheaper to keep your buildings, silos and sheds in good repair—than to build new ones. The roof is a very important part of the building. Don't neglect it. Select materials that are known for their reliability.

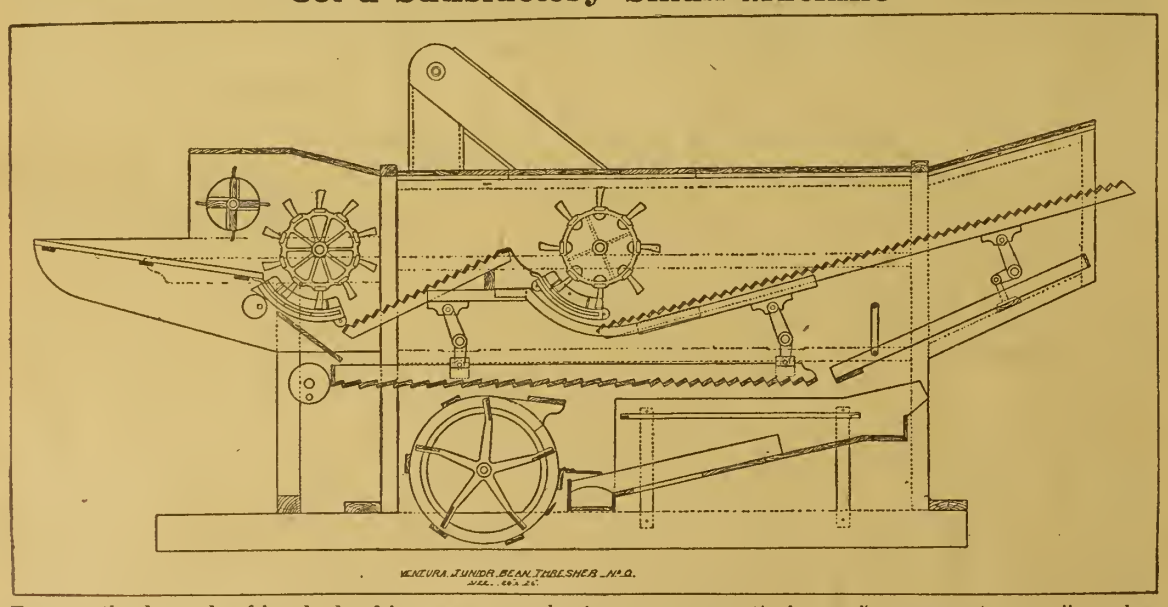
Two Men Can Thresh Beans With This

Don't Risk the Loss of a Valuable Bean Crop by Rain When You Can Get a Satisfactory Small Machine



To meet the demands of hundreds of bean growers who have a comparatively small acreage, too small, perhaps, to obtain the services of threshing outfits employing 40 or more men, we offer the Ventura Junior No. O Bean Thresher, a thoroughly practical and satisfactory small machine that can be operated by only two men. It is made on the same principles as our larger machines that have given satisfaction in California for the past 22 years and will thresh every variety of beans. Can be operated by tractor or gas engine and easily loaded and moved from place to place.

It is sold mounted or unmounted and with or without gas engine. This thresher is equipped with cylinder teeth as found by experience to be far superior to machines made elsewhere equipped with round iron pegs for teeth. The cylinder teeth in the Junior O can also be equipped with clips,—special Ventura devices for quick accurate adjustments.

We make six sizes of bean threshers. Write us regarding bean threshing machinery, stating what acreage and power you have and in what capacity machine you would be interested.

Our manufacturing facilities here are such that we offer our customers superior service as compared to service from the east necessitating long freight hauls on heavily loaded roads. If you want a bean thresher it would be prudent to order early and order where you know delivery can be made and where parts can be obtained on short notice.

Tropical Fruits

Written for California Cultivator by Ernest Braunton

THIS is the day of tropical and sub-tropical fruits in California. Never have so many been planted in orchard and garden as during the last two or three years. Every sort of fruit is being given a try-out and every country of similar climate is being searched for fruits for California and Florida.

It must not be expected that all may be grown here, even though frosts may not destroy. Neither will our soils and climate suit all that are sufficiently hardy. Some fruits that will endure much cold will need a more humid atmosphere in which to develop fruit that is palatable. And not all tropical fruits are attractive, even in their native home. I have talked with many travelers in the tropics and have yet to find one who considers the Mammee Apple (Mammea Americana) as attractive to anyone not exceedingly hungry. Last week I talked with a man, not a horticulturist or having any special knowledge of plant life, who has been in the Philippines, China, Japan and four times in Cuba and other West Indian islands. He states that the Mammee tree is fine for shade and general appearance, but the fruit is never eaten raw when anything else is obtainable and is but little better when cooked and sugar and flavoring added. It is plain no Mammee apples should be grown here except as curiosities, though in our warmer sections the tree will doubtless prove attractive as an ornamental.

Indian Lotus

Why do not more grow Indian lotus in their gardens? Nothing could be easier. A constant water supply or a home in thin mud of considerable strength is all that is necessary. In a swamp in Bordentown, New Jersey, the plants have become naturalized, having been planted there more than forty years ago by E. D. Sturtevant, for long years now a resident of Los Angeles. This lot is noted in aquatic literature (in a dry state) as the only place in the United States where the lotus has become naturalized or "run wild." These plants are by many called Egyptian lotus, but they are not native to Egypt, do not grow along the Nile River, and the so-called lotus of the ancient Egyptians was a nymphea or what we call a water lily. Aside from the oriental species but one other is known, and that one is native to the United States. It has the further distinction of being the only yellow one on the globe. It is not known that the two species will hybridize. Roots planted in shallow water at edges of ponds will thrive in any part of California. They are gross feeders, and cultivators use much stable manure in soil prepared for them. Under fairly good treatment they yield an abundant crop of very large flowers of many shades of color, during early summer. One does not need to build an artificial pond for them if he has a marshy depression on his land.

Return of Cacti

It is now a full quarter century since the collapse of the last "kactus kraze," in which the writer had no small part, having had charge of the largest commercial cactus stock ever assembled. At various times a slight renewal of interest has been apparent and is now more apparent than at any time during late years. I fully believe that when the great war is over and the normal in all things is resumed, there will be a revival of interest in cacti, but it will never again become so strong a "fad" as it was twenty-five to thirty years ago. No family of plants has more beautiful flowers; no family has so many curious and interesting forms. All persons show a kindly regard for cacti in general, for none "handle them without gloves," and few but treat them tenderly, if not affectionately.

Climbing Ferns

It is known to many that climbing ferns exist, but to a far lesser number, perhaps, that they are exceedingly easy to grow. They will grow where the climbing asparagus grows and do equally well under similar treatment. Twenty years ago the strings of these ferns could be had at any local florist's shop; now they are not much seen. They are neat and attractive climbers for shady spots and should be more popular. All are species of Lygodium and may be ordered under that name. The more common species is L. Japonicum, though dealers may call it L. scandens, a less-known species. Both are easily grown in any garden.

Monkey-pot or Paradise Nut

Occasionally there is seen on local markets a nut under the name of Paradise nut, commanding a higher price than the Brazil nuts so comon everywhere, and of a more delicate, pleasing flavor. They are species of Lecythis, members of the Myrtle family, trees native to the same parts of South America as are the Bertholletias, or Brazil nuts. It is too cold in California for any of these trees to make a successful permanent growth.

Philippine Nut

This nut is native to Luzon and other islands both within and without the Philippine group and is known to botanists as Canarium Luzonicum. These nuts are not very popular in California and many who buy them once are satisfied for all time. Fresh nuts, from specific trees, are doubtless very good, but there is a great range in flavor and as a whole the crops reaching California are not popular. The trees are from the tropics only and cannot be grown in California.

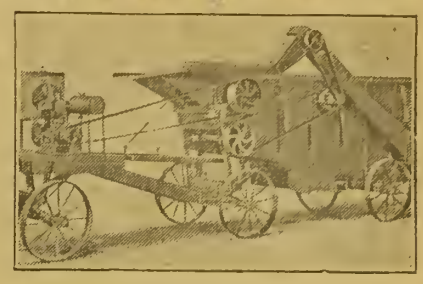
Australian Tree Asters

When Prof. L. H. Bailey returned from New Zealand, a couple of years ago, he wrote me that he marveled we did not grow more oleasters or tree-asters from Australia and New Zealand. As their popular name implies, the flowers much resembel asters but are borne on shrubs and small trees. They are very floriferous, hardy here, and should prove valuable additions to our long list of fine plants from the Antipodes. They have been tried in California and not found wanting. In the northern part of the state they are more planted than in the less humid south.

Evening Primroses

Oenotheras or Evening Primroses are by no means confined to the yellow species that is wild in our lowlands. Other species are of white and several shades of pink, of large size, good color, easy of culture, and altogether much to be commended for general culture in flower gardens. I have grown all these sorts and have seen them in the gardens of others, so have no hesitancy in recommending them to others. In fact, some species are of such easy growth that they are self-sowing and come up each year after once planted in a favorable spot.

Cushman Light Weight Motors



FOR
Bean Threshers
Ensilage Cutters
Corn and Grain Binders
Shellers and Hay Presses

Combined Harvesters, Potato Diggers, Rice Binders, and all other farm work.

4 to 20 H. P. Weigh only about one-fourth as much as ordinary engines, yet run even more steadily and quietly.

Moving parts run in oil, absolutely enclosed; free from dust.

Equipped with Throttling Governor, Carburetor and Friction Clutch Pulley. Cooled by circulating water system, driven by engine pump.

Thousands are in use in this state, doing more different kinds of work than any other type of engine. Sold by California Representatives and distributed from stock in California Warehouses. Write for Book on Light Weight Engines.

Farm for Profit

and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

Percheron Breeding in California

By R. P. Royce

CALIFORNIA breeders made a splendid record in 1917 in Percheron breeding according to recent information sent out by the Percheron Society of America. Our Percheron men registered 76 colts during the fiscal year ending October 31, 1917. This makes California stand 20th in the United States in Percheron breeding. The ten leading states in the order of their importance, together with the number of colts recorded from each, follows: Illinois 2386, Iowa 2110, Ohio 864, Kansas 759, Nebraska 523, Minnesota 447, Indiana 440, South Dakota 392, North Dakota 370, and Wisconsin 353.

The horse business is on its way to better times. Percherons have been increasing in popularity rapidly during the past 12 months. The Percheron Society of America reports that "During the fiscal year ending October 31, 1917, 10,508 Percherons were registered in our society—over 1000 more American bred colts than were ever recorded before in one year. Over 11,000 horses were transferred on the records of the society in the time mentioned. In spite of expensive feeds and a scarcity of farm help the Percheron horse has had a greater year's business in 1917 than ever before."

California breeders who recorded colts last year, together with the number of colts they registered: J. A. Franklin, Durham, 2; Friesleben Estate Company, Oroville, 1; J. T. Silva, Pinole, 2; T. G. Atkinson, Metropolitan, 1; Ramina Ranch, Tehachapi, 1; M. Bassett, Hanford, 2; W. D. Trewhitt, Hanford, 2; L. E. De Forest, Susanville, 2; Dodge Brothers, Red Rock, 2; A. O. Dinsmoor, El Monte, 2; Elliott-Brant Rancho, Owensmouth, 3; Ed R. Maier, Los Angeles, 2; A. H. Tilton, Madera, 1; H. H. Van Nader, Ukiah, 1; C. L. Crawford, Ukiah, 2; J. C. Johnson, Ukiah, 1; J. L. Harvey, Adin, 3; T. M. Harvey, Adin, 2; F. L. Hall, Perris, 1; Frances A. Read, Blythe, 1; George J. Read, Blythe, 1; A. J. Stalder, Riverside, 7; Paicines Ranch Company, Paicines, 3; George A. Pope, San Francisco, 1; Ralph L. Clark, Lodi, 2; Mrs. F. S. Israel, Linden, 4; H. G. Learned, Stockton, 1; Edmund Miller, Stockton, 1; I. C. Richey, Ripon, 1; Cora S. Secrest, Stockton, 5; John Secrest, Stockton, 1; Robert Blanch, San Jose, 1; Oliver P. Jenkins, Stanford University, 10; Shavista Ranch, McArthur, 1; Lillie E. Gurnsey, Red Bluff, 2; Walter Reed, Los Molinos, 1.

The demand for draft horses on our farms is increasing. Argument to convince an intelligent farmer of the advantage of using heavy horses is no longer needed. He knows it. Farm sales reflect the situation. Roomy, drafty mares—grades—standing from 16 to 16.2 hands, and weighing 1600 pounds or over, will, if of reasonable age, command $500 to $600 per pair in almost any farm sale, and there are never enough of this sort to satisfy the clamorous demands of hard-headed farmers who want good teams. Small stuff and animals of draft breeding but too young to work may sell at a discount, but draft animals of serviceable ages are keenly sought after by farmers in all sections of this country. For a time last fall they sold below their real value, on account of the attempts of many owners to cut down on feed bills during the winter, in the hope that they might thereby be able to buy at a figure this spring which would make the venture profitable, but prices on good draft mares have advanced fully $50 per head in the last few months, and men who have sold themselves short are destined to pay dearly for their experience when they find it necessary to buy.

Apparently a great many ranchers who use horse power to a greater or less extent figure that they can buy horses and mules cheaper than they can raise them. That such a policy is a grave mistake must be evident to anyone who will stop and consider where such a policy will end.

Suppose for the moment that the majority of ranchers adopt the plan of not breeding their big mares, thinking that when the time comes to buy they will have no trouble buying what they want from their neighbors. Clearly, the farmer cannot buy a horse unless some other farmer bred his mare four or five years before. Normally the bulk of our best draft horses has been produced by a comparatively few breeders, and if these breeders fail to breed their mares it does not require a prophet to see what is bound to happen. A shortage of desirable horses is inevitable, and prices will increase under competition.

That the horse and mule industry is headed in this direction goes without saying—it is a matter of common observation that the number of mares being bred is showing a heavy decrease each year. It is too early to note a keen shortage yet, but it should be borne in mind that a horse shortage does not manifest itself for about four or five years. Those who have given the question thought are certain that a marked shortage will be a fact within five years.

If the facts are as stated, the future course of the keen horseman should be plain—prepare now for the shortage.

City and farm demand will continue to furnish an outlet for serviceable stock of the right stamp, and the war—and before long peace in Europe—will require vast numbers. European demands and domestic demands will be factors that will set new value on horses and mules.

The man who views the future closely and acts with foresight will find that producing horses will be profitable.

MAKING HERDSMEN

The unusual condition caused by the number of young men going to war has placed the responsibility of feeding and herd management in many cases in inexperienced hands, and as a result many capable and expert fitters will be developed. It will require a little time and a little careful study, but the expertness will come.

Nobody has a corner on expertness. There have been many illustrations of the untried farm boy bringing out animals well conditioned and in attractive bloom. There will be many more of these illustrations in the near future. There are many opportunities for the boy who has a little capacity along this line. The improved stock industry is constantly in need of more fitters who are capable. There is an attractive field awaiting.

Field Notes from the Live Stock Men

Maurice Rucker's Trailblazer, sired by the great Pathfinder, is a splendid animal, with about all the strong points of the Duroc-Jersey. He is in the running.

Professor Thompson says that the Hampshire hog is coming into greater notice and favor in the East and will be making a greater showing in this state in the not distant future. It's a good hog at that.

H. L. and E. H. Murphy are filling their big silo with the best possible material, sweet corn. Their fine sleek Shorthorn herd and well fed Berkshires show excellent care and should show up well at the state fair August 31-September 7.

Milking Shorthorns and Berkshires on the farm of Geo. A. Murphy form two of the main sources of income. A visit to see them always gives a breeder pleasure, and George always gives a fellow some valuable hints on good breeding practice too.

Dr. H. W. Hand's "Keep One" herd of Jerseys will soon have nine head on official test in a hot race for Register of Merit honors. He expects a fine record from his junior champion cow, "Brilliant Jersey Queen, which has just freshened.

W. M. Carruthers says he is going to show at the state fair a herd of Shorthorns of the best quality that has ever entered a show ring on the Pacific Coast. He's a man who usually backs up words with deeds so look out for his showing.

H. P. Slocum & Son's showing on the fair circuit this year will be a strong presentation of the merits of the Duroc-Jersey. Many think that contestants will have difficulty in winning much of the "sky blue" from his excellent herd headed by his splendid boar. They are good to look at and the judge is going to notice 'em.

C. A. Briggs writes: "I have a Jersey heifer calf that I think is a likely chance and I plan to enter it just to see what the judge will say about it. She was born June 16. Her sire was Majestic Noble Lord and her dam Beatrice of Venadera, a Register of Merit cow with a record of 532.02 pounds of butter, 7834.1 pounds milk; she carried a calf 201 days during the test.

Lovers of good swine will all regret the news of the death of Fred Johnson's great Duroc-Jersey boar, Johnson's Defender that won junior and reserve championships at the last state fair. A sketch of him appeared in the Cultivator a short time ago in our Breed Leaders department. The picture published in that article gives a good idea of this great sire who would have added to his laurels had he lived.

A. J. Morey and his partner-wife, Nellie A. Morey, have 16 head of registered young Jerseys. Their Gertie's Fox Alene came fresh September 20, 1917. She won for her owners $46 and grand championship at the Orland fair last year, and also a prize of $40 for highest product. Her bull calf sold for $100. Up to June 1918 she has produced 400 pounds of butter fat at an average price of 45 cents with her skim milk valued at $15, a total income for nine months of $281.

Everybody is feeling good all over to have Professor J. H. Thompson back in his place at the University Farm, Davis. In a long talk with him the other day he said that he was receiving many inquiries for pure bred swine of all breeds from all over the state. The demand is strong for bred sows, which promises well for the state's output of pork for 1919. This is a splendid indication of a determination of the Golden State farmers to produce the food that will surely win the war. The largest food reserve will surely do it.

ARO HOLSTEIN SALE

On Tuesday, August 20, at the Aro Holstein Farm Dispersion Sale, will be sold one of the greatest young sires ever offered on the Pacific Coast, together with seven of his young daughters. Colantha Aaggie Sir Johanna as an individual would be hard to fault. He is royally bred, being a double grandson of the famous "Century" sire, Colantha Johanna Lad, whose daughters have made remarkable official and semi-official records, he being one of the three only sires each having at least 19 30 pound daughters, and three of his semi-officially tested daughters held world's records in that division at one time.

The sire is a bull of unusual merit, as is shown by the splendid records made by his daughters. He is by Colantha Johanna Lad, a son of the great show bull, Sarcastic Lad, and the first 35 pound cow, Colantha 4th's Johanna, the first cow to hold world's records in every division from one day to a year. The sire's dam is the first 34 pound cow, Aaggie Cornucopia Pauline, who heads the only combination of four direct generations of 30 pound cows and heads two of the 16 combinations of three direct generations of 30 pound cows.

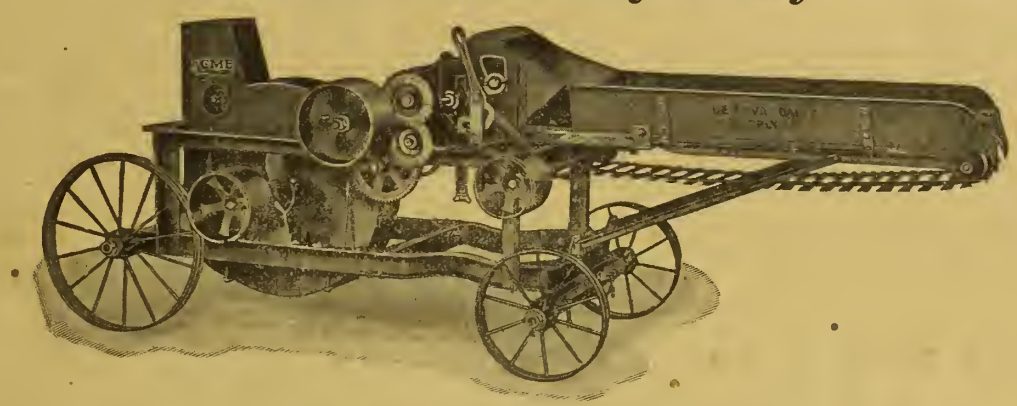
The dam is a cow of great producing ability, having produced nearly 29 pounds of butter in seven days. She is by Colantha Johanna Lad from the 31 pound cow Maid Mutual De Kol, dam of the great young sire, King Pontiac Champion, sire of eight 30 pound cows.

The Aro herd located at Cypress in Orange County is entirely out of the pure bred district, and keen buyers should make arrangements to be there as there will undoubtedly be some great bargains in the sale.

ACME

Feed Cutter and Silo Filler

A Size For Every Dairy



Your Silage Should Be Evenly Cut and Well Packed in a Leak Proof Silo

The Acme Cutter Does The Work

Light Running Safe Durable

Filling the Silo

THE spiral cutting knives are set at the correct angle and make a clean shearing stroke which cuts the silage—does not bruise or shred it. The silage produced is of uniform lengths—packs tight and avoids spoilage.

The rigid **STEEL FRAME** adds strength and durability not found in other cutters. It is securely riveted — can't warp or sag or throw the bearings out of alignment like the old style wood frame cutters.

Cutting Dry Feed

THE same Acme Cutter that fills your silo will cut up all kinds of dry feed and make excellent alfalfa meal. Use it with profit at all seasons of the year.

Cut all your dry feed. 25 per cent of all bulk hay fed to stock is wasted — trampled under foot or nosed out and not eaten. Run it through an Acme and eliminate this waste. Save $4.00 to $6.00 on every ton of hay you feed. Figure out what you can save.

Special hay feeding attachment gives all Acme Cutters enormous capacity. What are your requirements?

Order Early

Our stock is complete but the demand is heavy. Factory shipments are uncertain. Order your Acme now and have it ready for business when your corn is ripe.

SEND NOW FOR CUTTER AND SILO CATALOG

IDEAL GREEN FEED SILOS

LEAK PROOF **PERMANENT**

We use the finest grade of selected redwood tank stock in the **REFRIGERATOR DOORS,** in the staves and throughout the silo. It's hard to get. It takes time to transport material and erect the silo. **LOOK AHEAD—ORDER YOUR IDEAL GREEN FEED SILO NOW. WE HAVE THE STOCK AND CAN DELIVER THE GOODS.**

ARO HERD

35 Pure Bred Registered Holsteins

Tuberculin Tested

At the ARO Holstein farm, four miles southeast of Artesia and one-half mile south of

Cypress, Orange County

Tuesday, August 20th at 10 a.m.

While the herd is not large in numbers, it is one of superior excellence and combines the three great essentials

Type - Breeding - Conformation

There are daughters of such noted sires as

Colantha Sir Aaggie
Fairview Korndyke Lad
Arcady Pontiac Wayne Hengerveld
King Pontiac Netherland Segis
Juliana King of Rock
Mutual Piebe De Kol
King Segis De Kol Mead

from well bred dams, many with A. R. O. records, as high as 29.36 pounds of butter in seven days and by such well known sires as

Duchland Sir Pontiac Rag Apple
Colantha Sir Aaggie
Sir Skylark Ormsby Hengerveld
Fairview Korndyke Lad
Arcady Pontiac Wayne Hengerveld

together with seven young daughters and four sons of the great young sire at the head of this herd, COLANTHA AAGGIE SIR JOHANNA, 162569, a double grandson of COLANTHA JOHANNA LAD. The three nearest dams average butter seven days, 31.43 pounds and milk 647.70. This great sire will be sold and offers a wonderful opportunity to secure one of the greatest sires on the Coast.

Owing to the lack of time no catalog will be issued but tabulated pedigrees of every animal will be on hand day of sale.

Arrangements for credit can be made prior to sale.

What Breed of Sheep?

Written for California Cultivator By W. S. Guilford

THERE were never before so many operators of small farms going into the sheep business as this summer and fall.

The high price of wool—and of mutton as well—is the big incentive, but more and more are they finding that nothing else on the farm pays such a big dividend on the investment.

"What breed of sheep shall I buy?" is a question often heard. And the answer is the same as must be given to any question about breeds. There is no one best breed; all are good, some for one thing, some for another. And any of the breeds of sheep will do well on the small farms of the Sacramento Valley. There are Cotswolds here—and Rambouillets, and Shropshires and Hampshires — some Dorsets and some Corriedales. And there are many crosses and mixtures of these various breeds.

Rambouillets

Just now, with the high price of wool, Rambouillets are very popular. They shear a very heavy fleece, and as bred in California are good mutton sheep.

The Rambouillet is a big, smooth Merino that was developed from the Spanish Merino at the Royal farm at Rambouillet near Paris. Rambouillet rams generally have spirally curved horns; the ewes are hornless. It is reported that these sheep were first brought to America in 1840 and were called French Merinos. About 1860 they were brought to California and some of the best in the world are bred here now.

Rambouillets are very popular for crossing because of the increased weight of fleece in the offspring.

Cotswolds

The Cotswold is a big sheep, and has a heavy fleece of long open wool. It is an old English breed and belongs to the large long wool type. Other breeds of this type are Leicester and Lincoln. Cotswolds have been used on range flocks to increase their size.

Hampshires

The Hampshire is a medium wool mutton breed and produces a good carcass. This breed has been very popular on the range and small farms because of the size and rapid growth made by the lambs.

Hampshires have black faces, are larger than Shropshires. The wool does not cover the body quite so completely.

Dorsets

The Dorset is a horned sheep, an old English breed, medium in size, with white face and legs, both bare.

The breed is highly prized in England and the Eastern states for the production of "hothouse" or early lambs. The ewes milk heavily and breed twice a year.

Shropshires

A great many Shropshire rams have been used in Sacramento Valley flocks for many years. Most of the "black face" rams have been of Shropshire breeding.

This is a mutton sheep having medium wool which pretty well covers the face and legs. They produce a good mutton carcass and a fair fleece of wool. The breed was developed in the County of Shropshire in England and was imported to America in 1855.

Shropshires, Merinos and Rambouillets are the sheep most commonly found in California, there being more of Merino parentage than of any other.

THE HORSE AND THE MOTOR

By W. S. Guilford

I had a long visit a short time ago with a man who is now, and has been for many years past, one of the large dealers in mules and horses in California. He knows horses and mules as few men do and he likes them. He believes that good horses and mules are dependable "instruments" for doing any kind of work, yet he finds them being gradually replaced by motor power at many kinds of work and realizes that this is because it is possible to do this work more efficiently with the motors.

"I have been furnishing for a number of years a certain type of heavy drafter to one big company that has a lot of heavy hauling," said my friend. "These people like horses and like capable ones that are showy as well as big and strong. They sent home the last team they had hired from us a few days ago. All of their wagons have been replaced with motor trucks.

"We have a lot of horses and mules at work on ditch building jobs, road work and other construction work," he continued, "and this will continue for a long time. There are certain kinds of scraper work that stock can do better than machines, and stock for some kinds of farm work seems indispensable."

I know an old Irishman who has been driving mules on various ranches in the Sacramento Valley for over 30 years. He is a good mule man, understand them and likes them.

He was talking about the bean growing in the basin lands in the lower valley. The proposition there is to get the crop in quickly after the floods recede; large acreages must be plowed and harrowed and disked and harrowed and re-disked, a fine seed bed made, and in a short time.

"I don't believe these big high powered tractor outfits do as good a job as I can do with mules," said the old man, "but if they didn't do the work with engines it would never be done. With them they can work almost all of the 24 hours, and it's so hot that it is hard to get much of a day's work out of the stock in ten hours."

All of which is interesting as being the viewpoints of two horse and mule men.

MILCH GOAT RAISING

A new correspondence course on milch goat raising is now being offered by the University of California, Berkeley, through the division of agricultural education. The various breeds of milch goats are discussed, together with their feeding, care and management. Special consideration is given to the phases of the industry which would be of interest to those wishing to keep only a few goats. This course will fill a long felt want in many sections of the state.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Nasal Gleet

I have a mare 14 years old, in good condition. She has a good appetite but coughs some. After driving or working and being unreined and letting her head down there is a copious discharge from the nose. She has been in this condition to some extent since spring. At times she appears to be getting better but is worse again now. Can you tell the cause and what shall I do for her? — Subscriber, San Fernando.

A chronic discharge from the nose such as you describe may be caused by a cold that has affected the membranes lining the nostrils or may be due to a decayed or broken tooth in the upper jaw. If it is only caused by a cold you can dry it up by giving these powders in the feed. Powdered gentian four ounces, powdered nux vomica two ounces, powdered sulphate of iron two ounces and farina or fenugreek six ounces. Mix and divide into 16 powders. Give one powder in damp feed once a day or if the horse is particular about the taste in the feed and will not eat it then put a powder in a long necked bottle, add a pint of water, shake it well and give as a drench. If you notice that the discharge comes mostly from one side then it may be due to a faulty tooth on that side probably indicated by swelling. If you fail in your efforts then you better call a veterinarian and have him examine the teeth.

Distemper

We have a horse that was running in the field. One day he came up with a swelled head which lasted for a few days and then broke, discharging a yellowish matter. The skin has decayed around the openings and has left raw running sores. The worst one is in the glands of the neck. Please advise through the Cultivator.—Subscriber, Linne.

The common name for the trouble is distemper but in the books you will find it described under the heading "Strangles." It is due to a microbe and is contagious. It is considered a colt disease but occasionally older horses have it. Dress the affected parts with a solution of permanganate of potash and carbolic acid. Use half a dram of each, the permanganate and carbolic acid, to one quart of water. Inject it into the openings with a syringe and after washing the outside with warm water and soap dress it also with the solution.

Sow Eating Chickens

We have a splendid young brood sow with her first litter of pigs about six weeks old. In some way she has got started to eating chickens. We are feeding her milk, raisins, middlings, crushed barley and slop. Is there any way of breaking her of the habit without penning her up?—Subscriber, Del Rey.

It surely is not due to a lack of variety of feed in your case. It can not be accounted for and no remedy has been found. Once they have the habit they will eat one whenever they can catch one. Occasionally a sow will eat her own pigs, sometimes not beginning until the pigs are two or three weeks old then will eat one every few days. They may eat two or three and raise the rest or they may continue until all are gone. The only advice we can give is to either make pork of the sow or keep the chickens out of her reach.

Hollow-Hill Farm Guernseys

On account of his close relationship to the balance of our herd we are going to sell our JUNIOR HERD SIRE, the four year old bull

Cora's Glen 31541

Grand Champion at Riverside County Fair in 1916

His sire is an A. R. bull which has two A. R. daughters.

His dam has an A. R. record of 12,286.3 pounds of milk and 676.31 pounds of butter fat, average 5.5 per cent, made at ten years of age.

He combines the blood lines of many of the great members of the breed and traces 25 per cent to Imp. Masher's Galore and 12½ per cent to Governor of the Chene.

He is a show bull and is backed up by production records. Inquire of

Hollow-Hill Farm, Colton, Cal.

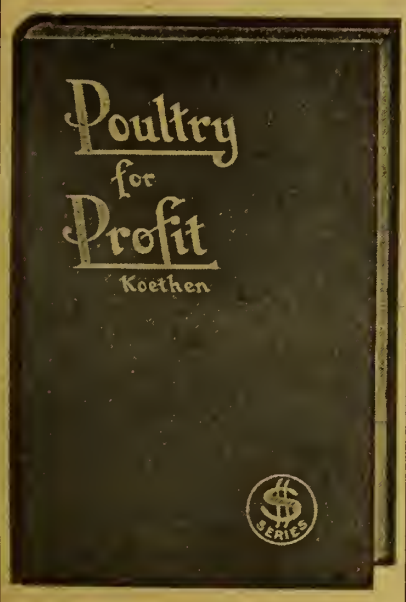
AMERICAN FERTILIZER

In anticipation of the thirteenth annual convention of the National Fertilizer Association; which was held in Atlantic City the week beginning July 15, the American Fertilizer issued a great pre-convention number. It is a book of 234 pages filled with information regarding America's fertilizing industry and is really quite convincing that American farmers are still using fertilizer.

Do not allow rubbish to accumulate at any time. If there is any burn or bury it without delay.

Poultry can be made to Pay



THERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe.

The Wasted Egg

Written for California Cultivator By Jean A Koethen

ACCORDING to recently published statements we are still letting 100,000 tons of eggs, worth about $60,000,000, go to waste between the hen and the consumer. This waste of 2,000,000,000 eggs, so badly needed for food, is the result of carelessness all along the line, carelessness in producing and gathering the eggs, carelessness in packing and marketing them, inexcusable carelessness oftentimes on the part of transportation companies in handling them.

What are we going to do about it, we who keep a few hens? The commercial poultryman is doing his part, doing it so well that during the past winter several carloads of choice California eggs were sold in New York for about the same price as that paid for near at hand fresh gathered eggs. The farmer is the chief offender, and since 80 per cent of our total egg supply is produced on farms, his carelessness results in monumental loss. Some of the responsibility rests, no doubt, on the backlotter, for, while his production is far smaller he is just as careless with the eggs he does handle.

The greater egg loss comes in hot weather, and the chief enemy of the egg in hot weather is the rooster. Eliminate the rooster from the laying pen in hot weather and you eliminate all the blood rings and heat-affected eggs. If a fertile egg is allowed to remain for any length of time in a temperature of 70 degrees the embryo begins to develop, and from that time on the egg is unfit for food. It makes little difference whether the embryo dies, forming a blood ring, or goes on developing. It is a dead loss in any case.

Infertile eggs are not proof against careless handling. If the mucilaginous coating is removed by washing, water may enter the shell, carrying with it germs from the outside of the egg, or too great evaporation may follow the removal of the coating, leaving a dried and stale egg. Again, an egg left in a dirty nest, or in a closed cupboard containing onions or other strongly odorous food soon absorbs some of the objectionable odor. All eggs should be collected twice a day and kept in a cool, clean, dry place until they are marketed, and they should be marketed twice a week. An infertile egg remains technically "fresh" for a couple of weeks, but it loses its delicate fresh-laid flavor in a few days.

An infertile egg may become contaminated by having its coating removed, and it may become stale from too long keeping. It may also be cracked, either from being laid in a nest which contains insufficient litter or from careless handling or poor packing. The best protection against cracking is a good strong shell, for an egg with a thin shell often cracks with the gentlest handling. Sometimes these cracks are so tiny as to be invisible, but the egg is spoiled just the same.

Not infrequently it happens that the egg leaves the farmer's hands in perfect condition but is cracked in the hands of the truckman or the express company, or the case is left standing in the broiling sun on the station platform. For this sort of carelessness the farmer has no remedy, except in so far as he can control the truckman, and such control is gained only by organization. An efficient organization can see that its eggs are properly packed and properly handled. It was probably such an organization at Petaluma that made it possible to send eggs from San Francisco to New York. Eggs destined for shipping must have strong shells and strong containers, must be infertile in the beginning and handled with care all the way.

The loss of an egg now and then may seem trifling to the producer who handles thousands of eggs, but it means the waste of the feed which went into the egg and of the labor which produced and candles and markets it. We are told that at present it costs around 40 cents to produce a dozen eggs. Every egg produced only to be destroyed means therefore a dead loss of from three to four cents. Worse than that, it means loss of life, for one egg would be a fair meal for a Belgian baby. Such waste must be stopped, and it can only be stopped as every producer sees to it that his eggs, be they many or few, are not wasted.

THE EGG BREAKING PLANT

To assist egg breakers in selecting effective apparatus and in arranging their plants in a sanitary and economical manner, the United States department of agriculture has issued Bulletin 663, "The Installation and Equipment of an Egg-Breaking Plant."

Egg-breaking plants are located in producing sections and near many of the large markets. They buy the "seconds," which are not marketable in the shell for ordinary food use, but which when properly handled are perfectly wholesome, remove the shells and freeze, can or dry the contents. The frozen, dried, or canned product is sold largely to bakers for use in pastry.

Room for Washing Utensils

"An egg-breaking plant," says the bulletin, "should have an insulated, refrigerated chill room, candling room, freezer, and breaking room. Adjoining the breaking room should be a room for the washing and sterilizing of utensils.

"The breaking and sterilizing rooms should have a plentiful supply of natural light. The walls and ceilings should be plastered and white enameled, and the floors should be concrete with trapped drains. In the partition between the two rooms a sliding window for the transfer of equipment should be built.

"The freezer should be equipped with shelves of brine piping, through which brine is circulated for freezing the cans of liquid egg.

"The candled eggs should be taken to the breaking room in metal pails, because cases with the accompanying packing material are dirty. Leaking eggs after candling should be placed on special trays for transferring to the breaking room.

The Egg-Breaking Outfit

"The egg-breaking oufit consists of a tray, on which is placed an open rack for supporting the cups, and a detachable knife on which the eggs are broken. This knife rests in slots in standards fastened to the ends of the breaking tray. Glass cups should be used for the grading of the opened eggs, because certain types of bad eggs can not be detected in nontransparent containers. When whites and yolks are separated it should be done by means of a sanitary mechanical device.

"The egg-breaking tables should be covered with a nonabsorbing material such as metal or porcelain.

"A churn for mixing the egg before freezing should be provided. It should be constructed so that it can be readily washed and sterilized.

"A lavatory with knee or pedal-valve attachment should be installed in the breaking room near the transfer window for the washing of hands after breaking bad eggs.

"White uniforms should be provided for operators in the breaking room.

"The sterilizing room should be furnished with sinks and steam sterilizers. The sinks should be equipped with drains and mechanical rinsers and should be supplied with hot and cold water and connected to trapped drains."

HATCHERY TO PALO ALTO

J. H. Stubbe, who formerly conducted the hatchery at Campbell, has moved the plant to Palo Alto. It will hereafter be known as the Stubbe Plant and Hatchery.

SAFETY FIRST

"Why," asks a Missouri paper, "does Missouri stand at the head in raising mules?"

"Because," says another paper, "that is the only safe place to stand."

Eggs all through the MOULT!
SHORTEN the moult and lengthen the laying. Globe A-1 Mash (dry buttermilk added) will do it. The live lactic acid bacilli in the dry buttermilk will keep your flock in glowing health: (bulletin 162 U. S. Agr. Exp. Sta., Berkeley).
For Hogs A-1 Hog Feed 10% dry buttermilk) will save from $6 to $12 on fattening each hog.

If You Want an "Inexpensive" Piano Don't Buy a "Cheap" One

There is a big distinction between the words "cheap" and "inexpensive." Some folks like to get things "cheap"—only to find that in the end they proved to be the most expensive—because they had to buy another that would give service.

Now we do not sell "cheap" pianos, but we do carry a number of "inexpensive" instruments. The prices are within the reach of most every home. These Pianos will render many years of satisfactory service—they are good, substantial values and are worth every dollar asked. We gladly arrange convenient terms of payment.

We invite you to call at any of our stores—or write us asking for illustrated catalogues and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

The American Flag

By Joseph Redman Drake

When Freedom from her mountain height
Unfurled her standard to the air,
She tore the azure robe of night,
And set the stars of glory there.
She mingled with the gorgeous dyes,
The milky baldric of the skies,
And striped its pure celestial white
With streakings of the morning light;
Then from his mansion in the sun,
She called her eagle bearer down,
And gave into his mighty hand
The symbol of her chosen land.

Flag of the seas! on ocean wave
Thy stars shall glitter o'er the brave;
When death, careering on the gale,
Sweeps darkly round the bellied sail,
And frightened waves rush wildly back
Before the broadside's reeling rack,
Each dying wanderer at the sea
Shall look at once to heaven and thee,
And smile to see thy splendors fly
In triumph o'er his closing eye.

Flag of the free heart's hope and home!
By angel hands to valor given;
Thy stars have lit the welkin dome,
And all thy hues were born in heaven.
Forever float that standard sheet!
Where breathes the foe but falls before us,
With freedom's soil beneath our feet,
And freedom's banner streaming o'er us?

JERRY OF THE DUMP

By Edward Ferguson, in Dumb Animals

EVERY well regulated suburban town boasts a public dump, which is usually a large low-lying lot where all refuse, tin cans, worthless junk and other varieties of goat food are disposed of. The town of X—— supported such a dump, and the dump supported Jerry. Jerry was a nondescript, wire-haired mongrel who belonged to no one or nowhere in particular. He had just drifted in, and because the public dump afforded a good hunting ground for cast-out bones and other tid-bits that made it possible for him to eke out a precarious living, he had adopted it as his home.

The rubbish wagon drivers all knew Jerry, who was always on the job, waiting expectantly for each new load to be dumped, whereupon with paws and snout busy, he rummaged through the mess for whatever fortune had seen fit to favor him with.

Likewise he was well and favorably known to a crowd of young ragamuffins, who frequented the dump and rummaged, as Jerry did, for what ever they could find.

Some blocks away, in the town's best residential section, lived little Mary Clark. Mary was three, and the only daughter of the town's bank president. She was a carefully nurtured, carefully watched, carefully dressed child, carefully tended by a carefully selected nursemaid. But withal she was a child.

In consequence of which, one day the hue and cry went forth, Mary was lost. She had slipped out unobserved and disappeared. A frantic mother and the equally frantic nursemaid, all the neighbors, the father, and most of the men of the town searched high and low, near and far; no nook or corner, barn or field, was overlooked, but Mary could not be found.

Into the night, with lanterns, torches and flashlights, with shouts and wails, the search went on.

Morning dawned to find the town intent on nothing but the lost child—wild rumors were afloat—rumors of gypsies and kidnapping. The three-man police department was frantically telephoning all neighboring towns and demanding a general round-up of all tramps and suspicious characters.

Down at the dump things went on as usual. Two loads had been delivered and disposed of when Mike Casey, one of the drivers, noticed that Jerry was not in evidence.

"Where's the dog?" he asked his helper.

"Sure and I ain't seen him," was the reply.

A little later the aforesaid ragamuffins appeared and proceeded with their daily search. Near a pile of refuse one of them came upon the dog. He was lying flat, nose on paws, gazing straight ahead. The boy called and approached him; and Jerry did a thing he was never known to do before or since.

He straightened up, every hair on end, eyes ablaze, fangs bared, and snarled his defiance. The boy, frightened at his erstwhile friend's attitude, ran back to his companions. He told his story and Casey overheard it.

"Let's go look," the big Irishman suggested.

Jerry knew Mike and suffered him to approach.

"What's wrong wid yez," he asked the dog, and Jerry wagged his stump of a tail and pawed at what appeared to be a loose pile of old newspapers. The edge of a child's dress became visible. Mike stooped to assist the now frantically pawing dog, and uncovered—Mary—sound asleep.

Apparently the child had wandered to the dump, become tired, and had gone to sleep. Jerry, as her self-appointed guardian, had nosed the old newspapers over her and mounted guard.

He is still "Jerry of the Dump." All the banker's persuasion could not coax him to take up his quarters in Mary's palatial home. But each day at noon he can be seen sitting on a pile of rubbish, eagerly watching the corner, head to one side, one ear cocked, and each day at noon a little girl, with a basket on her arm, attended by a spick and span nursemaid, turns the corner. And each day at noon, when Jerry sees them coming, he barks his delight and wiggles himself into a frenzy of joy.

ICE CREAM A NOURISHING AND ECONOMICAL FOOD

Light, but rich, healthful foods are needed for variety in the diet. Good ice cream is to the boy or grown-up not only a delicacy, but a food that carries rich nutrients needed by the body. It is free from the injurious effects of soggy pastries, and more invigorating than the best of tonics.

One quart of ice cream (of required fat standard) on an energy basis, equals 8.75 pounds strawberries, 5.11 pounds bananas, 6.96 pounds apples, 1½ pounds round steak, 1½ dozen eggs.

Ice cream is commonly thought of and used as a dessert by most people. As a dessert, it is delicious and palatable. As a food, it is nourishing and economical.

It is more a necessary part of every meal than a dessert. "There are unmatchable food values in this combination of cream and sugar."—Roud McCann, Colorado Agricultural College.

COMPARATIVE SUGAR PRICES

During the first year of the war, the United States consumed more than 4,000,000 tons of sugar. The wholesale price of refined sugar in this country at the present time is $7.30 per hundred pounds, as compared with $9.15 last August. The regulated wholesale price of sugar in various foreign countries makes an interesting comparison: United Kingdom, $12.59 per hundred pounds; France, $12.28; Italy, $26.30; Canada, $8.07;; United States, $7.30. An increase of one cent per pound in the price of sugar in the United States would take at least $82,185.820 out of the pockets of American consumers in one year.

The Cultivator Patterns

8642—Girls' Bolero Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The smart bolero is very simple, and it is short enough to show the bright silk underneath.

8925—Ladies' Shirtwaist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The front closing of the waist is double-breasted.

8913—Ladies' and Misses' Blouse. Cut in sizes 16, 18 years and 36, 38, 40, 42 and 44 inches bust measure. The front edges of the blouse are turned back to form reveres at the neck.

8893—Ladies' Negligee. Cut in sizes 36, 40 and 44 inches bust measure. The negligee has a three-gored skirt section which is shaped to fit without gathers.

8909—Ladies' Maternity Dress. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The fichu collar is draped to the waistline.

8924—Girls' Dress. Cut in sizes 6, 8, 10, 12 and 14 years. The one-piece skirt section is gathered all around to the waist and is joined to the panel at the front.

8889—Ladies' Three-Gored Skirt. Cut in sizes 24, 26, 28, 30, 32, 34 and 36 inches waist measure. The skirt may be worn with or without the narrow belt.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all paterns. Address

Br'er Tater ain't skeerin' up a ghos' wen he say we alls mus' eat less wheat en less meat en save all de fat en sugar we kin. We has jist got ter feed dat big army er fightin' sojer boys, en we kin do hit by eatin' right smart mo' taters en garden sass en eatin' mo' fish en game 'stid er pork and beef. Ef we alls don't gin ter feed dem sojers right now we'll be feedin' somebody 'fo' long en it won't be us.

ENJOY FRUITS IN SEASON—SAUCE FOR YOUR MEAT

IN THE midst of the steaming and aching of canning and drying let's pause a while to pile high the old-fashioned fruit stand with rosy peaches, purple plums and pendant grapes. Place it on the hall table or sideboard where family and friends may feast on its loveliness of color and form and the rich perfume of these summer fruits.

And, busy housekeepers, while storing for winter enjoy the fruits in season—serve them fresh or serve them cooked, serve them hot or serve them cold—let fruit be part of every meal as a dessert or as a salad, and above all as a sauce for meat.

"Certainly," said Squire Hardcastle, "there is no better relish for game, mutton, lamb, fowls of every sort, even roast pork, than pruin sauce." To the Squire's blue plums let's add apples and peaches, served piping hot as an accompaniment for meat; and soft, ripe peaches, fresh and unsweetened make an excellent summer partner for bacon and salt fish.

If you are not accustomed to fruit served hot, try it. The taste for it is worth acquiring. Don't destroy the natural flavor by sugar and spice or over cooking. Treat fruit with the same respect you would a potato—that is, cook it just tender through and serve it hot. Cooked in this way the real fruit juices and flavors are retained. Some fruits need no sugar at all and others merely a suggestion. Educate the family to demand fruit acids as an accompaniment of meat to replace part of the starch usually consumed. Fruit is food; teach the family to enjoy it by serving it well, and better health will repay your good cooking.

With Bacon

With crisp bacon serve apples, piping hot and bursting with juice, baked without sugar. Or cut the apples from the core without peeling, place in a deep pan with a very light sprinkling of sugar and half a cup water. Cover and steam until tender; remove cover, sprinkle top with brown sugar or brush with syrup and brown in hot oven. Serve from dish sizzling hot.

With Roast or Steak

Ripe peaches or pears steamed until just tender through make an appetizing sauce for meats. Peel but do not cut. Cook in a saucepan, tightly covered, with just enough water to prevent burning. Allow one tablespoon of sugar to a dozen peaches or pears. Steam until tender and serve hot. Be careful not to overcook.

With Chicken

Blue plums are especially good with chicken. Add a very little sugar and little or no water. Heat slowly to prevent burning and cook until plums are broken. Serve hot. Peaches or apples quartered and cooked clear in a syrup of water, sugar and a bit of lemon make a delicious accompaniment for chicken. Serve rice with this combination.

ENTIRELY WHEATLESS BREAD

This recipe is being sent out by the United States office of home economics:

All of These:

One and three-fourths cups liquid, one tablespoon corn syrup, one-fourth cake yeast, two teaspoons salt, one whole egg.

With One of These:

Three and three-eighths cups barley, or two and three-fourths cups ground rolled oats.

And One of These:

Two and one-half cups corn flour, two and one-eighth cups rice flour, two and three-fourths cups sweet potato flour, two and one-eighth cups (scant) tapioca flour.

Make a sponge of materials under the first group (except egg) and one-half of ingredients used from second and third group. Sponge should stand in warm place until very light, at least two hours. Work in balance of substitute mixture when sponge is light. Work in egg beaten slightly. Shape into loaf. Place in pan. Brush top of loaf with melted fat. Let raise to double bulk and bake in loaf pan in hot oven for one hour.

DRIED FRUITS

Raisins: Associated prices 1918 are:
Muscats: Packages seeded, fancy, 36-16s, 9.625; fancy, 48-12s, 7.75; choice, 36-16s, 9.125; choice, 48-12s, 7.375. Bulk seeded: 25-lb. Bakers, 8.00; 25-lb. fancy, 8.85.

Thompson Seedless; packages recleaned, 48-16s to case, 9.90; bulk, recleaned, 36-12s to case, 8.00; package, recleaned, 25-lb. boxes, 9.25. Sulphur bleached — northern stock: Bulk, 25-lb. boxes, choice, 10¼; bulk, 25-lb. boxes, fancy, 10¾; bulk, 25-lb. boxes, extra fancy, 11¼. Soda dipped — northern stock — Bulk, 25-lb. boxes, 10.

Loose: 1-crown, 25 lb. boxes, 8½; 2-crown, 25 lb. boxes, 7½; 3-crown, 25 lb. boxes, 8; 4-crown, 25 lb. boxes, 8¾.

Layers: 3-crown, 20 lb. boxes, 1.85; 3-crown, 20 1-lb. trays to box, 2.00; 4-crown, 20 lb. boxes, 2.10; 6-crown, 20 lb. boxes, 2.95; 3-crown, 10 lb. boxes, 1.05; 4-crown, 10 lb. boxes, 1.20; 6-crown, 10 lb. boxes, 1.65; 3-crown, 5 lb. boxes, .65; 4-crown, 5 lb. boxes, .70; 6-crown, 5 lb. boxes, .90.

Sun-Maid clusters, 20 1-lb. cartons to box, 2.35.

Imperials, 4 5-lb. cartons to box, 3.40.

Vineyard run, 50 lb. boxes, 3.90; 100 lb. boxes, 7.50.

Sultanas. Packages, recleaned, 48-16s to case, 9.65; bulk, recleaned, 25-lb. boxes, 9.00.

Peaches — California Peach Growers quotes opening prices for 1918 crop f. o. b. factories California. Prices guaranteed to December 31.

Bulk basis and boxes unfaced 1 and 2 cents more.

	Practically Peeled	Yellows (Old style)	Muirs (Old style)
Standard	12⅞c	11¼c	11⅜c
Choice	13⅜c	11¾c	11⅞c
Fancy	14⅜c	12½c	12⅞c
Ex. Fancy	15½c	13¼c	14c
Slabs		10¼c	

Prunes and Apricots. The Prune and Apricot Growers' Association have named following prices on apricots:
Standards 9½
Choice 13
Extra Choice 14½
Fancy 16
Extra Fancy 17½
Extra Moorparks 19
Slabs 11

Cash on delivery price on all grades will be 8 cents with the exception of standards and slabs on which it will be 6 cents.

Prunes: The government will take all the 50-60; 60-70; 70-80 sizes. The quotations sent to the trade last night are as follows:

The bulk prices will be:

Sizes:	Price per lb.
20-30	17
30-40	10¾
40-50	10
50-60	9
60-70	9
70-80	8¾
80-90	8¼
90-100	7¾
100-120	4¾
Above 120	4¼

One cent per pound, and one and one-fourth cents per pound will be added for 50 and 25-lb. boxes.

HONEY

Jobbers' prices:
White extracted .....20@22
Light amber extracted .....15@18
Amber extracted 14
White comb, cs. .....4.50@6.00
Light amber comb, cs.....3.50@4.00
Beeswax 34

HAY

Under date of August 3, Scott, Magner & Miller says:

Receipts past week, 2432 tons. If the receipts continue as heavy as for the past two or three weeks we believe there will be no question but what a lower range of prices will prevail on this market as it has been most difficult during the week to maintain our present quotations.

Receipts of alfalfa have been moderate. Difficulties in pressing the hay probably are to blame. Considerable hay by cars from the interior districts of various qualities arrived during the week.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:
Fancy Wheat Hay, large five wire bale .....26.00@27.00
No. 1 Wheat or Wheat and Oat Hay .....22.00@24.00
No. 2 Wheat or Wheat and Oat Hay .....19.00@21.00
Choice Tame Oat Hay.....24.00@26.00
Other Tame Oat Hay .....21.00@23.00
Wild Oat Hay .....18.00@22.00
Barley Hay .....18.00@22.00
Alfalfa, first cutting .....16.00@20.00
Alfalfa, second cutting .....22.00@24.00
Stock Hay .....18.00@20.00
No. 1 Barley Straw, bale .....50@80

GRAIN

Wheat: Base price for 1918 crop common white hard to farmers is $2.20 per bushel of 60 pounds, delivered in bulk at terminal warehouses. For sacks add 9 cents, less tare for weight of same.

Barley—New No. 1 feed, 2.40@2.55 per cental; milling, 2.55@2.65; off grades quoted down to 2.45.

Oats: Red feed, 2.60@2.70 per cental; do. seed, 2.75@3.00.

Corn: Nominal; none offering.

SEEDS

Prices in round lots, lb.:
Millet, recleaned.....5@5½
Flax .....8@8½
Hemp .....5½@6
Rape .....2½@5

Citrus Fruit Market

Los Angeles, Cal., August 6, 1918.

Eastern markets are snapping up all available supplies of oranges with no haggling over prices. As will be noted in auction sales Valencias are bringing in some cases over $9.00. There are few Valencias left in Southern California, at the present time only about 1500 cars, whereas at this time last year there were over 5500. With such a small supply on hand to fill the market until months later when the navel crop will come in, orange growers who are lucky enough to have anything to sell cannot anticipate anything but the very best prices.

Lemon prices have been lower during the past week owing to large receipts from California and especially heavy receipts from the Mediterranean. Presumably with the extremely hot weather now prevailing in the East all these stocks will be cleaned up and prices will again advance.

Shipments

Shipments of citrus fruits to date since November 1, 1917: Southern California; oranges 12,694 cars, lemons 4689, total 17,383. To same date last season, oranges 35,189, lemons 6955, total 42,144. Central California this season; oranges 2536, lemons 115, total 2650. Last season to same date; oranges 4655, lemons 164, total 4819. Northern California; oranges 203, last year same date, 845.

AT THE AUCTIONS

July 30

New York: 7 oranges, 1 grapefruit, 4 lem. Val. 6.00-9.10, lem. 2.60-6.60, grapefruit 2.90-4.25.
Philadelphia: 2 cars Valencias, 6.50-8.90, 1 lem. 4.90-6.70.
Cleveland: 2 cars lem., 6.30-7.85.
Pittsburg: 2 cars. Val. 6.70-8.45, 1 lem. 6.20.

August 2

New York: 7 Val. 6.65-9.30, 1 grapefruit 3.45-4.95, 1 lem. 3.80-5.55.
Cincinnati: 1 lem. 3.80-6.35.
St. Louis: 1 Val. 7:15, 2 lem. 4.05-7.20.
Boston: 2 Val. 5.75-8.45, 2 lem. 7.15-7.80.

August 1

New York: 11 Val. 6.55-9.55, 2 lem. 3.25-5.45.
Pittsburg: 1 lem. 6.60-7.65.
Boston: 1 Val. 8.55, 2 lem. 5.60-7.65.
Philadelphia: 2 Val. 6.35-8.90, 1 lem. 5.65.

August 5

Cincinnati: 1 Val. 5.70-7.00, 2 lem. 3.95-7.05.

Brentwood Irrigated Farms

In Eastern Contra Costa County.

Land Planted to Alfalfa, also first class orchard land. Tracts of twenty acres and up with easy terms of payment. For Prices and Descriptive matter address

Balfour Guthrie & Co., Land Dept., 350 California St., San Francisco

Cleveland: 1 Val. 4.95-8.10, 1 lem. 6.00-6.75.
St. Louis: 1 Val. 7.25, 2 lem. 5.45-6.65.
August 6
New York: 6 Val. 5.85-9.00, 2 grapefruit 3.20-5.30, 3 lem. 1.25-6.30.
Phiiadeiphia: 5 Val. 4.90-8.10, 1 lem. 5.65-7.05.
Boston: 3 Vai. 5.65-7.55, 2 lem. 2.70-3.25.

MARKET NOTES

Summer crop of canning tomatoes is being delivered freely. The acreage is perhaps 30 per cent greater than last year. Weather conditions have been most favorable.

Shipments of potatoes have been normal in the southern end of the state. Shipping of the spring crop has been nearly finished. Insects and fungus have been more serious than in former years and an abnormal quantity of culls has resulted.

Onions near Stockton have been badly infested with thrips. The acreage will be less than last year, but with favorable weather conditions and not too serious insect injury, the output will be close up to normal.

The federal crop reporter estimates that at least 2000 acres of asparagus have been plowed out in California this year. This year's output was nearly ten per cent short of that of 1917. The ioss is due to unsatisfactory labor conditions.

Turlock reports prospect for watermelon crop fairly good; in fact, much better than last year. Shipments are earlier; sizes about the same as last year, but few aphis; some damage from blight; prices ranging $19 to $29 per ton.

Colorado celery began going to market on July 15, but the bulk of the crop will not be moved until September.

Oregon is becoming a great broccoli shipping center. Field setting for this season's crop is just ending, and in spite of dry weather shows good start. Acreage is reduced 30 per cent, but production will be greater because of better seed than last year.

The federal bureau of crop estimates finds that there has been an increase in the planting of cabbage for krout making by about 13 per cent.

Caiifornia gariic has been confronted by such unfavorable weather conditions that this year's yield will not be 60 per cent of normal. Growers are receiving from six to nine cents.

Fruit and garden truck shippers are concerned over having losses due to delay in transit made good by railways under government control. Heretofore any loss caused by negligence or inability of the railway to make prompt delivery resulted in a claim filed with the company by the shipper. This has usually brought recompense for the loss. As yet, there is no information as to the attitude of the government regarding the great number of iosses which unsatistory shipping conditions during the past few months have caused.

The bureau of markets has established an inspector and reporter at Turlock melon and cantaloupe shipping point.

Central California is now shipping out great numbers of cars of Thompson Seedless grapes.

The heaviest fresh fruit shipper from California at this moment is the pear.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, United States department of agriculture, report is made of the following shipment of cars of products from California for the week ending July 29: Apples, 9; apricots, 101, (shipments of apricots cover much of the month of July because of delayed reports); cantaloupes, 72; dried apricots, 9; dried beans, 30; dried peaches, 1; dried pears, 3; dried peas, 2; dried potatoes, 3; dried prunes, 9; garlic, 9; grapes, 108; loganberries, 13; mixed fruit, 124; mixed vegetables, 54; mixed fruit and vegetables, 32; mixed dried, 2; onions, 34; peaches, 174; pears, 419; plums, 189; potatoes, 460; raisins, 170; seed spinach, 1; tomatoes, 39; watermelons, 106; Arizona cantaloupes, 261; Arizona mixed fruits and vegetables, 1; Arizona grapes, 27; Arizona watermelons, 5; Nevada cantaloupes, 15.

From post card reports to the Los Angeies branch of the bureau of markets, United States department of agriculture, report is made of the following shipment of cars of products from California for the week ending August 5: Apples, 6; apricots, 50; cabbage, 3; cantaloupes, 310; dried apricots, 7; dried beans, 40; dried peaches, 2; dried prunes, 9; garlic, 6; grapes, 257; lettuce, 3; logan berries, 8; mixed fruit, 147; mixed vegetables, 45; mixed fruit and vegetables, 29; mixed dried fruit, 4; nectarines, 5; onions, 51; peaches, 1020; pears, 667; peppers, 1; piums, 238; potatoes, 214; raisins, 169; strawberries and other berries, 1; tomatoes, 22; watermelons, 78; Arizona cantaloupes, 27; Arizona watermelons, 5; Nevada cantaloupes, 9.

WEATHER ONDITIONS

San Francisco, Cal., August 3, 1918.

Stations	Rainfall Wk.	Season.	Norm.	Temp. Max.	Min.

T indicates Trace.

Squirrel and grasshopper drives in Glenn County under the leadership of Harold E. Wahlberg have been a feature of the season's activities of the farm bureau army.

"MORE FOOD"

"More Food" is the command coming from Europe and from the leaders of our own nation. It does not come as an appeal; it is a command from the people who are fighting for the liberties of the world, and we are all hastening to obey. But there is a shortage of horses, of mules, of farm labor; hence improved implements, machinery and farm power must be secured. For this reason the tractor never attracted the attention which it has for the past few months. Producers are asking: "Is the tractor reliable?" "Do the implements drawn by it do as effective work?" "Is its operation too expensive?" and a thousand and one other questions.

They Will Be Answered

Now comes the opportunity of answering these questions. On September 17-21 there will be a demonstration given by members of Traction Engine and Implement Dealers' Association near the city of Los Angeles in fact, half a mile east of the city limits on the Whittier boulevard. This is the third annual demonstration, and, as usual, there will be men there qualified to answer the questions above referred to. More, the tractors will be put through their paces. There will be 40 models of tractors displayed and demonstrated, and a far greater number of various implements and accessories. Big circus tents, which the management assures us will cover 60 acres of ground, are to be erected. There will be tractors from the small hand operated garden cultivator type to the monster 75's.

Special features will be announced in proper time.

NO KEROSENE ON TIRES

Here's a suggestion from the Goodrich Rubber Company. When one washes the car with a mixture of kerosene and water make sure the liquid does not reach the tires. Washing cars and washing tires are two entirely different propositions.

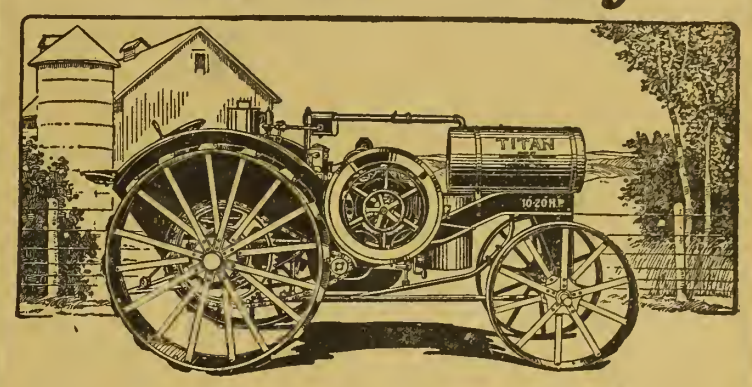
A common method when washing a a car is to mix kerosene with water. This is advisable when washing the body or wheels, to remove mud and dust from the varnish, but no kerosene should reach the tires because kerosene eats rubber. Water alone is best for washing tires. Soap and water will not injure the tire provided the tire is wiped clean with a sponge dampened with clean water and then dried with a well wrung cloth.

In many sections of the country the main traveled highways are well oiled. After every run on an oil road it is imperative that the tires be washed thoroughly to make certain all oil is removed. If it is impossible to remove oil and dirt that has become caked on the tire with water alone, water slightly diluted with kerosene or gasoline may be used safely provided the tire is cleaned and perfectly dried afterwards.

Unusual care should be exercised with tires having been run several thousand miles. In most instances such tires have many small cuts and very often have parts of the fabric exposed. Oil of any kind which seeps into these small crevices and reaches the tire fabric tends to separate the fabric and deterioration sets in. Such holes should be, and can readily be repaired by plugging with rubber cement.

In melting chocolate always butter the pan to avoid waste.

Tractor Safety



FOR twelve years and more, shrewd and careful American farmers have kept us busy filling their orders for **International, Mogul,** and **Titan Kerosene Tractors.** In those twelve years our tractors have had to meet every possible combination of field and climate conditions. The types and sizes we sell today are the ones that have successfully met every test. Any one of them is a safe tractor to buy.

One great advantage to farmers who buy our tractors is the fact that we can also supply all the implements and machines that go with the tractor. We know farm needs. Buying from us, you get a complete, well balanced outfit for field or belt work.

Another advantage is our extensive dealer and branch house organization. A telephone call to a nearby dealer brings you promptly a repair, replacement, or adjustment for any machine we sell.

Look at it any way you will, you cannot make a safer tractor investment than to buy an **International, Mogul** or **Titan** kerosene tractor. See our dealer in your town, or write us for full information about a safe tractor for your farm.

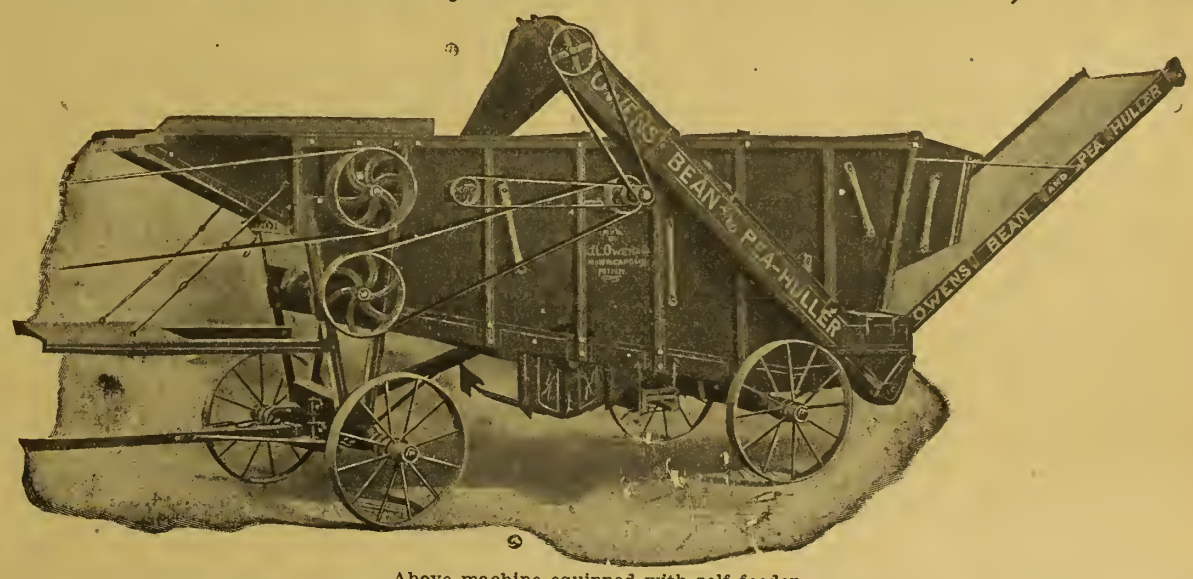
Owens 20"x32" Double Cylinder Bean and Pea Threshers, Third Size



Above machine equipped with self feeder.

Owens Bean Threshers made in six sizes from the largest to the smallest size, embody the essential features necessary to **thresh all varieties of Peas and Beans** direct from the vines without splitting the seed.
—They have more separating space and capacity than any other machine on the market.
—If you need a Pea or Bean Thresher at all get an "Owens."
—They are the Standard the world over. Built in sizes to suit any size grower, from the smallest to the largest, and there are none better at any price.

Send for Free Catalogue.

Threshers in stock at Lompoc, Santa Maria, Guadaloupe, Watsonville and Salinas.

G. H. McLean, Factory Representative, Lompoc, Cal.

A Message from the Secretary of Agriculture to American Farmers

TO THE PATRIOTS ON THE FARMS:

You are asked to undertake another offensive—to go "over the top" this fall for a great harvest of wheat in 1919. I need give only a few figures and facts to impress you with the increasing and urgent need of our people, our armies, the allied peoples and their armies for large supplies of American wheat.

Our reserve supply or carry-over from the 1917 crop is practically exhausted and is the smallest on record. The need of building up reserves of wheat is evident. Although this country produced a small crop of this grain in 1917, the total exports of wheat in excess of imports, including flour in terms of wheat, amounted to approximately 100,000,000 bushels for the year ending June 30, 1918. This is in comparison with 178,000,000 bushels exported in 1917, 236,000,000 bushels in 1916, and 331,000,000 bushels in 1915. It was possible for the United States to export wheat in large quantities in 1915 and 1916 only because of the large wheat crops of 1912-13-14-15, which gave this country an accumulation of stocks of this grain. Both the 1916 and 1917 crops were smaller than any crops since 1911 and besides this there was a greater demand for seed wheat and an increased population to be fed.

Moreover, it must be borne in mind that the carry-over in all the ten importing countries in Europe was practically exhausted this year before the new harvest; that the normal requirements of the exporting countries are increasing instead of diminishing; that some losses in storage and transit may be expected to continue; and that it is highly desirable that a surplus should be accumulated as insurance against partial crop failure next year.

You have been asked to sow to winter wheat this fall not less than 45,000,000 acres — an increase of 7 per cent over last year's sowing — and the Department has suggested that an even greater area, 47,500,000 acres, is desirable. The increased planting asked of each State has been carefully determined with regard to its local conditions and its reasonable capabilities. Your county agent can tell you the quota assigned to your State and you can apply the responsibility to your case.

You have occupied and do occupy the first line trenches of the food army. You have to fight difficulties too. I am not unmindful of these. In the Department of Agriculture we consider them daily, and daily we give our best efforts to help you meet them. You know of the difficulties in your community, but I know of them in many communities of many States, and so seriously do they impress me that I might almost consider them insurmountable had not American farmers last year, and again this year, revealed the true American fighting spirit and ability to meet serious situations. They will not let the war fail because of deficient food production.

Let us sow liberally for a big harvest in 1919. It has been called the Liberty Wheat Harvest. We all hope it will be. But let us undertake the task with the determination that we will sweat our blood for many more if need be before we yield one measure of our freedom to a Prussian domination. Let us fight in the furrows.

D. F. Houston.

Secretary of Agriculture.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The hog belt and the corn belt have been practically synonymous, and as a rule the larger hog producers have felt that the only—with accent on the only—satisfactory hardening feed was Indian corn, but during the past few years the entire Southwest, or, we may say, the semi-arid portion of the United States from Oklahoma to the Pacific, has been securing excellent results from sorghum grains. Analysis shows these to be of nearly the same feed value as Indian corn. In some sections durra, Jerusalem corn, rice corn, or Egyptian corn, has been the favorite. In other sections kafir has been generously planted. A more recent favorite is feterita, but in California we believe there has been more general planting of milo. One reason for the favor shown to yellow milo in California is apparent from a look at cover of this issue of the California Cultivator. This photo was taken in the Imperial Valley which produces thousands of tons of this grain. Down there they call it "corn", which is not a fortunate term, for it sometimes confuses it with the grain of which this country produces nearly three billion bushels. There will never be that amount of milo produced, but it is a wonderful grain, and California may well encourage its more general planting.

THE GRANGE

Frank L. Hunt, master of the California State Grange, gives us a word regarding the work of that great organization in California. It is one of California's oldest institutions, but, strange to say, is entirely confined to the sections of the state north of the Tehachapi. It is worthy of more general extension, for its years of service in this country have resulted in the accomplishment of much good.

ANOTHER LABOR SAVER

Every item which calls attention to the saving of a man or a number of men in labor operations is of value. Hence we are glad to call attention to the article on Page 149 of this issue, written by Professors Woglum and Prizer of the department of agriculture. The department costs this country many millions annually, more than a score of them we believe. It seems like a great sum, but it is continually maintaining in the field men investigating economic as well as scientific questions. Some of the scientific investigations have yielded little to the practical farmer. Hence it is well to note when these practical man saving devices are brought to the attention of practical workers. Mr. Woglum has been engaged in fumigation investigations for many years, and his work has resulted in many such practical aids to the citrus grower.

GAS IS UP

Gas has had another mark-up, this time by order of the fuel administration. It is not sufficient to cause material shrinkage in its use, and it is now hoped that there will be no necessity for issuing "gas cards" or of putting any serious restrictions on its sale. To the end that it may not be necessary to do this, may we not all be watchful of our wastes. The consumption is enormous at best, and the needs on the other side must first be fully met.

These are topsy turvy days. The time was when one who put down a full pork barrel and filled his cellar with provisions was considered wise, while the hand-to-mouth purchaser was looked upon with little respect; today we carry home our sugar in two pound packages and everything else in mere dribs. The builder of houses or the maker of improvements was formerly considered the friend of the community; today he is using the labor needed at the front or behind the lines. But with gasoline or power machinery there is still credit for the progressive man in using so far as actual need demands, for power machinery saves labor. But with our use of power let us not be gas slackers.

DELIVER US FROM EVIL

One minute out of the 24 hours may well be spent in a word of prayer for Old Glory and the boys who are fighting for it on the other side. The congress of the United States has almost unanimously resolved: "That the President is requested to commend by proclamation to the people of the United States observance in their homes and elsewhere, until the end of the war, of the practice of prayer for at least one minute at noon each day to God for victory for our cause in the existing war."

One senator, in opposing the formal adoption of such a resolution, referred to the story of the two little girls who were hurrying to school, fearing that they might be late. One of them thought that it would be a good plan for them to stop, kneel down and pray that they might get there on time; the other suggested that they had better run and pray as they ran. The senator suggested that instead of stopping, that moment be given to speeding up still more the energies of all the people. We are glad the better judgment of the majority prevailed. We will run all the more swiftly for one short moment's respite and appeal for deliverance from the greatest evil which ever threatened this world.

WHEAT 1919

The fall planting for next season's wheat of at least 47,500,000 acres is the desire of the department of agriculture and the food administration. It is estimated that such a planting would result in 670,000,000 bushels of winter wheat. This will be an increase of 12 per cent over last year's planting. A few months ago when it looked as if our Allies would not be well fed, possibly brought almost to starvation point, unless more wheat could be shipped, appeal was made to America to save from her own needed supply. This resulted in 140,000,000 bushels being saved and shipped to Europe. That wheat has been one great factor in the ultimate winning of the war. The same appeal will now be made to American farmers to plant this year 47,000,000 acres.

The 1918 harvest will not yield the hoped for billion bushel crop; in fact, it will be 100,000 bushels short of that, but if the desired acreage of winter wheat for the 1919 crop is planted and reasonably satisfactory weather conditions given, the next crop should even pass the billion bushel mark.

California's production is 513,000 acres minimum, or 538,000 maximum, which is exceedingly small compared to the acreage of Kansas, the great wheat state. She is expected to plant at least 9,479,000 acres, which is 100 per cent of her planting for 1917.

CHANGE OF ADDRESS

"Change the address of my paper to ——," with name signed, is often received by the circulation department of the California Cultivator. Then the circulation manager holds up his hands and looks helpless. Hence, we ask every subscriber who wishes the address of his paper changed to give his old as well as his new address. Thirty-one or thirty-two thousand names cannot be looked over to locate the former address, and no subscription list is made up alphabetically by names, but according to post offices. When we know whether a subscriber lives in Redding, Reedley or Riverside his name can be immediately located.

Pardon us again then for suggesting: "Always give former address."

This Week's War Notes

An oil tanker, the Frederick R. Kellogg, owned by a Los Angeles oil company, has been torpedoed off the Jersey Coast. She was a vessel of 4450 tons.

Pacific Coast cities are enjoying occasional "lightless nights", crowds turning out and enjoying looking at the streets with the usual glare of lights off.

Italian aviators flying over Vienna have dropped leaflets giving neutral press reports of the war situation. Vienna citizens paid as high as 40 crowns for leaflets, notwithstanding severe penalties were possible for simply touching one of the leaflets on the street.

After more than a year of testing out of American trops with both French and English, the American army is now recognized as a part of the defense on the western front by by its being assigned that portion of the battle line south of the Marne from Verdun and running to Alsace.

The British government has issued a declaration formally recognizing the Czecho-Slovaks as an Allied nation, and the three Czecho-Slovak armies are regularly waging warfare against the Central Powers. Allied diplomats in Russia have demanded an explanation of Lenine's threat of a declaration of war against the Allies.

W. R. Hearst has issued an explanation of his several meetings with von Bernstorf and Bolo, denying, however, that he conferred with von Bernstorf and Bolo Pasha in his own home. The attorney-general, however, has issued a statement in which the assertion is made that Hearst entertained both Bolo and von Bernstorf in his home.

Geneva dispatches refer to clamoring mobs on the streets of Munich in which the cry was raised; "Berlin is robbing Bavaria." German papers which chronicled the second battle of the Marne as a Teuton "success" now frankly admit the Picardy defeat has brought a critical situation. The German people are asking more information as to the submarine situation.

Internal revenue collector at New York has been rounding up income tax slackers, securing over a million dollars from delinquents who had failed to report. One payment of $100,000 is reported, but the greater amount was collected from longshoremen and ordinary laborers whose immense wages brought them in the taxpaying class. Ignorance of the law is usually the excuse, but many penalties were assessed.

Submarine activities continue on this side of the Atlantic, three vessels being reported sunk on Tuesday. One of these it is thought was sunk by a wireless controlled torpedo. The officers of the vessel, who were saved, report the torpedo as having passed under the vessel and turned back. Another submarine was reported to have released chemicals on the waters of the incoming tide at Smith Island, North Carolina, which released poisonous gases, overcoming six guards. No fatalities resulted.

Montdidier, Fismes and many smaller towns, some of them important munition centers of the German army, and hundreds of square miles of territory have been captured during the past week. At the present moment the enemy resistance has stiffened, and large numbers of reserves are apparently being brought up. The Allies continue to exert pressure. Peronne, a great German base, ten miles behind the present battle line in Picardy, is observed to be in flames, and it is thought the enemy is destroying great stores which it is impossible to move. Some of the most effective work in Picardy has been performed by British cavalry. Its swiftness in action has resulted in the capture of thousands of prisoners. Each day's reports indicate continuous sifting through of German prisoners, but exact totals are not available. It is thought the northern offensive has at least resulted in the capture of 40,000 German prisoners including 1000 officers, and more than 500 guns. Reports indicate remarkable showing by American aviators along the Vesle front.

The situation in Russia is becoming more complicated nearly every day, and in a way more favorable to the Allies. Amsterdam reports bloody anti-German riots raging in Ukrania and that the Bolsheviki government which was driven from Petrograd to Moscow has now been driven from the latter city. Amsterdam also reports German troops marching toward Petrograd with the apparent intention of discouraging the Allies from their work in the extreme north. The Allies hold on the Murman coast and Archangel has been strengthened. Tokio reports that the Allies have refused to recognize any form of government in Siberia which does not have the full support of the people. London reports large shipment of Red Cross supplies to Vladivostock. British troops, formerly landed at Vladivostock, have proceeded inland to the Usuri River front. They were given enthusiastic reception by the Czecho-Slovak forces. The Allies are ignoring the threat of Lenine that a state of war, especially against Japan, will be declared unless military forces of the Allies are withdrawn from northern Russia. Major General Wm. S. Graves has been designated commanding officer of American forces in Siberia. Philippine troops have been transferred to Siberia.

Early Establishment of Blastophaga in California

By G. P. Rixford, Bureau of Plant Industry

AT THE Fig Institute at Fresno last year my name was put on the program without my knowledge while I was absent on a trip to Washington, D. C. However, I returned a few days before the meeting and attended, but did not have time to prepare a formal paper on the subject assigned to me. The title assigned to Mr. Roeding on the program gave no indication of the subject upon which he addressed the convention. It was devoted largely to the introduction of the blastophaga into California and criticism of the discoveries of Walter T. Swingle and the writer and came upon me so suddenly that I was not prepared at the moment to offer an effective reply.

The article by Mr. Roeding as published in the proceedings of the Fig Institute and in the Cultivator of July 13 states that in all fairness to him, Mr. Roeding, he considers it the duty of Messrs. Swingle and Rixford to present more conclusive evidence than heretofore presented in connection with the early establishment of the fig wasp in this state. It is difficult to understand Mr. Roeding's attitude on this question. If anyone has a right to complain it is Mr. Swingle. If Mr. Roeding's contention is true, then all the credit for the successful introduction of the beneficient insect into this state is due to Mr. Swingle. But Mr. Swingle is a conscientious man and would never claim credit for anything to which he is not entitled. Some of the evidence we have heretofore presented in support of our contention as to the early establishment of the blastophaga in the Gates and other trees has already been published, but as I now have my notes before me and many of the members of the Institute may not be familiar with it, I will present it again with additional particulars which have not been previously printed. Let the reader bear in mind that the insect was first established at Mr. Roeding's place from Mr. Swingle's shipments from Algeria in 1899.

Mr. Swingle and the writer attended the fruit growers' convention at Stockton in December, 1910, and presented a paper entitled, "The First Establishment of the Blastophaga in California." At this meeting we heard that some of the Smyrna fig growers in Stanislaus County were digging up bearing trees on account of the difficulty of securing pollenizing material. After the close of the convention we visited Ceres and by means of the telephone called together as many fig growers (13 in number) as could be reached on short notice. Mr. Swingle addressed the meeting, telling the growers not to dig up any more trees as the United States department of agriculture had leased the Maslin fig orchard at Loomis and would furnish them with capri figs at the bare cost of gathering and boxing. At this meeting we first heard of the old capri fig tree on the ranch of Samuel Gates, ten miles west from Modesto. It was not convenient for us to visit the tree at that time, but the writer did visit it shortly afterwards in company with the Rev. Homer K. Pitman, pastor of the Presbyterian church at Modesto, himself a Smyrna fig grower. We found the old tree to be about 45 feet high with a spread of branches of 40 feet and circumference of trunk of eight feet. At this time it was carrying a good mamme crop. Most of the Gates family were at home and were subjected to a careful questioning regarding the history of the tree and its inhabitants. Mr. Gates being asked how long the tree had carried an overwintering crop, he answered. "Ever since we purchased the place in 1868." The statement was confirmed by Mrs. Gates and their son and daughter, who were present and also afterwards by the other son, then a resident of Alameda.

At this point in the interview, the daughter, Mrs. Green, said, "I am 36 years old and as long ago as I can remember, I tried to get figs I could eat from the old tree and they were all full of these "little winged ants." Returning to Modesto I asked Mr. Pitman what he thought of the statements. He replied: "Those people told the truth."

Soon after this visit Mr. Pitman wrote to Mr. Swingle as follows:

Modesto, Cal., Jan. 26, 1909.

Mr. Walter T. Swingle,
Monterey, Cal.

Dear Sir:

In addition, permit me to give you some more information concerning the Gates capri fig trees. Mrs. Emily Ross, a neighbor of mine, moved to the old town of Tuolumne City in May, 1869. This is about three miles from the Gates Ranch. She lived there two summers, coming back to Modesto in January, 1871. While there she was at the Gates place many times and tried to find edible figs on the capri trees. She is positive in her statement that they were "full of little black winged ants."

This evidence takes us back to a very early date and is to my mind absolutely conclusive.

Sincerely yours,
(Signed) HOMER M. PITMAN.

After some effort Louis Adams who planted the tree in 1867, the year before he sold the place to Mr. Gates, we located. He told the writer that he purchased the old fig tree as well as all his other trees, from the late W. B. West, nurseryman of Stockton. The writer spent considerable time in hunting up old capri trees and found more than 50, nearly all of which were of the Milco variety and almost all were traceable to the nursery of W. B. West.

Two old trees were found three miles from Lathrop, one of them about the size of the Gates tree. I mentioned these trees in reply to strictures by Mr. Roeding at the Fresno meeting. He stated to the convention that he established the wasp on these trees. He had apparently forgotten that he asked me soon after I found them for the names of the owners and their location. If necessary I can name a half dozen old residents of the locality who positively assert that they were unable to find edible figs on the trees because infested with the insects. He also claimed to have established the insect on the seven trees belonging to Mr. Logan, the Stockton photographer. On April 24, 1909, in reply to a question, Mr. Logan told me Mr. Roeding never sent the blastophaga to his trees and that the insects infested them years before he purchased the place in 1903, but said he did not wish the fact published because he had a contract with Mr. Roeding for the figs. The trees were planted by Dennis Crane about the year 1871. The son of Mr. Crane says the insects were in the trees from about the time they were planted. J. F. Joyce, an old settler and neighbor of the Cranes confirmed the statement. At one place in his article, Mr. Roeding says: "Another strange feature in connection with the Gates tree is that Mr. Watkins and others at Ripon have trees which are not much over five miles from the Gates tree, which showed no signs of infestation until colonies of wasps were actually placed in these trees."

I have no doubt that Mr. Roeding placed the wasps in some tree in the vicinity of Ripon, but if it is worth while to continue the controversy, I can produce an affidavit of a prominent fruit grower of the region asserting that the insect was established in some trees in the neighborhood several years before Mr. Roeding introduced them.

About this time the writer was in Stockton and called on Dr. Langdon at the Clark Sanatorium. He told me that Thomas Dorsey, five miles north of Oakdale, had a capri fig tree which had carried the insect for 30 years. I also called at the office of Mr. Peters, son of the late J. D. Peters, a prominent business man of Stockton. It being Saturday, the office was closed, so I called at the residence of his mother, widow of J. D. Peters, an alert and intelligent lady. I found the son had gone to the ranch at Atwater. I stated my errand which was to consult her son as to what he might know about the fig activities of G. N. Milco, who was associated with his father in the buhach business. Mrs. Peters said you may be interested to know that I was one day in the office of my husband, when G. N. Milco came in and showed us a number of figs from which little winged insects were issuing. Milco told us that the Smyrna fig could not be grown without this little bug. I said, Mrs. Peters I am much interested in this incident. Can you tell me the date of this occurrence? She replied she could not tell me exactly, but that the meeting was in Mr. Peters' old office, a year or two before the new building on Channel Street was erected, and added, "When you go out you can see the date of erection on the coping of the new building." A glance at the upper course of granite showed the date of 1888 cut in the stone. Here then is undisputable evidence that the insect had arrived in Stockton 11 or 12 years before it was established at Mr. Roeding's place. Milco was a Dalmatian, well informed on horticultural matters, a promotor of the buhach industry, an importer of fig trees and planted one of the first pistachio nut orchards in Fresno County. His name was attached to the Milco fig by John Rock, according to the old records of the California Nursery Company at Niles, though he did not import it. Mr. Roeding has asserted that the Milco never carries an over-winter crop until it is four years old, and therefore it was impossible that the fig insect could have been brought to California on the trees imported by W. B. West in 1865. The report of this importation by Dr. Gustav Eisen does not state the age or the size of the trees. But there is nothing impossible about it as I know of instances where the Milco has carried through a winter crop on trees the second year from the cutting. I have myself carried mamme capri figs in good condition six months on cuttings, taken from the tree in December.

I have no desire to detract in anyway from the important work Mr. Roeding has done in establishing the Smyrna fig industry in California, but he has demanded proof to sustain our contention and I have here given all that is necessary to convince any reasonable mind.

Growing Milo in Imperial Valley

Written for California Cultivator by J. Paul Hatch

WHEN one takes into consideration the fact that 50 per cent of the acreage planted to milo in California is raised in Imperial Valley, it would naturally appear to be a crop of some importance there. Most any kind of soil, with enough water and a little cultivation, will produce the crop.

There are various methods used. For an early crop some plant in February or March and harvest in July and August, and if they are inclined to be ambitious they cut down the stalks close to ground and remove from field, irrigate and cultivate and raise another crop of grain to harvest in the fall. If the first crop is harvested and the field just irrigated, new side shoots will grow out near the top of old stalks and produce a second crop in the fall, but not as heavy a crop as if the stalks were cut off near ground and a new crop produced in that way. Many farmers plant a winter crop of barley and harvest in the spring, then plow or disk up field and plant, making a fine crop early in the fall. Some follow the practice of burning off the barley straw and stubble fields before preparing the ground for milo, but it is considered a bad thing to do, for the soil is more benefited by the humus produced by working the straw into fertilizer than by the small per cent of ash left after burning.

A good many plow or disk up their fields dry and level, then plant, and irrigate afterwards. Then as soon as milo is up enough to permit working it, they cultivate. Others irrigate their fields first and plow or disk as soon as possible afterwards and plant seed. The most common way of planting is by the two row corn and cotton planters, leaving about 1½ feet space between rows and running lengthwise of lands, yet I have seen a little planting done going crosswise of lands and borders. Many plant their milo on their fields after leveling flat; others, on the ridges between furrows left for irrigation; still others, in the deep trenches left for irrigation. The latter way is no doubt an excellent method to follow when planting late in heat of summer.

When the grain is ripe it is usually harvested by hand labor, cutting off heads with a grape knife and hauling to stacks where it is threshed. Milo in Imperial Valley will produce from one to four tons to the acre in one season, the larger yields of course from the two crops. The dwarf brown milo is the variety mostly raised, but recently a white seeded milo has been produced which is going to prove a winner as well as the brown. Feterita is grown, but not so extensively as milo as it shatters more than milo while handling in the head. All other sorghum grains do well here.

The production of syrup from sweet cane sorghums has just started and will, no doubt, be increased rapidly. A great deal of milo is now put into silos each year and makes excellent silage. One man told me that he threshed more milo last season than he had in all three previous seasons put together.

The price of milo was $66 per ton at close of last season and the prospects for this season's yield are excellent.

Agricultural News Notes of the Pacific Coast

Northern California

Hop picking has begun at Wheatland.

Pleasanton, Alameda County, reports a record grain harvest.

Rice growers of Butte County are suffering from an invasion of ducks.

Shipment of 1100 lambs was made last week from Cloverdale, Sonoma County.

Beginning August 1 all railroad freight shipments must be paid for in advance.

Good yields of wheat, barley and oats are reported hy threshers in Nevada County.

Large tracts of grazing land in Sierra County have been ruined by the army worm.

Grape and hop men have been conferring with Senator Phelan on prohibition legislation.

Work has begun at Orland on permanent buildings to house exhibits of the Glenn County fair.

Employes of the Marysville cannery have all taken the oath of allegiance to the government.

The Alameda County Farm Bureau has taken up the campaign to increase mutton and wool production.

The Pacific Coast Land and Industrial Exposition is planning for a big show at Oakland September 9.

The Northern California Counties' Association will meet at Weaverville, Trinity County, September 9-11.

Residents of Sacramento are appealing to the food administration for relief from the advanced retail price of milk.

The Humboldt County Dairymen's Association held its fifth annual picnic at Loleta on the last Saturday in July.

Grass Valley, Nevada County, is shipping out Bartlett pears to Eastern markets, about one carload a day going forward.

A large detachment of men from the Mare Island navy yard will be encamped on the fair grounds at Sacramento throughout the fair.

The big new cannery at Martinez, Contra Costa County, is now ready for operation. It will handle 30 tons of tomatoes in nine hours.

The management of the Humboldt County fair is trying to secure the Allied War Exhibit for the fair to be held at Ferndale August 20-24.

The olive growers of Placer County met at the Lincoln cannery on August 10 to discuss measures for securing processing of olives within county.

Butte County reports its rice crop as looking exceptionally well and if water shortage does not become too serious maximum crop will be produced.

Placer County olive growers will meet at the cannery at Lincoln, Saturday of this week to discuss processing at home the olives grown in that county.

A fruit packing school was conducted the first week in August by the Nevada County farm bureau. There were 50 attendants. The sessions were held at Grass Valley.

The prune growers and fruit packers of Sonoma County met at Healdsburg recently to discuss the labor problem. After considerable discussion it was decided to set the price for gathering prunes at $4.00 per ton.

Central California

Tulare County expects a heavy prune crop.

The coming raisin crop is estimated at 180,000 tons.

San Jose canners are paying $20 a ton for tomatoes.

Tulare County is fumigating its citrus groves for soft gray scale.

Oakdale, Stanislaus County, is harvesting its higgest crop of wheat.

Atwater, Merced County, shipped its first carload of peaches to Canada.

The Valley shows over 15,000 acres of alfalfa signed up with the new association.

Woodlake, Tulare County, expects to send out two carloads of grapes a day until October.

Mt. Whitney Light and Power Company is appealing for increased electric power rates.

Western Fresno County is finding poor success in getting laborers to stay in harvest fields.

Inspectors in Fresno County have condemned several cars of table grapes picked too green.

Possible jobs in raisin picking is bringing large numbers of families into the San Joaquin Valley.

Farm Adviser Washburn of Santa Cruz County is urging farmers to put a few sheep on their places.

More careful estimates of citrus groves of Tulare County indicate not far from 50 per cent output.

The Corcoran farm bureau auction sale of fat hogs resulted in prices ranging from $14.25 to $15.75.

Three cents per tray for picking Muscats is the wage fixed by the Valley Fruit Growers' Association.

Apple men predict that the opening of the Watsonville apple season will be about two weeks later than usual.

Turlock district of Stanislaus County is showing some damage to watermelon crop from nematodes and wilt.

Watsonville, Santa Cruz County, is shipping seven or eight cars of fresh fruit daily, principally apricots and berries.

Alfalfa growers of Central California are discussing community warehouses in the principal hay growing districts.

The California Associated Raisin Company warns growers that high quality raisins can not be dried on dirty trays.

Grape growers who wish wire for grape vine trellis are compelled to sign affidavits as to purpose for which wire is to be used.

Central and Coast counties cattlemen recently met at Salinas and 100 members were added to the California State Cattlemen's Association.

Owing to shortage of water the condition of tomato crops in the Santa Clara Valley is critical. Because of the large acreage planted the yield will probably be equal to last year's.

Grain growers of the valley are complaining to the food administration that the poor quality of sacks furnished them is causing much loss of grain.

Many new members have been added to the California Alfalfa Growers' Association and the San Joaquin Valley Milk Producers' Association by the recent campaign in Merced County.

Southern California

October 4 will he Santa Barbara day at the Ventura County fair.

Summer blight and root knot of tomatoes are prevalent in many sections.

One acre of early grapes in the Coachella Valley netted this year $499.50.

The Palo Verde Valley, Riverside County, is now assured a cotton seed oil mill.

The Camarillo farm bureau has decided on a $3.00 a day wage for bean harvesters.

Some damage is reported to Lima bean crop in Orange County from the recent hot weather.

The California Lima Bean Growers' Association is now handling other varieties of beans.

Palo Verde Valley will hold a rodeo sometime early in November. It will be a three day event.

The Orange County Fruit Exchange estimates the coming year's citrus crop worth $5,000,000.

The Lankershim Laconic announces practically all dried apricots in that section sold at $80 a ton.

Ventura County walnut and bean growers are combining to secure adequate help in harvesting.

Estimates place the walnut crop of the Lankershim district of Los Angeles County at 125 tons.

Orange County reports some Blackeyes already ripe and Limas ready to cut within a week or two.

A new lemon growers' exchange is being organized in Ventura County with packing house at Hueneme.

Several high schools throughout the state are adding courses in tractor management to their curriculums.

The Coachella Date Growers' Association has rented a packing house and will take care of dates of members.

Bean growers of Sawtelle and Inglewood are discussing advisability of joining the Lima Bean Growers' Association.

The date growers of Coachella Valley met recently and discussed the advisability of estahlishing a central date packing house.

Federal farm help specialists are investigating as to the labor situation in the cotton fields of Imperial and Riverside Counties.

Cotton growers in the Palo Verde Valley in Riverside County are planning to establish a cooperative cotton seed oil mill at Blythe.

The Colorado River has resumed normal flow, and the Imperial Valley irrigators have suffered less from water shortage than last year.

The South Coast Honey Producers' Exchange has been incorporated by bee men of Ventura County. It will cooperate with the California Honey Producers' Exchange.

The La Habra farm center recently was favored with lantern slide lecture by Prof. Quayle of the citrus experiment station, "Citrus Culture in the Mediterranean Countries, Illustrated."

An infestation of grasshoppers which appeared at Summit in San Bernardino County was summarily dealt with by the county farm bureaus. The infested areas were sprayed with burning distillate.

The Coast and General

Rains last week in Arizona will help out the range feed.

Northern Arizona reports range cattle in splendid condition.

Oregon's pear harvest is beginning two weeks earlier than usual.

Yields of barley and oats in Oregon are not up to expectation.

Australia has only one beet sugar factory; it is located in Victoria.

Utah and Nevada stock ranges are showing the effect of the dry weather.

The Red Cross is providing for relief of destitute Greeks in the Saloniki section.

Picking of short staple cotton will begin in Yuma County, Arizona, the first of September.

The government has taken over all telephone and telegraph systems in the United States.

Glendale, Arizona, has shipped out 838 carloads of cantaloupes this season. Mesa shipped 335 cars.

Secretary MacAdoo announces that the Fourth Liherty Loan campaign will commence Septemher 28.

New Mexico has prospects for a very large cantaloupe crop. The first carload was sent from Las Cruces on August 2.

Florida growers state that they are now paying 30 cents apiece for orange crates that formerly sold for 11 and 12 cents.

British Columhia reports unusually heavy June drop of apples, which resulted in part at least from severe frost on May 24.

Hutchinson County, Kansas, has organized a dandelion campaign and is paying 50 cents per bushel for dandelion tops and roots.

The United States government is encouraging cleaner beans and has taken over supervision of some of the plants in California.

Canyon County, Idaho, will produce over 2,000,000 bushels of wheat this year, which is vastly over production of any preceding year.

Nevada reports "Irrigation water getting low; grains have passed danger point; wheat, harley and rye ripening in fine condition."

Walla Walla, Washington, has shipped ahout half its onion crop, which is 15 per cent under normal. The total crop is estimated at 200 carloads.

An association has been formed in Spain, known as the Spanish-American Wool Association, which proposes to deal largely in wools of Argentina.

Washington, Oregon and Northern Idaho report a general rainfall near the end of July which saved the crops and reduced the temperature of a severe hot spell.

Kansas farmers have been urging larger planting of barley and have turned their farms in part over to tenants on shares, seed furnished, one-fourth of crop returned.

Several plants for the manufacture of dried milk have been established in New Zealand. It is claimed that it is very much more profitahle than either butter or cheese making.

At the recent meeting in Seattle of various cranberry growing associations crop estimates indicated that the 1918 yield would be at least double that of 1917. Growers expect to start picking about September 1.

Horse a Factor in Tent Pulling in Fumigation

By R. S. Woglum and E. L. Prizer,
U. S. Department of Agriculture

THE covering of trees with tents in orchard fumigation forms the most laborious part of this strenuous practice. In the earliest days of fumigation in California cumbersome apparatus mounted on wagons was employed for tenting large trees, and the treatment of a few trees a night was considered satisfactory. With the advent of the sheet tent tree covering was greatly simplified, and the perfection attained through years of experience has developed outfits which have been known to handle 60 tents in 45 minutes, although an hour is the usual duration for throwing an entire set.

The manipulation of small tents during dry weather is accomplished without great effort, but operations conducted with 18 and 20 foot poles on large trees during humid weather are a constant heavy strain on the tent pullers. In fact two tent pullers can manipulate tents up to 41 or 43 foot sizes without much difficulty during dry weather or even 45 foot tents on small trees. The covering of trees requiring 45 to 54 foot tents usually necessitates the use of four, and under humid conditions which render the cloth damp sometimes, six tent-pullers. This large number of men on an outfit greatly increases the cost of operation and therefore is a feature in itself of considerable importance, especially where competition occurs. Furthermore, fumigation of trees that are difficult to cover presents an even more important consideration at the present time in its effect on retaining tent pullers.

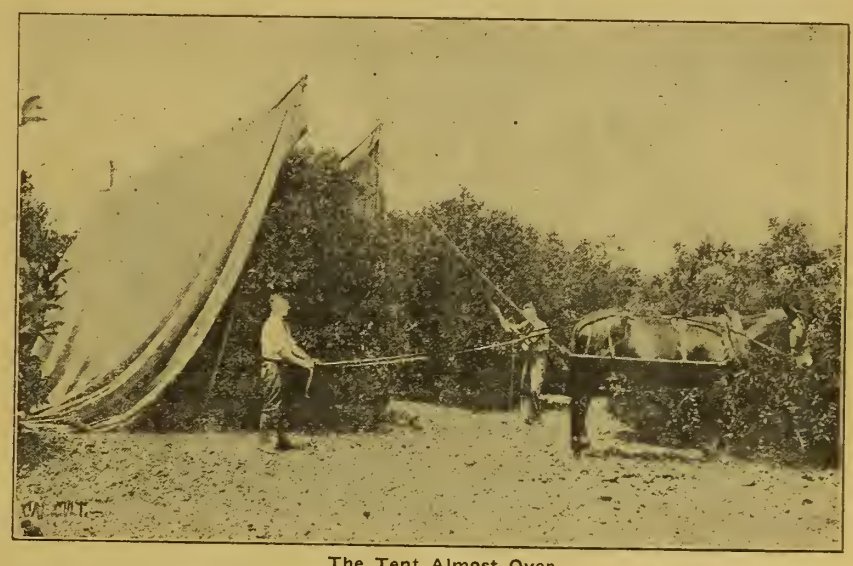
Saving Man-power in Fumigation
Starting to raise the tent.

The manipulation of large tents with long poles over a period of 8 to 12 hours is no easy task even with four seasoned tent pullers and dry tents. On nights of continued high humidity which renders the cloth damp, the greatly increased weight of the tents and friction with the tree renders the operation exceedingly laborious. Unseasoned men frequently either can not or will not endure the strain, and the result is changes in personnel at inopportune times. In a practice of limited season, of high operating cost and affected by weather conditions, as is fumigation, it is essential that the outfit keep operating continually during favorable weather. The quitting of a tent puller or two might tie up the whole outfit, and its recurrence result in demoralization of the entire crew. At the present time of labor scarcity, especially of men of powerful physique, suggestions that offer even partial relief in lightening the burden of tent pulling and thereby continuing the employment of a crew throughout the season should prove of value.

Max Thoma, of the San Diego Land Corporation, after experiencing difficulty last season in retaining fumigation labor, worked out a method of utilizing horsepower to assist in throwing fumigation tents. The apparent success of this new method at Chula Vista during the past season and its possible value to fumigators generally during the present period of labor shortage has led the writers to exploit this innovation in order to familiarize others with the details of its operation. Accordingly a harness has been constructed after the same general pattern as that used by Mr. Thoma, but modified in a few details, and practice tests in tent pulling by horsepower have been conducted at Alhambra and Whittier. Demonstrations are now being given before fumigators in other districts.

The harness and steps in operation are produced in the accompanying photographs. As practiced with 16 foot poles, one man drives the horse and directs the pole which is operated by a rope running from the top to a ring on the iron breeching. A tent puller manipulates the other pole. When both poles are raised at an angle sufficient for the points to stick into the ground the horse starts pulling, and thereafter the main effort of the puller is to direct the tent. After some experience tree covering should be accomplished easily and accurately. The covering of trees with 20 foot poles requires more than two men.

A horse of quiet disposition is best suited to this procedure, and with proper training such an animal should require little guiding. The fact that fumigation is slowed up slightly while the crew and horse are learning the method may deter some from trying it. In this respect a notable feature to consider is that its economic value even for medium sized trees has already been proven by an experienced fumigator. Furthermore, horse power for covering large trees during the early morning hours is sure to be appreciated by most tent pullers.



The Tent Almost Over

The Grange as an Educational Factor

Written for California Cultivator by Frank L. Hunt,
Master California State Grange

THERE never has been a time in the history of the nation when organization was needed among our farmers more than now. Everyone recognizes the absolute necessity of the farmers getting together and staying together if they expect to maintain their rightful position in the face of so many other organizations and combinations as they are brought in contact with at every turn. No class of people recognize this fact more fully than those that make up the membership of the Grange; and it is because of this recognition that the Grange has for over a half century been using its best endeavors to instill the idea in the minds of the farmers generally.

To one who is in constant association with this great order and thereby recognizes its value, it seems almost incredible that comparatively so few of our farmers realize what the organization has been doing and is doing along these lines. Perhaps this can be accounted for in California, to some extent at least, from the fact that the Grange is so much stronger and is getting so much greater results in the Eastern states than it is in this state, that those not in close touch with the work fail to recognize its value.

With this thought in mind it might not come amiss to call attention to this great organization from three different standpoints; namely, the Grange as a big educational concern, the Grange as a big legislative concern and the Grange as a big business concern. In order to consider the Grange along these lines, it will be necessary to divide this article into different sections and even then deal with the subject only in a very limited way.

First, consider the Grange as an educational factor from a numerical standpoint. When I say that the Grange has nearly a million members and that these members are scattered over 33 states of the Union, please remember that this membership applies with just as great force along legislative and business lines as it does along educational lines.

Everywhere in our ritualistic work and always in our meetings, one of the first thoughts that is given us is the motto that we have stood for for so many years: educate and elevate the American farmer. We believe now as we have always believed, that farming will never be what it was intended to be till the farmer is educated. To be a really successful farmer, just as good an education is required as to teach school or as is needed for any other profession. Indeed the education that it requires to be the right kind of a farmer must be broader and deeper than that for a school teacher, because the teacher is only expected to teach along certain lines while the farmer should have a knowledge along many lines. He must be a good business man and he must be able to adapt himself to everchanging conditions. No two seasons are alike in California. Farming one year must be done very differently from the way it can be done the next year. So the farmer must be able to judge these different conditions and work his farm according to the season. But I must not pursue this line of thought further.

One of the Grange's greatest achievments along the educational line was accomplished when the department of agriculture was established. It is not generally known that it was through the direct influence of the Grange that the department of agriculture was brought into existence and placed on a level with the other cabinet offices. Consider what a great influence this office has had and is having on the agricultural situation of the United States. Think of all the experiment stations, of the attention that is being paid to agriculture in our colleges,

Fruit Inspection Situation

SOME shippers have seemed to throw the fruit standardization regulations to the winds and have dumped immense quantities of low grade fruit on the market, especially in San Francisco. The state horticultural commission and several of the county commissions have taken a hand and in a measure at least have secured cooperation on the part of grower and shipper. The state horticultural commission says:

There is a certain element of packers and shippers who simply cannot be brought to recognize their responsibility except by drastic methods. California cannot allow the reputation which has been built up by great effort to be dragged down by this element. If condemnation is the only means which will bring home to them a sense of their obligations, it then becomes necessary to proceed in this manner. Fruit packers who expect the state to stand back of their products must be prepared to make an honest endeavor to pack in accordance with regulations. The better element both among independent growers and the associations is behind any movement for better fruit, and this office is in receipt of sufficient representations to this effect to know just how things stand in this regard. As an example the following letter signed by Frank Swett, manager of the Pear Growers' Association, is quoted:

"This morning the wharf is piled up with inferior pears, many of which are unfit for human consumption, and sacrifices will have to be made for moving the accumulation.

"A close examination of the thousands of boxes on hand show that the growers, or their tenants, have been putting everything in the way of windfalls and wormy pears into the boxes, mixed in with the good windfalls, and with the good No. 2 pears. This morning I personally inspected every shipment on the wharves.

"How does it work out? Last week when only 300 to 400 boxes a day were coming in, the retailers bought such pears, took them to their stores or peddling wagons, sorted them over, threw away the wilted, the wormy and the rotting pears, and laid aside the good 50 per cent of the pears to ripen up. They bought because there was nothing else to buy.

"Now they have enough for their immediate wants, and will not buy the mixtures of trash and good pears. Over 2000 boxes a day are coming in. Therefore, the grower, if he permits his help to do as they have been accustomed to do for years, and throw into the boxes all the refuse pears is bound to lose.

"The growers on the river will save, on the estimated tonnage of 3000 tons of windfalls, if they will sort them over and send only the good ones down to this market, at least $7000. What's the use of paying charges and using boxes to transport something to market that not only brings you nothing, but costs you $5.00 to $7.00 a ton loss?

"Let's all get busy in providing a better grade of windfalls and No. 2 pears for this market. Consumers will buy them at a good price if the rotten, wilted and wormy trash can be kept out of the boxes. Consumers will be better off and the growers will get a decent return for respectable fruit.

"If this association can succeed in raising the standard of the windfall and No. 2 shipments so that purchasers are not afraid to buy, it will have performed a service to the growers and the general public that is well worth while.

"Talk it over with your neighbors, and show your own help that everybody all along the line loses when good and bad fruit are shipped in the same boxes."

Deputy State Commissioner Weldon, accompanied by commissioners from several counties around the bay, recently made a two day inspection of conditions in the San Francisco market. Several thousand boxes of pears were condemned; apples were found to be in much better condition; tomatoes were in exceedingly poor condition, as were strawberries, peaches and other fruits. The same general condition obtained in Oakland.

Florida Free of Citrus Canker

FLORIDA has been freed from the terrible citrus canker after three years of strenuous fighting. The Cultivator has given in detail the methods used in eradication; isolation of groves, burning of all infected trees, root and branch, drastic disinfection of all tools and clothing entering infected groves, etc.

The work was done by federal and state authorities working in cooperation. The federal bureau of plant industry now announces that the campaign has been successful in Florida—it is free of citrus canker.

In the other states concerned the work is somewhat complicated by the rather general practice of mixed plantings of susceptible and somewhat resistant types of citrus trees. In South Carolina, however, it has progressed so satisfactorily that it is unlikely that further work will be required during the coming year, while in Alabama, Texas, Louisiana, Mississippi and Georgia a longer time will undoubtedly be necessary.

The citrus canker campaign is unique in character, in that it is the first instance of the use of federal funds appropriated specifically for the eradication of a plant disease. It is of overwhelming importance to the citrus industry, because citrus canker has been recognized as the most contagious of all known plant diseases and the most destructive of commercial values.

When the disease was first recognized as a new one, an immediate and rapid inspection of the Gulf region by an agent of the federal horticultural board of the United States department of agriculture, supplemented by reports from state officials, indicated the occurrence of infected citrus trees in more or less widely separated and sharply defined localities from Southeastern Florida to Southern Texas.

In outlining plans for the eradication of citrus canker emphasis has been placed upon the magnitude of the undertaking because of the extreme infectiousness of the disease and the wide area throughout which it has been disseminated. Owners of citrus groves were advised that whenever symptoms indicating this disease appeared, they should take all possible precautions to avoid its spread, prohibit all visiting to the grove affected or those adjacent, stop all cultivating or other work, and send for a state specialist to determine definitely the disease.

The cooperative work of inspecting citrus groves and nurseries and destroying infected trees was begun in Florida immediately upon the approval of the urgent deficiency act of January 25, 1915, and shortly afterwards cooperative agreements for similar work were made with Alabama, Texas, Louisiana, Mississippi, Georgia and South Carolina.

ASSOCIATION GIVES NOTICE TO PACKERS

The California Prune and Apricot Growers' Association is calling attention of packers to a ruling of the food administration which provides that before soliciting contracts for the sale of food products an agent must first ascertain whether or not the grower has previously contracted for the sale of his fruit to any other person. Since a number of the packing institutions have attempted the purchase of fruit from our members, even with a full knowledge of their membership, the association has recently furnished all packers with formal notice of the above rule. As the violation of this rule might lead to revocation of their food administration licenses, several growers have recently reported their desire to sell green fruit to other than association members.

All growers should understand that in case of any sale of green fruit the association will not furnish a regular approval except in case of sales to members, or for legitimate green shipping or canning purposes. If the grower is going to sell to anyone without the association, he must protect himself and insure the fulfillment of his contract with the association by placing the responsibility of said contract on the purchaser. In case of any failure to deliver, the association will be holding the grower responsible, and he can only clear himself by in turn properly and legally holding purchaser responsible.

AVOCADO PROSPECTS GOOD

Avocado prospects, according to report in the Los Angeles County Farm Bureau Monthly for August, are good. The report says:

"Last year was a very bad one for the avocado grower for, in common with citrus trees, the crop quite largely fell off as a result of the heat wave. In addition, severe burning occurred on many of the avocado trees. However, as was the case with citrus. avocado trees bloomed very heavily this season and set a heavy crop. Although a considerable fall of fruits is now occurring, worse in some sections than in others, the prospects are for the largest crop ever. For the first time probably, there will be enough fruit on the local market this fall to make a showing. Quite a number of Fuerte and Puebla trees will come into bearing this season and the indications are that the Knight varieties will show their fruiting quality for the first time."

SCALY BARK DEMONSTRATION

On August 27 the Monrovia-Arcadia center will have a scaly bark demonstration conducted by Assistant Farm Adviser Hodgson. Demonstration will be given in the groves of J. W. Blain and Director Petersen.

From reports received at the office of the state horticultural commission, it would seem that a considerable portion of the orange crop in the Sacramento Valley has dropped as a result of the hot wave in June. In some cases it has been definitely stated that the loss from this cause will run as high as 90 per cent.

New Grading of Nursery Trees

At a recent meeting of representative nurserymen of the state at San Francisco, there came up for consideration the matter of grading trees by caliper specifications instead of by tree length. Two years ago the nurserymen adopted specifications of four to six foot, three to four foot and two to three foot lengths, each length with minimum specified caliper. According to these specifications the length was the determining factor and was given the precedence, but, as a matter of fact, in determining the grade of a tree, the caliper, stockiness and root development are of greater importance than the length of the tree and should be given the precedence over length in determining the grade of the tree, so in order to adopt specifications that would determine more clearly the true grade of the tree, they deemed it advisable to give the caliper specifications the precedence, while the length of the tree is a secondary consideration. To that end the nurserymen adopted the following schedule of grades:

On all varieties of deciduous fruit trees consisting of apples, apricots, cherries, chestnuts, peaches, pears, pecans, plums, nectarines, quinces and walnuts, the caliper and height combined will determine the grade of the tree, the caliper always taking precedence. The following schedule of caliper and sizes effective on the varieties named:

Caliper not less than one inch on eight to ten foot trees.

Caliper not less than three-fourths inch on six to eight foot trees.

Caliper not less than one-half inch on four to six foot trees.

Caliper not less than three-eighths inch on three to four foot trees.

Caliper not less than one-fourth inch on two to three foot trees.

On almonds and figs, because of their inclination to grow stocky, the caliper measurement will govern the grade of the tree, regardless of height, and the following is the schedule adopted:

Almonds

Caliper not less than one-half inch represents four to six foot trees.

Caliper not less than three-eighths inch represents three to four foot trees.

Caliper not less than one-fourth inch represents two to three foot trees.

Figs

Caliper not less than five-eighths inch represents four to six foot trees.

Caliper not less than one-half inch represents three to four foot trees.

Caliper not less than three-eighths inch represents two to three foot trees.

This action on the part of the representative nurserymen of the state should overcome the irregularity of determining the grade of a tree by length, and the above schedules will more nearly determine the true character and grade of the tree and will work to the advantage of both the planter and the nurserymen.

Nitrate Delivered to Eastern Farmers

Despite the shortage of ships and two shipwrecks, farmers received 75,000 tons of nitrate of soda from Chile, bought through the war industries board and distributed by the United States department of agriculture.

The nitrate was sold and delivered under authority of the food control act which authorized the president to procure and sell nitrate of soda at cost for the purpose of increasing food production, and appropriated $10,000,000 for this purpose. The war industries board was designated by the president to make arrangements for the purchase of the nitrate and the secretary of agriculture was charged with its sale and distribution. The nitrate was sold at $75.50 a ton at Eastern ports, its cost as nearly as it could be determined in advance. Applications for more than 120,000 tons, the total amount purchased in Chile, were received by the department in February, 1918. On account of shortage of available shipping it was possible to bring in only 75,000 tons, leaving on hand in Chile between 35,000 and 40,000 tons. Ships have just been assigned by the shipping board for the transportation to this country of the remainder of the nitrate contracted for last year which, of course, can not be used this season.

No announcement can be made at this time as to whether nitrate will be offered for sale to farmers next year. The question of procuring nitrate for agricultural purposes is closely connected with the demand for nitrate for munitions and with the availability of tonnage for bringing in the nitrate. It has been intimated to the department by the war industrial board and the war department that the need for nitrate for munitions is such that it is doubtful whether it will be possible to import any next year for use as fertilizer.

Tractor Demonstration

For five days, commencing Saturday, September 17, there will be a big tractor demonstration held on the Whittier boulevard one-half mile east of the Los Angeles city limits. And a tractor demonstration draws a crowd like a movie outfit taking pictures. The crowd doesn't come out of curiosity either; it comes because it is vitally interested in tractors and the work that tractors are doing and can do for them. From the giant field type to the orchard tractor that can make a sharp turn under an orchard tree, they will all be there in force, plowing and cultivating on a big tract where everybody can see just how they act under practical conditions. More than 40 types of tractors will be exhibited, with attendants to explain and demonstrate for the full five days.

Also there will be many huge tents containing display of implements, trucks and accessories. There is always something new in this line, something a little better, more economical and more practical. Produce and conserve are the watchwords in every endeavor during these strenuous days, and in no way can one better put them into practical demonstration than by employing up-to-date labor savers — and that is what the modern tractor and implements are.

There are now more than 100,000 tractors in use on farms of the United States; thousands have been sent from our factories to the fields of England and France to serve, as the tractors in this country are serving, in the second line of defense, on the farms that send up food to the front line where the fighting is being done, while supplying food to all the forces which stand behind.

Never did the tractor mean so much to the world at large; never did it mean so much to you personally. Then be sure to see the demonstration this coming week near Los Angeles. It is in charge of the California Tractor Engine and Implement Dealers' Association. Ten thousand automobiles can be parked inside the demonstration field, free parking, of course. Admission to the grounds is also absolutely free. Remember the dates, September 17-21, and come early.

FARMERS CALLED TOGETHER

Victory must come from the soil. Food and men will win the war. The soil supplies both.

The federal board of farm organizations hereby calls upon the farmers of the United States to assemble in person or by their representatives, in the city of Washington, August 27, 28 and 29, 1918, there to take such action as will best promote the production of farm crops in 1919: sufficient, first, to supply our own people, our allies and the neutrals who depend upon us, and, second, to replenish our national reserves of grain, live stock and dairy products, now depleted to a point where a single short crop will threaten us with famine.

America's acres can and must win the war.

USE PAPER TRAYS FIRST

The following bit of sensible advice is passed on to growers by the Raisin Association:

Many growers who have not sufficient trays for their needs start picking on wooden trays, sometimes in the hope that there may be enough to go around. If a grower thinks he has not enough wooden trays for his crop he should make arrangements, if possible, to buy or rent some more. If this isn't possible he should get paper trays without delay and pick the first grapes — not the last — on paper, so that there will be the minimum of danger from the rain.

$1,000,000 FOR FIGHTING FOREST FIRES

The president has authorized the loan of one million dollars to the forest service for fire fighting expenses. The loan became effective on July 27, and was made from the special emergency fund placed in his hands by congress. The necessity for this action, according to the forester, was made imperative by the unusual severity of the present fire season, coupled with the fact that congress had adjourned without passing the regular agricultural appropriation bill.

BELGIUM

Belgium, the land of von Mons, and the Abbe Hardenpont, those great fruit raisers of a hundred years ago; the land of fruit and horticulture before the war, is indeed now a land of devastation and desolation. In a letter telling of his experiences there, P. Val Kerr, a well known orchardist of Tyabb, Victoria, and formerly assistant at the School of Horticulture, Burnley, says in the Fruit World of Australasia: "I have seen a good deal of Belgium (far too much in some ways), but I can't say that I've seen much of Belgian horticulture. All I've seen of that country is barren, desolate, shell-torn country — a terrible sight when one thinks of its late position in the horticultural world."

The man who refuses to do an honest day's work for an honest day's pay, especially in war time, is a traitor to his country. The man who only makes a bluff at working is worse than the ordinary vagrant, for the latter doesn't collect any pay for doing nothing.

To secure quicker and more even curing of the raisins, the trays should be sloped toward the south to receive more directly the rays of the sun.

Soldiers of the Soil

Like his brother in the Army or Navy, the Soldier of the Soil needs proper body-building nourishment.
When its warm, and he craves a cool refreshing beverage, what could be more satisfying than a glass of good iced coffee? *JEVNE'S "35"* has just that touch of goodness that refreshes and gladdens.

Truck Crop Production in the Delta of the San Joaquin and Sacramento

By R. G. Risser, Assistant Truck Crop Specialist

CROP production in the reclaimed lands of the delta of the San Joaquin and Sacramento Rivers of California is not confined to a few crops or a single type of farming. Beans, corn, potatoes, barley, oats, hemp, vegetable seed crops, pears, and other crops are important products of this productive district. At the same time it is one of the most extensive producers of certain kinds of truck crops in the United States. In the peaty soils of the San Joaquin reclamations one of America's leading onion districts is located. In the slightly heavier solls on these rivers one of the foremost celery districts has been established, and on the sediment soils of the Sacramento River the largest asparagus district in the United States is to be found. The onion crop is used largely for storage and partially for shlpment and immediate consumption. The celery crop is used for winter shipment. The asparagus crop is used principally for canning but also for shipment to Eastern markets in the fresh state and in a limited way for Pacific Coast consumption. In a practical combination of intensive methods of farming these truck crops are grown with good yields and the work is done on a large scale. Various means of reducing the labor cost have been put into general operation. Plowing with large traction outfits ls extensively done. Ditching with machines especially designed for this district is generally practiced. Drainage by large electrically operated pumps is the rule, and hauling by river barges and steam boats is the customary means of transportation. Yet labor is the factor which is the limiting element in the truck crop industry of this district under present conditions. No machines have been found adapted to the weeding of onions, the weeding and transplanting of celery, or the field cutting of asparagus. The work must continue to be done by hand labor unless some genius can devise a successful substitute, and no such possibility seems feasible just now. The labor situation in this district has been growing more serious every year in the past few years until it has reached a stage which is extremely critical. Wages have been advanced frequently, all kinds of concessions have been made to workers and employers have been compelled to accept any kind of workmanship available regardless of efficiency and without remonstrance of any kind. The shortage of satisfactory labor in thls district has, lndeed, been so acute that it has discouraged the farmers and is resulting in a change of policy regarding farming systems. The loss of asparagus due to cutters, the waste which occurred in the canneries and the loss in quality through improper handling was excessive. The reduction in the acreage of celery has been another result, and the abandonment of weedy onion fields was also caused by the labor situation. Last season there was difficulty also in handling the onion crop and the general movement occurred late, but the unusually late fall with weather hlghly favorable for harvest cannot be expected this year again, and the prospects of handling the crop is in doubt. Wages are not the only question, although they have multiplied productlon costs and cut profits to a doubtful margin, but there is so much independence that workers will not accept instruction, not to mention discipline. In splte of these labor difficulties the celery transplanting has proceeded in prompt fashion.

Field setting of the reduced acreage is well under way and will be finished by August first, which is slightly ahead of normal. The acreage for the delta districts of the counties is as follows: Contra Costa County, 1916-7, 1605; 1917-8, 2075; 1918-9, 1100. Sacramento County, 1916-7, 995; 1917-8, 967; 1918-9, 805. San Joaquin County, 1916-7, 655; 1917-8, 840; 1918-9, 165. Total for 1916-7, 3255; 1917-8, 3882; 1918-9, 2070.

The average yields of stock shipped in the past three seasons as shown by records of extensive areas was as follows: 1915-6, 130 crates; 1916-7, 79 crates; 1917-8, 134 crates.

If the entire acreage had been acceptable for shipment under existing market and transportation conditions the yield would have been slightly higher as some of the less desirable stock remained in the field at the end of the season. However, the season was highly satisfactory from the view point of ylelds as there were no severe freezes like the ones which occurred the previous year. With a larger acreage than ever before and an exceedingly mild winter, the production broke all records. It was only from the vlewpoint of returns that the situation was not entirely satisfactory. Retarded movement of the cars East caused by terminal congestion and other transportation difficulties resulted in deterioration of the product in transit and poor condition upon arrival. The quality of the pro duct was impaired and the market demand was weaker than usual. Altogether conditions were decidedly unfavorable for high prices. The first car of celery is usually shipped from the Delta district the middle or latter part of October, the first car last year going out on October 22. Heavy shipments East are made early ln November for the Thanksgiving trade and December shipments are also heavy. The first part of the season the stock is tall and heavy. Foliage is green and the product has good carrying quality. Sizes usually run large. During the latter part of the season production is more uncertain and sizes are smaller, but these things depend upon weather conditions and are materially affected by repeated freezes. The regular load was formerly 160 crates per car, but as the season advanced the load was increased to 180 crates. Somewhat heavier loading is now practiced throughout the season and it is estimated that the average number of crates per car is 175. These crates have a base of 22 by 24 inches. The helght ls 18, 20, 22 or 24 inches, accordlng to the length of the celery. The average height is probably 20 inches. The varlety used is Golden Self Blanching, which is blanched and partially protected from freezes by being banked with soil. The largest shipping points are Antloch and Walnut Grove. The acreage of onions in the Delta is estimated as follows: San Joaquln County, 1917, 5935; 1918, 7765. Contra Costa County, 1917, 2133; 1918, 1439. Total, 1917, 8068; 1918, 9204.

Much of the product of last year's acreage was shipped to the cities in boats and stored in warehouses where there was loss from deterioration. Much was grown for seedmen who used the bulbs for planting. For this reason railroad records are not a true criterion of production in this district. The average yield varies with seasons, usually runnlng close to 225 to 250 sacks per acre, each sack weighlng 105 pounds. Shipments are made in cars, the usual load formerly being 300 sacks. Since provisions have been made for heavier loading, the average probably runs closer to 375 sacks per car. The main varieties are Australian Brown and Buck Skin, but other varieties are also grown particularly for the seedmen. A later report will be made of the onion outlook and asparagus production will be considered separately.

Tomato Blight

WE HAVE a recollection of havlng seen a publication, we think issued by the United States department of agriculture, in which method of treating summer blight, or wilt, of tomatoes through the soil was given. More specifically, if we remember rightly, sulphate of copper was used in varying degrees of strength, some showing no effect; stronger, slight effect in preventing disease; still stronger, death of the plant. The idea of the treatment was that fusarium present in the soil was destroyed before it secured entrance into the plant. However, regardless of our recollection of this bulletin, we have the following from a subscrlber at Potrero, San Diego County:

I noticed an article in the July 20th number from Subscriber, Redlands, asking what to do for tomato blight. I will tell what we have learned from experience. Take one heaping tablespoon of bluestone; dissolve in six quarts of water. Make a ring, say three inches deep and four or five inches from plant around root and fill in with solution and when soaked into ground cover with soil. If not too far gone plants will recover.

I have treated healthy plants ln this manner and have not lost any after they were treated. I do not measure the bluestone but I think that is about the right proportion.

I once tried putting the bluestone around without being dissolved. I scattered a good quantity around roots and then irrigated them. It had a queer effect on the vines. There would be a streak on one side of vines from ground to almost top and on some of the branches that looked like a frost had struck it. However, my vines did not die and I lost no more from blight. We have raised tomatoes on the same ground for years, only moving them a few feet each year, without a case of blight for years. Before we learned about the bluestone we were greatly troubled, some years losing almost all our vines. Care should be taken not to have the solution too strong.—E. R. M.

AUGUST SCHEDULE OF GLENN COUNTY FARM BUREAU

Twelfth, Willows, nlght meetlng; 13 and 14, Orland, night meetlng; 15 and 16, Plaza, night meetlng; 21, Chrome, nlght meeting; 23, Larkin, night meeting; 24, dlrectors' meeting at Willows at 10 a. m.; 28, Elk Creek, day meeting, 2 p. m.; Grapevine, night meeting.

Tomato Troubles

Every year at this time the mail brings to the Cultivator office many queries as to what to do to save tomato plants that show signs of dying out. Unfortunately there isn't much that can be done. The Los Angeles County farm bureau in answering similar questions has this to say as to root knot and summer blight:

Root Knot

Frequently when tomatoes are grown on sandy soils the vines suddenly turn yellow, growth stops and they slowly die. No unnatural spots are seen on the leaves but on digging up the affected vines the root system will be found largely rotted away with only a few swollen and distorted roots remaining. This condition is caused by the nematode worm. These worms are so small as to be hardly visible by the naked eye. They get into the roots from the soil and produce the gall or swelling which results in the decay of the roots.

The control of nematode worms is often difficult. There is nothing to do for affected plants except to pull them up and remove from the field. It is hardly worth while to put new plants in the vacant places as they are likely to become infested. Rotation of crops in such a way as to have corn, sorghum, barley, etc., upon which the worms do not feed, occupy the land for several years will starve them out.

It is particularly important to see that the seed bed is free from these worms for it often happens that plants becoming infected in the seed bed before removal to the field will result in large losses.

Summer Blight

The amount of this disease varies greatly from year to year. It is common throughout the coast districts of California. Some seasons the losses are enormous. Last season the loss was relatively small. It is characterized by the dying of individual plants throughout the field. Affected plants show a purplish color on the veins on the under side of the leaves. The leaves curl in the latter stages.

This season's losses are quite severe and it is with great regret that it is necessary to state that no cure is known.

To the Farmers of America:

The men who till the soil are whole heartedly behind the government to win the war. None have shown themselves more ready to do their utmost. The volunteers they have supplied, the money they have given and the wonderful crops they have produced, crops greater in proportion to the number of farm workers than the world has ever seen before, prove that beyond dispute. None are more determined to leave nothing undone that will help to bring victory. With them the great question is how they can serve best. Without doubt their first duty is to supply food without which victory is impossible.

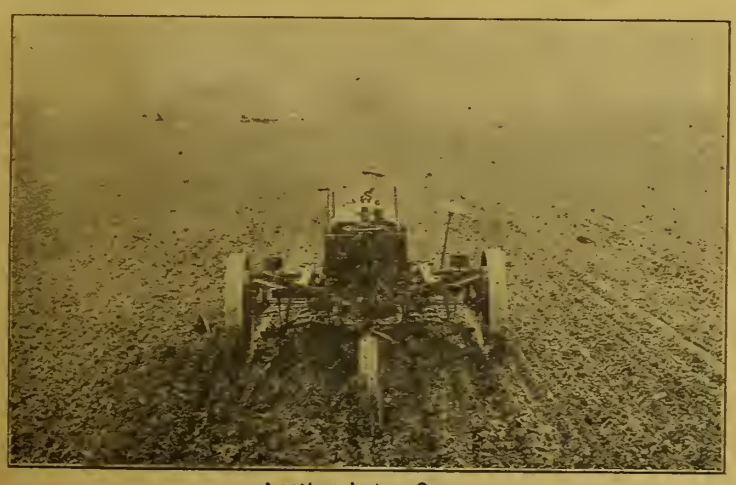
With this fact in mind the federal board of farm organizations hereby calls upon the farmers of the United States to assemble in person or by their representatives in the city of Washington, August 27, 28 and 29, 1918, there to consider, decide upon and take such action as will best promote the production of farm crops in 1919; sufficient, first, to supply our own people, our allies and the neutrals who depend upon us, and second, to replenish our national reserves of grain, live stock and dairy products, now depleted to a point where a single short crop will threaten us with famine.

Farm and Home Drying of Fruits and Vegetables

The bureau of plant industry United States department of agriculture has issued Farmers' Bulletin 984, "Farm and Home Drying of Fruits and Vegetables," by Joseph S. Caldwell. Imperative necessity demands nation wide conservation of those portions of our food crops which have heretofore been permitted to go to waste. A considerable portion of this wasted food material is made up of perishable fruits and vegetables produced in home gardens and fruit plats in excess of the immediate needs of the producers and in the absence of accessible markets for the surplus drying offers a simple, convenient and economical method for preserving food materials and permits the carrying over of the surplus into periods in which fresh fruits and vegetables are expensive or unobtainable.

The bulletin may be had without cost by writing Division of Publications, United States Department of Agriculture, Washington, D. C.

All private stocks of olive oil in Italy in excess of actual family needs have been requisitioned by the government.



Another Labor Saver

Planting corn with an Avery motor. The planter, the drill, the cultivator are all possible in a light weight combination of this kind.

One Man Does All The Work With

WATERLOO BOY

The Original Kerosene Tractor

Farm labor shortage is no bugbear to Waterloo Boy operators. This one-man, three-plow outfit does more work with less expense than any three of your drafted farm hands. Distinctively simple, strong construction, with automatic trouble-preventing features wherever feasible, gives you assurance that

You Can Place Your Trust In Waterloo Boy Guaranteed Power

for continuous hard work at plowing, discing, harrowing, planting, harvesting, threshing, corn shelling, silo filling, etc.

Jno. E. Cox, Calipatria, Cal., owner of three Waterloo Boys, writes: "These tractors are working every day, doing heavy work—each of them with a load equal to a liberal 10-horse pull."

Some features of Waterloo Boy construction which appeal strongly to tractor buyers are: Unusual fuel economy due to our patented inbuilt carburetor and manifold, which gets full power from inexpensive kerosene; large, wide wheels, which, with extra transmission strength and a powerful motor, give great tractive power, enable the Waterloo Boy to move easily over soft ground without packing soil.

Learn more about this tractor. Our Illustrated Catalog gives many proofs of Waterloo Boy superiority in construction and performance. It is free. Write for it.

Farm for Profit

and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

Big Game Rifles and Metallic Cartridges
for Shooting Right

STILL-HUNTING—stalking your game, like a sportsman—appeals as strongly as ever to the man who is all man. But to bring home venison it is necessary nowadays to shoot *right*, at the first opportunity—it may be the last.

When that well earned chance comes, be ready with a Remington UMC Big Game Rifle (either pump action repeater or the autoloading model), made to shoot *right*. Has the speed, the accuracy and the punch to do its work quick and clean.

Easy to shoot because fit, balance and design are *right*—no lever or bolt to blindly grab and wildly yank, your hands stay *right* for shooting—handles nicely and is comfortable to carry—simple, strong and reliable.

To complete *the perfect shooting combination*, buy Remington UMC metallic cartridges, for years the *right* choice for use in all kinds of rifles all over the world. When improvements are made in metallics, Remington UMC makes them first.

Cut More Corn
With Fewer Horses and Save Breakages to Make More Profit

Mounting a Cushman Motor on any Corn Binder will enable two horses to do the work of four or six as they never tire pulling only the weight of the machine.
The mechanism is run steadily relieving all stress and strain from the binder.
The motor may be taken off to do any other farm work using one to five horsepower.
The CUSHMAN will do MORE KINDS of FARM WORK than any other engine made.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Rhodes Grass

Somewhere I have heard of a kind of pasture grass called Rhodes grass. Could you tell me where it can be grown and where I can get the seed? I have some low ground that will not raise alfalfa. I wish to use the land for pasture. Would this grass be what I am looking for?—Subscriber, Bakersfield.

Rhodes grass has been tried and has succeeded well in South Africa where it originated. It was planted there quite generally by the late Cecil Rhoades. The Cyclopedia of American Agriculture says: "The grass has done well there, forming heavy sods of good herbage. It does not seem to be drouth resistant, at least, it is not able to withstand very severe weather." Its trial in California has been very limited. It seems to find the summers are very trying.

Ducklings Have Indigestion

I have 125 White Muscovy ducks, just beginning to feather out. Every day or two one or two get apparently dizzy and stagger around, sometimes falling on their backs and cannot get up. I have lost 10 or 12 in this way. They have good appetites and eat when they cannot stand up. At first I thought it was the heat during the day and cold nights. They have a good shade. I feed stale bread, bran, plenty greens and a little Surelay. Can you tell me what is the trouble?—Subscriber, Galt.

Your ducklings are dying from indigestion. It may be they are chilled at night, but more probably the trouble is in the ration. I am not told whether the bran is fed dry or is moistened with water. Ducklings always do better on a wet mash, and the mash should contain not only ground and cut-up greens, but a good handful of sand. A good ration for ducklings this age is: Equal parts bran and corn meal, moistened with water till it is crumbly, with about 20 per cent cut-up alfalfa or other greens added, and the sand, which should never be omitted. Just what the preparation called "Surelay" contains I do not know, but its name would indicate that it is a food for laying hens rather than for ducklings. A very little beef scrap may be added to the mash if you wish to hasten growth, and the amount may be gradually increased till it is ten per cent of the mash, but ducklings do very well without it, and it is expensive.—J. A. K.

Hogs per Acre

I notice in your number of August 3 an answer to a question entitled "Hogs per Acre," stating that 15 pounds of green alfalfa will make one pound of pork. I think this must be a mistake because if this were so 15 pounds of green alfalfa would equal four pounds of corn and I could get five times as much for feeding the green alfalfa as I could get by selling it. If you can tell me how to get one pound of pork from 15 pounds of green alfalfa I would like to have you do it. Can you tell me what the feeding value of red yams is in pork production?—Subscriber.

We rather think Mr. Hull has the best of the argument, but, as we noted in the query "Hogs per Acre" on Page 106 of the issue of August 3; "Here are some figures given in 'Swine in America' by Coburn, and we have verified the statements by noting on Page 161 a table giving comparative values for pork production of one acre planted to green alfalfa and to various grains, which is based on the supposition: "If a comparative basis be taken of four pounds of grain or 15 pounds of green clover or alfalfa to make one pound of pork . . ." The low production per acre of ten tons of green alfalfa given in this table may be accounted for by the fact that it is pastured and not cut alfalfa, but the ratio of 15 pounds to the pound of pork is maintained in the number of pounds of pork per acre, given as 1333. We also think the figures given by Mr. Coburn, four pounds of grain to one pound of pork, are rather in error, for we have heard practical pork producers assert that it takes at least six pounds of grain to make one pound of pork.

But, returning to the question asked by the Oxnard subscriber as to number of hogs per acre, we note in another book, "Alfalfa", also by Coburn; "A Kansas farmer reports having pastured 30 pigs on one acre of alfalfa from May 1 to September 1, when they weighed 100 pounds each and were in fine condition for fattening. Another reports keeping 100 pigs from about the middle of April to September on five acres of alfalfa pasture." Also in Henry's "Feeds and Feeding": "In tests at the Iowa station by Evvard and Kennedy in which pigs were fed corn and tankage on alfalfa pasture the alfalfa produced 623 to 865 pounds of pork per acre, after deducting the gains to be credited to the concentrates fed, and without crediting the alfalfa with the hay cut from the pasture. In one trial an acre of alfalfa carried an average of over 16 spring pigs for 180 days, producing 1.05 pounds of gain per head daily."

We think that all hog feeders fully understand that the production of a pound of pork, or any other number of pounds, on green alfalfa is more economically done where, in addition to the alfalfa, there is a ration of grain or other concentrates. Here is an opportunity for our hog feeders to be helpful to each other in telling how the greatest amount of pork can be produced with least expenditure for alfalfa and concentrates.

We are unable to find data regarding feed value of yams. The digestible nutrients of the sweet potato, however, are given by Henry in "Feeds and Feeding"; dry matter, 30.2 pounds in 100 pounds of sweet potatoes. Of crude protein it contains 0.9 per cent; carbohydrates, 24.2; fat 0.2 per cent, or a total of digestible nutrients of 25.8 pounds. Compared with the sugar beet, it has nearly twice the dry matter, practically the same crude protein, nearly twice as much of carbohydrates, and three times as much fat. Bear in mind this is the ordinary sweet potato, probably higher in carbohydrates than the yam.

Linnets

Could you give any method of getting rid of the birds commonly called linnets? The state has a law, I believe, to rid it of gophers and squirrels, which is a splendid thing, and why not rid the country of these pests which destroy far more than gophers and squirrels. They are on hand during the winter to eat the fruit buds, and in the summer to take everything in the way of grain. Ourselves and several neighbors have planted milo in large quantities for poultry and I doubt if there will be any to harvest. Surely these pests should be exterminated.—Subscriber.

There are seasons when linnets are

most destructive pests. Poisoning as a rule is unsuccessful because of the vast number of beneficial birds destroyed at the same time. In fact we may say that linnets have some long marks on the right side of their ledger, but when they come in such quantities as to do a great deal of damage the farmer in self protection must get busy. The boy with a shotgun is perhaps one of the best control measures. Fluttering paper and bright tin in the trees frighten away a few. If poison has to be resorted to use water and strychnine, water three gallons, strychnine one-eighth ounce. This should be poured in shallow tin pans and placed among trees and it will destroy many of the birds.

Tomato Wilt

In the Cultivator of July 20, page 59, we answered question of Redlands subscriber as to sending of tomato plants in effect that it would be necessary to send specimen of roots of affected plants before determination of the trouble could be made. The roots were sent and forwarded by us to the citrus experiment station at Riverside, and Prof. J. T. Barrett answers:

"An examination of the root tissues did not reveal the presence of any organism. Therefore I must conclude that the plants are not infected with the fusarium wilt. However, there are two other types of wilt that have been recognized this summer on tomatoes. One of them is the so-called California wilt, the cause of which is not known but which causes the death of many plants and has been very prevalent in Los Angeles County. The other is caused by a fungus which attacks the small rootlets, causing them to decay and thus eventually killing the plant. As nearly as I could make out from the specimens submitted which were in a very dry condition, I judge that they are suffering from the California wilt. We do not know of a remedy for this trouble."

Roup

I would like to know what causes canker eye in my pullets. They are four months old and nearly every day we find one affected. I treat it with boracic acid but it is some time before they get over it. We have an up-to-date hen house on a new place and proper ventilation so I don't see what causes it. We have a dry mash in front of them always and we feed barley and corn. The barley we soak as they don't like it dry.—Subscriber, El Cajon.

The disease you call "canker eye" I take to be some form of roup, either what is known as swellhead, or roup of the eyes. It is quite contagious and would easily he passed on from pullet to pullet if the first case was not promptly isolated. As to just what the cause may be, I should have to know a little more about the environment of the birds. Assuming that the ventilation is all right, is it possible, perhaps, that you have too many pullets in one house? Two square feet of floor space is as little as Leghorns will do well with. Heavy hens require more. The location of the house plays an important part, also. If your house is in a hollow where water from adjoining land runs into the yard or the moist air from adjacent slopes settles down on and about it, you will have more trouble with roup. Sometimes too a predisposition to roup is congenital. The birds have roup because their mothers had it. If you will isolate every pullet that is in the least affected and band them so that not one is ever used as a breeder, taking care that your house and yard are always dry, I think you will soon conquer the trouble. The best treatment for the affected birds is a potassium permanganate solution. Fill a lard pail with warmish water and add a few crystals of permanganate of potash, just enough to give the water a deep purple tint. Dip the heads of the affected birds in this and hold them under a few seconds. The permanganate clears out the nasal passages and washes out the eyes. This treatment morning and night for a week will cure most cases. If the eyes are inclined to be sticky in the morning rub a little white vaseline on at night.—J. A. K.

Homemade Syrup from Sugar Beets

Could you please tell me how to make syrup from sugar beets? Also how can I tell when the beets are ready to use? — Subscriber, Spenceville.

See instructions in "Home Made Sugar" in Cultivator of March 16, 1918, Page 329. The period of ripening depends upon the time of planting, locality in which heets are grown and other factors. The sugar factory at Visalia has been runing for some time and may close its operations hefore the factory at Spreckels hegins. But for the individual here are suggestions from "Manual for Sugar Beet Growers," by Adams: "Plowing out should be delayed until the beets are ripe. Maturity will he indicated by a yellowing in the color of the leaves after the beets have been in the ground four months or more, accompanied by a slackening of growth and a ring of dead or dying leaves around the outer circle of the beet. Sometimes drying out is confused with ripening, but this occurs where the moisture conditions are unfavorable. Where this occurs the seemingly ripe characteristics will apear more or less abruptly and the root will be soft, dry and rubher-like. Mature beets are solid, hrittle, juicy and with a sweetish taste."

Lump on Hen's Face

Last November a White Leghorn hen had small lumps on her face. I first thought it was roup but upon examination found the lump very hard. This lump has grown in size till now it is much larger than the size of a pea. It is red and shiny and very hard. She will be two years old next October and has never been sick except a slight attack of rheumatism in her first year. She is an exceptionally good layer and has laid steadily during the time she has had this lump. Have a White Rock pullet developing the same kind of lump. Can this be a tumor or do you think something could have worked up through her nose and caused this lump? Is she fit to eat? or would you advise us to keep her?—Suhscriher, Redondo.

As far as I can judge from your description, the lump is a tumor of some sort, but it should not interfere with the hen's fitness for food. As she is an old hen the best thing you can do is to eat her. In the case of the pullet it might be well to try painting the lump with tincture of iodine once a day for a week or so. If the lump continues to develop, eat her also. These lumps may be the result of a rheumatic condition for which the best cure is warm, dry quarters and plenty of green feed.—J. A. K.

Nematode Root Knot on Teparies

I am enclosing roots of Tepary beans which look as if affected by wilt. Some plants showed the same trouble last year, hut it is worse this year. I cannot find any insect on the plant. Do you think Blackeyes would do better in the same land next year? —Subscriber, Manteca.

These roots were submitted to Clayton O. Smith of the Riverside experiment station and he answers that they are infected with the nematode root knot. This disease is common on many of our cultivated and wild plants. I do not have any data regarding whether it is common on the Blackeye bean, although it is reported on two other varieties of cowpeas, and probably also attacks the Blackeye bean. There is no very good control for this disease, as the worm lives over in the soil for several years. Certain plants, however, are much more resistant to this trouble, and it would be best to plant some of those crops.

Also see "Tomato Troubles" on Page 153.

WHEN the "whole Avery Outfit" arrives on your farm you can say good-bye to a lot of expense and look forward to bigger crops and more profits. Your work will be easier and more interesting.

The "Whole Avery Outfit" Will Give You

an Avery Tractor for doing your heavy work, such as plowing, preparing the seed bed, harvesting your grain crops, and road work,—

an Avery Motor Cultivator for planting and cultivating your corn, beans, cotton, and other row crops,—

an Avery Grain-Saving Separator for threshing your grain, clover, kaffir corn, rice, etc., and putting it where it belongs, in the wagon box and not in your straw stack,—

an Avery Plow in either light or heavy style to fit the soil conditions on your farm.

Power For Every Size Farm

Avery Tractors are built in six sizes. You can get a size Avery Tractor to exactly fit your size farm. The five sizes from 8-16 h. p. to 40-80 h. p. fit all farms from the average up to the largest sizes. The little 5-10 h. p. is built especially for small farms or for doing the light work on larger farms.

You can also get an Avery Plow in any size from two to ten bottoms. Avery Threshers are built in small, individual sizes as well as for large threshing runs.

The Avery is the one complete standardized line of farming, threshing, and road building machinery.

It is built entirely in the Avery factories and is backed with Avery service through Branch Houses and Distributors covering every state in the Union.

The Tractor that turns Distillate into Gas

You want a real distillate burning tractor. That is what you get in the Avery. They are the only tractors with a Duplex Gasifier fuel system. It does the trick—turns distillate into gas.

Avery's are the tractors with the patented sliding frame transmission that makes expensive intermediate gears, shafting and bearings. unnecessary. The tractors with the renewable inner cylinder walls. The tractors with the adjustable crankshaft bearings. The tractors with the low-speed tractor motor specially designed for field work or belt work, etc.

Write for the Avery Catalog The Avery catalog shows the complete Avery line of motor farming machinery in their natural colors and gives you valuable facts on motor farming. Let us put you in touch with the nearest Avery dealer. Address

Aerate Sorghums

California has not had the trouble experienced by Eastern growers of sorghum grain, though to a degree heating is a factor in this state. The department has issued a bulletin on prevention of this trouble and it contains information which will be of much value to the sorghum grower. The bulletin may be had (without cost) by writing Division of Publications, U. S. Department of Agriculture, Washington, D. C.

The bulletin says:

"The most important groups of grain producing sorghums are kafir and milo. The grain sorghums are of comparatively recent introduction. They are now extensively grown in the southern half of the Great Plains area.

"Sorghum grain is feed for stock and food for man. It also may be used in making alcohol. The grain has about 90 per cent of the feeding value of corn. It is a profitable feed, therefore, when the price is not more than 90 per cent of the price of corn. Where the yield is ten per cent more than the yield of corn, grain sorghums are as profitable crops to grow as corn.

"Sorghum grain is relished by all stock and poultry and if of good quality is readily eaten. For human food the meal can be used in every way that corn meal is used, and the grain may be popped like popcorn.

"The thrashed grain should be thoroughly dry and as clean as possible before it is stored in bins. Broken kernels and dirt pack so closely that they exclude the air and so increase the danger of spoiling. Bins for sorghum grain should be equipped with simple and easily made ventilators."

Principles affecting the storage of these grains as given by the bulletin are:

The more moisture the grain contains when put in storage, the more readily it will heat.

The larger the quantity stored in a single bin, the greater the risk of damage by heating.

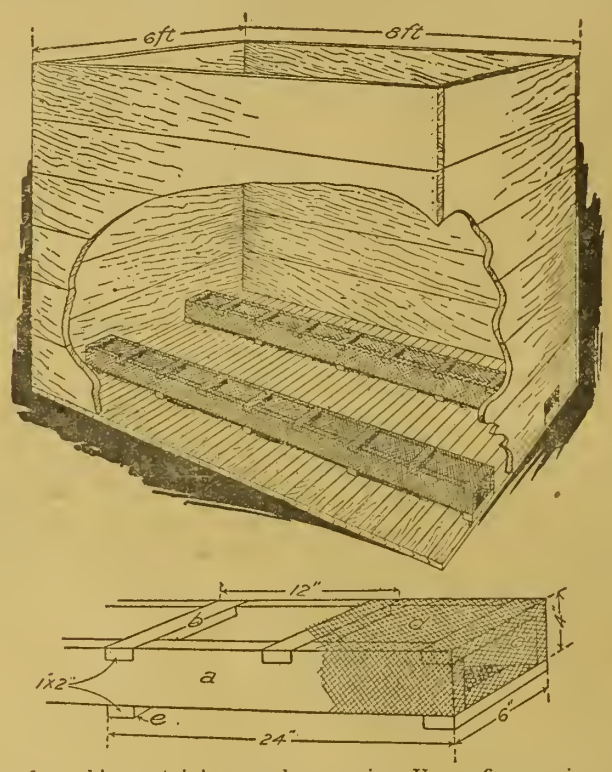
The warmer and damper the climate, the quicker the grain will get out of condition.

The more cracked kernels and dirt the grain contains, the closer it packs, the less air can circulate, and the greater the danger of loss.

Weevils working in grain increase its temperature and decrease the spaces for air circulation, thus making conditions favorable for further damage from heating.

In elevators it usually is possible to prevent damage from heating when it first starts by running the grain from one bin to another. In this way it is aired and cooled. This shifting of the grain must be repeated whenever rising temperature in the grain makes it necessary.

Most farms are not equipped with machinery for handling grain. The farm bin, therefore, should be provided with ventilators if these grains are to be stored. Different kinds of ventilating devices have been described. Of these, only one of the most practical is described and illustrated in this bulletin.



Ventilator for a bin containing sorghum grain. Upper figure, view of two ventilators in position on floor of bin, showing opening in side of bin. Lower figure, detailed structure and dimensions: (a) Side of ventilator; (b) cleat mortised in upper edge of a; (c) wire screen over end of ventilator; (d) wire screen covering top and bottom, also sides; (e) cleat on bottom to raise ventilator from floor.

Student Testifies to Inspirational Value of Farmers' Short Course

W. R. Greenwood of Winchester, Riverside County, has written to the college of agriculture of the University of California in regard to the great inspirational value of the Farmers' Short Courses held at the University Farm at Davis. The Farmers' Short Courses for the fall season will open Monday, October 1. Full information in regard to the subjects to be offered may be obtained from the College of Agriculture, Berkeley, or from the University Farm School, Davis.

Mr. Greenwood's statement is as follows:

"If I were to attempt a 'quantitative' analysis of the value of the short course to me, I would at this time fix the percentages something like this:

	Per Cent
Inspiration	40
Information	30
Social and vacation enjoyments	10
Training	10
Miscellaneous	10
	100

"In the 'miscellaneous' item I would include the equipment which the short course provides for getting facts. By this I mean that the short course student is provided in a small way as the county farm adviser is in a larger way so he may know to what authority to apply for anything he needs to know about his farming operations.

"I may seem to have given 'information' from the lectures, etc., too small a percentage, but if it is small in proportion it is not really small for the whole thing is so big.

"I firmly believe that every farmer in the state ought to attend one of the short courses every five years. These courses are an invaluable aid to the beginner in rural work, but the experienced husbandman can get much from them that the novice cannot."

GRANGE AS AN EDUCATIONAL FACTOR

Continued from Page 149

high schools and even in the elementary schools; of the farm bureaus with their farm advisers all over the country and you will get some idea of what the agricultural department is doing. And yet no other one force did more to get this department firmly established than did the Grange.

Taking up the educational work in a more direct way, we just mention the fact that several of the states are assisting worthy young men and women in securing agricultural educations. Several state Granges have what they term revolving educational funds. These funds vary in amounts with the several states and are loaned to young men and women who are not able to complete their agricultural education in any other way. After these students have completed their courses and become able to do so, they are expected to turn the amounts borrowed back to the Grange revolving funds and it is then loaned again to others for the same purpose. Last year Massachusetts assisted 90 young people to secure their education.

And so it is all through our work. We always encourage education; and before leaving this part of the work, I must call attention to the greatest of all our facilities for educating the farmers and that is the opportunity given them to attend our regular meetings and of learning through these meetings the opinions and practical experiences of the best and most successful and most progressive farmers of the community, as well as to learn to stand on their feet and express their own opinions.

One of the crying needs of the farmers today is to get more of them to be able to attend public meetings and take the part in the meetings that farmers ought to take. Whenever it becomes necessary or advisable to call any public meetings which directly concern the farmers, these meetings are invariably called and conducted by men who are not practical farmers. Why is this the case? Simply because the great majority of farmers are not sufficiently educated and have not the confidence in themselves to take their proper places.

There is no better agency than the Grange to teach our farmers to think clearly and argue intelligently. And when they have learned that they will be able to form definite conclusions on public issues and then maintain their stand.

A glimpse is now afforded of the kind of government the nihilists always wanted.

Elevator Pays for Itself

The Sutter County Farmer gives account of an elevator built at Hamilton in Glenn County, which was recently inspected by a number of Sutter County people. It was built by one of the larger Glenn County farmers, and if the economical methods which it permits can be secured in other sections the state should be dotted with elevators before another year. In the account of the inspection we note that:

"The elevator at Hamilton City is a new one and has a capacity of 60,000 sacks. It was built for $18,000 and as the owner will harvest approximately 100,000 sacks of grain this season he will save $26,000 on bags alone, thus paying for his elevator and having $8000 besides. He is operating three big steam harvesting outfits and upon each is a storage bin of 50-sack capacity. No sack sewers or tenders are required, and the grain is taken from the harvester, unloading by gravity from the bin into other bins on motor trucks and conveyed directly to the elevator where one man handling a set of levers does the rest. The grain in the bins on the trucks is emptied into a chute and then taken to a bin for weighing, then conveyed through a cleaner and then to the proper grade apartment in the big structure. The loading from the elevator into the cars is done just as easily and quickly. Under this method there is a saving in the cost of handling, a saving of grain and a saving of time."

How to Poison Gophers

Written for California Cultivator By C. A. Nidever

I NOTICED an inquiry in your paper as to best method of poisoning gophers.

The regular grain poison put up for squirrels is as good as anything. It is generally barley these war times. The important part of the operation is to get the poison in the right place.

At this time of the year when the ground is dry dig with a shovel until the runway is opened up. A gopher has a runway anywhere from six inches to 24 inches under the ground. The opening at the top is only an offshoot from the main run and is always plugged with dirt again, while the main runway is always clear.

After finding the main runway put a quarter or half a teaspoon of poisoned barley in each opening. Place a clod over the hole to keep the dirt from running in onto the poison and cover over with dirt.

When the ground is dry the gopher works closer to the top in the loose ground broken by the plow. In damp ground he goes deeper. In the spring the runway can often be found in the damp soil by inserting a sharp stick. A person can tell when the point breaks into the run. Drop in a little grain and cover with a clod of dirt.

Gophers are very easy to control if one will take a shovel and go to it. They will eat poisoned fruit, nuts, raisins and vegetables, but the easiest and cheapest method is to get the regular poisoned grain.

By systematically going over the ground every two or three days gophers can be entirely eradicated. Get the poison in the main runway and you have got a dead gopher. Get them. They are Kaiser Bill's friends.

Important to Cotton Raisers

State Entomologist Morrill of Arizona issues a statement as to keeping some serious pests out of cotton fields in a very simple way. He writes:

Alfalfa fields are breeding grounds for the most destructive cotton pests in the state. When an alfalfa field is cut beginning at the side opposite and working toward a cotton field certain pests, particularly grasshoppers and the cotton square stainers, are driven to the cotton plants, and the resulting damage to the cotton is frequently very serious.

Grasshopper damage is conspicuous since these pests when present in large numbers may completely defoliate the plants. Usually such severe injury is confined to a few acres on the side of the cotton adjoining an alfalfa field. Prompt action in spreading poisoned baits in the heavily infested areas will check these pests.

The most serious damage resulting from driving insects from alfalfa fields is done by a small sucking bug heretofore called the tarnished plant bug, but which may more appropriately be called the cotton square stainer. This insect sucks the cotton squares (flower buds enclosed by three bracts), causing them to flare, turn yellowish and drop off. While feeding on the squares the insects daub the buds and the inner sides of the bracts with a yellowish liquid excrement which almost invariably indicates that the square will soon flare and fall. Newly set fruits or bolls are injured in the same manner. An average of two of the bugs to a plant is sufficient to prevent the setting of any bolls. When driven from alfalfa fields their numbers sometimes average eight or ten to a plant.

These bugs are not new. Their injury in the Salt River Valley during the past three seasons has been described by the state entomologist in his last three annual reports. The appearance of the insects in excessive numbers is usually local, but each season a few cotton growers suffer heavy losses. With the greatly increased cotton acreage this year a proportionally large number of growers are interested in means of preventing these losses. While the pests have been observed, in one instance at least, to occur in excessive numbers on cotton growing two or three miles from alfalfa, as a rule the most severe infestations are found where cotton fields adjoin alfalfa fields and where in cutting the alfalfa the work has been started on the side of the field farthest from the cotton.

On account of both the grasshoppers and the square stainers alfalfa cutting and raking should usually be started on the sides of a field and continued toward the central land or a land near to it which should be left temporarily as a trap. When concentrated in a limited area in this way the grasshoppers may be poisoned with poisoned bait or captured by means of a "hopper dozer". A modified hopper dozer is being made for trial in the hope that it will capture the cotton square stainers as well as grasshoppers. Even though no practical means is found for capturing or destroying the square stainers after they have been concentrated on uncut alfalfa in the middle of the field, much benefit will result from the cutting practice recommended. On the other hand the practice of cutting alfalfa from the far side of the field working toward the cotton is very likely to bring disastrous results to the cotton grower.

CALIFORNIA STATISTICIAN'S REPORT

The state board of agriculture is sending out its most complete report. It is much larger than any preceding one; there are 538 pages, touching upon nearly every feature of California's production and mercantile industries. It is compiled by State Statistician George Robertson. The introduction is prepared by President of the Board George C. Roeding, which closes with: "As representatives of the great producing interests of California, let us cheerfully do our share and give our aid in promoting the wonderful resources with which this grand state of ours has been so magnificently endowed."

Arrange your work so you can be sure to attend Mammoth 3d Annual Tractor Demonstration

Whittier Boulevard
One-Half Mile East of Los Angeles City Limits

This is the crucial time when production of food is of paramount importance. Food must be raised on a larger scale than ever before. The United States Government is urging farmers to bend every effort to augment the food supply.

The greatest single factor in increasing food production is the Tractor. Every farmer and rancher in the Southwest should plan now to attend the great tractor demonstration to be held September 17, 18, 19, 20 and 21.

There will be hundreds of interesting features — a galaxy of special events daily that will astonish you. Over 40 kinds and types of tractors will be on display and in actual operation. Many entirely new types of tractors received direct from the factories will be exhibited. Scores of interesting farm implements, as well as motor trucks, automobiles, tires, oils, accessories, etc., will be displayed.

—bring the family along

The Horse Breeding Situation

Written for California Cultivator by Wayne Dinsmore, Secretary Percheron Society of America

I HAVE but recently returned from a business trip through the Canadian Northwest and down the Pacific Coast, and have just finished going over my correspondence with horsemen in the corn belt states. It occurs to me that you and your readers will be interested in knowing about the horse breeding situation in the districts mentioned.

Northwest Canada believes in draft horses, especially Percherons, as is shown by the fact that her farmers bought more than 1000 head during the 19 months ending July 1, 1918. They want more good Percherons there, but have been hard hit this year by the drouth, and because of lack of feed, grain and money, will not be in as good a position to buy breeding stock this coming winter as in the past two years. I look for considerable trade, however, in spite of the partial failure mentioned.

On the Pacific Coast the demand for horses standing over 16.2 and weighing over 1700 pounds is in excess of the supply, but there is a surplus of smaller stuff. Fred H. Bixby of Long Beach, who has very large ranches at seven different points on the coast, and who is one of the best informed horsemen, says:

"In regard to the horse conditions in California, I am of the opinion that a great many of the former horse breeding companies have gone out of the business, but this last spring the horse business seems to have begun to look up, and a good many people are breeding again, and I think within a year or two the business will be in a flourishing condition.

"The mule market is improving by rapid strides. I am quite positive that within the next two or three years, regardless of the tractors and motor trucks, the horse and mule business will be back to its normal state.

"We find no trouble in disposing of our big horses and big mules, but the horses weighing from 1200 to 1400 pounds and the mules under 1000 pounds are poor sellers.

"I am of the opinion that the owners of Percheron, Shire, Belgian, or Clydesdale stallions could sell them now quite easily on the Pacific Coast, provided they put a reasonable price on their animals.

"I think the day of the $3000 to $5000 draft stallion for use on grade mares is over for at least the next ten years. The stallion men will have to get down on earth if they want to do any business, and if they do they can make a whole bunch of sales."

Miller & Lux, who own 10,000 horses in California alone, believe that heavy draft horses will be in strong demand within a few years, and at high prices. Anticipating this they are breeding every available mare, 1800 to stallions and 700 to jacks—and intend to be prepared to reap the benefit of the probable demand.

In Utah and Colorado the best informed horsemen are of the same opinion. In every district visited there was a decided shortage of real drafters, and of foals, yearlings, or two year olds that promise to develop into draft proportions. Many men reported that they were even now in the market for more big farm teams and knew not where to get them.

The inclination to swing all attention to grain and meat production has unquestionably cut the breeding of heavy work horses and mules to a dangerously low level. We must not permit our reserves to fall away to a point where agricultural production will be impaired. It is up to each farmer of the corn belt to raise the horses and mules he will need for replacement purposes three years from now, and to rear enough surplus to provide for at least two other farms that raise none; for there are thousands of farmers in the East, South and West who do not produce their own work animals and who must buy.

Let us not fail to produce the horse power that is so urgently needed in this critical time. The war will be won by the side with the largest reserves.

No Proteinless Days for Hogs

Feeds that are rich in protein, such as shorts, middlings, tankage, and oil meal, so essential to the proper development of hogs, are hard to get and high in price. The United States department of agriculture is urging that hog growers provide substitutes for these feeds in the form of home grown crops that are known to be rich in protein, and is advising the use of fish meal where it is obtainable. Alfalfa hay, soy beans, cowpeas and oats are suggested as good substitute feeds. In addition to these peanuts, cottonseed meal and velvet beans are available to hog growers in the Southern states.

Fish scrap, which has heretofore been used as a fertilizer, has been tried in hog feeding experiments conducted by the department of agriculture, and it has been found that meal made from this material is on a par with tankage when fed to hogs. A number of state experiment stations are now conducting similar experiments in feeding fish meal to hogs. Owing to the transportation situation, however, it is believed that fish meal can not be fed economically in the Middle West.

Shortage in protein feeds can be met with alfalfa hay in all localities where it can be grown or obtained at reasonable prices. There are two ways in which this hay can be successfully fed—in small racks placed in protected sheds where the hogs may have free access to it, and by grinding it and feeding it in self-feeders or soaked in the form of thick slop. The department's specialists urge that hog growers provide an ample supply of alfalfa. Usually the last cutting of alfalfa is saved for hog feeding, but for fear this cutting can not be harvested in good condition, on account of weather conditions, a sufficient amount of the second and subsequent cuttings should be saved to supply enough feed for hogs.

Rye sown in the fall makes good pasture for hogs. As soon as it is three or four inches high, the hogs can be turned in.

Soy beans are valuable to take the place of other protein feeds usually purchased. They make a very satisfactory feed when the beans are fed thrashed, or as hay, or when ground as meal. Soy-bean hay, to be most satisfactory, should be cut early enough to avoid the popping out of the seeds. The leaves and the seed both will be readily eaten when handled in this manner.

SHASTA COUNTY STOCKMAN DEPRIVED OF GOVERNMENT RANGE

Because he was too tired to fight a forest fire which he had discovered, and because he failed to report it to the forest ranger, W. L. Callison, a well-to-do rancher and stockman of Shasta County, has been ordered to remove his cattle from the Shasta national forest within ten days.

Some time ago Callison and his son, while on a trip to Dick Rock Flat, in the mountain south of Bartle, Siskiyou County, discovered a forest fire. They returned home next day without making any attempt to put the fire out and, although they passed two telephones on their way, neglected to report the matter to the forest ranger.

Before obtaining a permit to graze cattle or sheep on the national forests of California, every stockman must sign an application in which he agrees to "render all reasonable aid in extinguishing forest fires within the district in which the stock is grazed." The permit itself may be revoked and the stock must be removed from the forest "for a violation of any of the terms of the application on which it is based."

"To successfully protect food, forage and forests from fire," says Acting District Forester Headley, "we must have the whole-hearted support of everyone using the national forests. The stockmen of the state have as a whole come forward in excellent shape this year. Such individual cases as the Callison instance will of course be promptly dealt with."

EMERGENCY FEED FROM DESERT PLANTS

An emergency drouth time feed for Southwestern stockmen which has previously been overlooked is the desert shrub locally known as soapweed. Its scientific name is yucca. While this plant is not high in nutritive value nor suitable for feed until it has been properly ground, the specialists of the United States department of agriculture have found that in seasons of drouth when range grasses and other sources of feed fail it can be used to save cattle and sheep from starving. By the addition of a little cottonseed meal with ground yucca a fairly well balanced ration is made. By using this feed without waste in dry seasons only, a fair crop will always be available. If it is used properly and due regard given to conserving the present supply, thousands of cattle may be saved during the drouth season to add to the nation's meat supply.

There are a score or more species of yucca. Sotol has been utilized as stock feed for some years, but only recently have soap weed and bear grass, two other forms which grow abundantly, been utilized in this way.

SHADE AND WATER FOR HOGS

Donald Acklin of Ohio, one of the state and federal representatives working for the increased production of pork in this season, is calling attention to the need of shade and water for hogs at this time.

"During the hot summer months," Mr. Acklin says, "shade and water are of the most vital importance in the successful production of pork. If nature has not provided shade in your pastures and lots, build some sort of shelter in a fence corner. Uncomfortable animals do not thrive.

"If you are not provided with a spring or running water, an automatic waterer is almost indispensable in hot weather. Clean water is essential. A clean wallow should also be provided.

Concrete wallows are inexpensive to construct and aside from serving the purpose of keeping hogs cool, they will keep the herd absolutely free from lice if a coal tar dip is used in the water."

SELF FEEDERS NEED ATTENTION

As a result of the shortage of farm labor the use of the self feeder for hogs has been widely advocated this season. Some of these devices do not "feed down" properly and the feed is sometimes withheld from one or more compartments. Even when the feeder is working properly the feed is likely to become exhausted in one compartment before it does in the others. If any part of the ration is lacking the hogs are sure to eat more heavily of the remaining feeds, sometimes of the most expensive ones. This wastes feed, has a detrimental effect on the digestion of the hogs, and is likely to result in a loss of profit. The self feeder is, therefore, to be carefully watched.

New System of Alfalfa Irrigation

Written for California Cultivator by W. A. McCall

THIS system, originated by A. F. LeGay of Elsinore and practiced by others in the Elsinore Valley, begins with the preparation of the soil for seeding.

The ground is harrowed perfectly smooth and seed sown. Then furrows 36 inches apart and about four inches deep and four inches wide are run through the field with a cultivator. A chain is hung loosely from the cultivator shovels and dragged behind, which levels down the edges of the furrows and covers the seed.

To irrigate alfalfa the water is run rapidly down the furrows until it reaches the end of the field, then it is run down slowly until it has seeped out on each side and the three foot strips between the furrows are entirely saturated. The time required to thoroughly wet the land by this method depends largely upon the character of the soil. The time required in Mr. LeGay's field, which is a medium loam, is six hours, the furrows being about 600 feet in length. On very heavy soil better results are secured if the furrows are 30 inches apart.

The alfalfa field is irrigated each month one week before cutting, which produces an extra heavy growth. Then when the hay is removed the ground is already wet and the alfalfa is up and growing without the loss of time in irrigating and the loss of water due to evaporation.

As the water from the furrows seeps to the alfalfa roots from the sides and beneath instead of being poured on top, this system gives practically 100 per cent efficiency in the utilization of water. The irrigation by furrow before the alfalfa is cut does not wet or damage the alfalfa leaves, saves a great amount of water and increases the tonnage of alfalfa.

Many of the farmers in Elsinore Valley have tried out this system and found it successful, and others are adopting it. The alfalfa yield on Mr. LeGay's ranch for five cuttings this summer under this system has been eight and one-fourth tons per acre. One cutting alone produced two and one-third tons per acre by actual weight. Pretty good, isn't it?

Field Notes from the Live Stock Men

Jean du Luth Coronet 52816, a three year old heifer owned by Jean du Luth Farm, Duluth, Minnesota, recently completed a record of 12603.9 pounds of milk and 580.61 pounds of butter fat and carried a calf nine months of her testing period. This performance entitles her to first place in Class EE. Among her winnings in the show circuit are first prize at the Minnesota State Fair, while on the advanced register test; first prize and silver cup for two year old at the Waterloo Dairy Cattle Congress in 1916; and first prize in the three-day butter contest for two year old Guernseys at the Illinois State Fair.

Another fine Guernsey comes to California, Edgemoor Farm purchasing Pencoyd's Golden May Secret 39626. The announced price is $10,000. The previous high record for a Guernsey bull was reached at the Combination Sale of Guernseys, near Chicago, on May 16, 1918, when Don Diavolo of Linda Vista 23565 sold for $10,000. Pencoyd's Golden May Secret 39626 was sired by Langwater Pencoyd 21830 and is out of Nella Jay 4th 38233, which holds third place in Class A with a record of 20,709.9 pounds of milk and 1019.25 pounds of butter fat. She also holds eighth place in the three and one-half year old division with 16,039.9 pounds of milk and 769.33 pounds of butter fat; and third place among the junior two year olds with 14,772.7 pounds of milk and 726.32 pounds of butter fat.

Linden Girl of Harbor Hill 3rd 58625 has recently completed a record in Class CC of 15,032.9 pounds of milk and 785.89 pounds of butter fat. This record not only places her at the head of her class, but it also entitles her to become the champion cow of the breed in this new maternity class. On March 8 she had to her credit 15,769.9 pounds of milk and 830.16 pounds of butter fat and had carried a calf 249 days. This production would have placed her in Class C.

CHOOSING A BREED

The question, "Which is the best breed of swine?" cannot be answered by naming any one breed. Some breeds are superior to others in certain respects, and one breed may be better adapted than another to certain local conditions. In general, the "best" hog is the one the farmer likes best, provided it is what his market demands. He will not make a mistake, however, if he makes a selection from the breeds already established in his locality. This is a matter which the farmer will have to decide for himself.

After the farmer has decided upon the breed of hogs which he believes to be the best and most profitable for him to raise, he should stick to that breed and endeavor to develop it to its highest possible standard. It is impossible to get the most out of swine breeding by continually changing from one breed to another. There is adequate room and market for the different breeds of hogs, but it would not be profitable for one individual to try to raise several and bring them to perfection. Farmers' Bulletin 765, United States Department Agriculture, Washington, D. C., gives information on breeds, types, conformation.—W. E. Schneider, University of Arizona.

How to Make Home Made Cheddar Cheese

THERE is a more than usual interest in home methods of cheese making at this time. Here are directions for making cheddar cheese as given by an Australian cheese expert, G. C. Sawers, of Victoria, in the Journal of Agriculture.

For making a small quantity of milk into cheddar cheese, the following articles are required: A wooden tub (or a jacketed vat) with movable cover, a long-bladed knife, cheese moulds, cheese press, thermometer, curd rake, one ounce and a six ounce measure glass.

When both the evening and the following morning's milk is to be used in the one operation, it is advisable to cool the evening milk (early after milking) by standing it over night in cold water.

Stir this milk occasionally till bedtime.

In the morning (before the morning's milk has been added) skim the evening's milk.

Add the starter to the skim milk (one ounce to every ten gallons).

Heat the cream (by standing in hot water) to about 80 degrees Fahrenheit and remix with the milk in the vat, stirring thoroughly.

Add the uncooled morning's milk. (When mixed the temperatures of the whole milk in the vat should be 84 degrees to 86 degrees Fahrenheit.)

If colored cheese is desired coloring should be added and stirred gently for two or three minutes—a quarter or half-teaspoon to every ten gallons.

Now ascertain by the following test whether the milk is ready for the rennet: The milk in the vat should be about 85 degrees of temperature. Take four ounces of the milk in a cup and float a tiny wooden chip (bit of wooden match) on the milk; noting the position of the second hand on a watch add one drachm of rennet; stir immediately for ten seconds; then withdraw the spoon and note carefully the time of coagulation. (Coagulation is indicated by the chip becoming stationary.) If coagulation occurs 18 to 20 seconds after the introduction of the rennet, the milk is ready for renneting without delay. If a longer time elapses the milk is not yet ripe enough and some delay is necessary.

Assuming the test shows the milk to be ripe, note the time and add the rennet — about one-half ounce for every 100 pounds. (The amount of rnnet is important, but as different milks vary in their curd content and different kinds of rennet vary in strength, the exact amount can only be arrived at by experience.) The rennet, before adding, should be diluted—20 parts to one with clean cold water.

Stir the milk for three to five minutes after adding the rennet, and watch for the milk coagulating. When this occurs, carefully note the time, because the time which elapses between the adding of the rennet and the setting of the curd is the best guide when to cut the curd. (Coagulation should occur in 12 to 14 minutes.)

As soon as the milk shows the first indication of thickening, and time has been noted, place canvas cover over the vat.

The number of minutes which the the milk took to curdle should be multiplied by 2½, and the number of minutes in the result is the time to be allowed between coagulation and cutting. Thus, if it took 12 minutes to thicken, it should be ready for cutting 30 minutes after. At this stage the curd should split clean in front of the thermometer when inserted diagonally.

Cut with a long-bladed knife in strips one-fourth inch apart lengthways. Then do the same crossways, so that the surface appears cut into one-fourth inch squares. Uniform cutting is important. After cuttting allow the curd to settle to the bottom of the tub for a few minutes, but dip off a portion of the whey and scald it up to 140 degrees Fahrenheit.

Stir the curd gently by hand for 10 to 15 minutes before applying the rake.

Add a little hot whey.

Stir gently with rake and add whey every 15 minutes, increasing the quantity of each application. While stirring continuously, the hot whey should gradually be raising the temperature required, viz., 96 degrees Fahrenheit in warm weather, or 102 degrees in cold weather, and this should be reached 40 to 45 minutes after stirring commenced.

Except during an occasional stir to prevent consolidation, it should be now left covered up with the canvas to maintain the temperature (96-102 degrees) till it is time to run off the whey. This is ascertained by the hot iron test, as follows: Heat a piece of iron rod or pipe, not red, but hot enough to make water sizzle when dropped on it. Take some curd in the hand and squeeze tightly to press out the whey. Gently apply the iron rod to this curd for a few seconds and lift

Prize Winning Berkshires

Two High Class Jr. Boars, choice $65.00. Six Fall Boars, choice $50.00.
Sired by Ames Rival.

F. P. Hall • Perris, Cal.

slowly away, observing while doing so the adhesive properties of the curd. If the curd adheres to the iron, and draws out in short fine silky threads one-eighth inch long, it is at the right stage for running off some of the whey (enough to expose the curd). With good milk the first whey is usually run off two and a half to three hours after the adding of the rennet. If curd is not ready for dewheying in three hours, a faulty cheese is almost certain to result. If ready earlier than two and a half hours, a pasty cheese may be expected. The remainder of the whey may be drained off when another test of the hot iron produces threads one-fourth inch long.

Gather the curd six to eight inches deep, and tilt the vat for hetter drainage. Allow the curd to remain so stacked to become solidified (this process is called matting) for a quarter of an hour, when it should be cut to its full depth, lengthways and across, into junks about nine inches by four, and turned completely over. Repeat the turning every quarter of an hour, the temperature being maintained evenly—94 to 96 degrees—until the curd becomes tough or meaty, usually about two hours after the stacking. (The frequent turning insures even drainage and uniform color.) Again apply the hot iron test to the curd, and threads should draw out three-fourths to one inch long. If this occurs, the curd is ripe for milling.

Milling may be done, with small quantities, with an ordinary carving knife, with which cut the junks into cubes of one-half inch dimensions. It should then be stirred every quarter of an hour, but always cover when not stirring, as the heat should be maintained at about 95 degrees.

One hour from milling apply the hot iron test again. If curd pulls out in threads 1½ inches it is ready for salting. At this stage the curd assumes a peculiar velvety feeling, and when compressed in the hand exudes moisture composed of equal parts of whey and butter fat. Salt at rate of about four ounces per ten gallons of milk, but add only half the amount at one time, and stir thoroughly before adding the remainder. Mix well and leave curd massed up for 15 minutes. During the process of salting the temperature may be permitted to fall, and at completion should be 84 degrees.

Pack the curd firmly into the mould, in which cheese cloth has been inserted. When filled, lap the cloth over the ends. Put wooden follower on top and place in press. Apply pressure gradually until whey ceases to escape. Then remove cheese from mould, lift loose ends of cloth from top, draw out the wrinkles, and insert disk of muslin on top. Lap loose ends over again and place back in press. Gradually increase pressure until late at night, when it may be left. Remove cheese from mould next morning, and place in storing room, where temperature should not exceed 60 degrees. Stand on clean shelf, and turn over daily for two months, at which time it will be ready for use.

A Few Sheep on Every Farm

THE San Joaquin County farm bureau has inaugurated a campaign to increase mutton and wool production and suggests in its Monthly that the need for increased sheep production is very apparent, since the United States is producing less than one-half of the wool consumed in this country, and the demand is being further increased for use of the army and navy. Wool supplies which have normally reached the United States are now being used in other countries. As the size of our army increases the needs of the government for wool will increase, and a serious shortage of wool in this country seems inevitable. The farmers who maintain a flock of sheep will not only have an opportunity for a considerable profit, but will be rendering a distinct service to the country.

Sheep raising in California has largely been confined to large flocks, comparatively few sheep being raised in smaller flocks on ordinary farms. As a matter of fact, a small flock of sheep is a valuable additon to almost any farm. Sheep will utilize weeds and waste about the fields, fence corners, orchards, irrigation ditches, etc. They require very little hand feeding, suhsisting mainly on grass and other forage and can well be run with other stock. They return two cash crops yearly; namely, wool and lambs, and are also valuable from the standpoint of fertility of the soil.

Feed conditions in California this year are such that it seems that some of the large flocks of sheep must be slaughtered this fall. If these sheep could he placed in smaller flocks on farms it would not only result in better agriculture in the state, but would be a distinct service to supplying wool and mutton in this time of need. In view of the foregoing facts, it seems advisable to inaugurate a campaign to encourage the keeping of a small flock of sheep on many farms in California where sheep are not kept. The division of animal husbandry of the College of Agriculture is willing to supply information regarding the best methods to pursue in handling such a flock of sheep, and to assist in securing sheep from the ranges or other places and distributing them on farms. The farm bureau furnishes an organization through which this information can be disseminated and farmers encouraged to secure and keep a flock of sheep.

The division of animal husbandry will furnish information regarding the mutton and wool situation, and where sheep may be secured, and will assist to the extent of purchasing large bands of sheep to be distributed in small flocks among farmers, if such procedure is necessary. In such a case each farmer ordering sheep will deposit a fund in his local hank sufficient to cover cost of sheep ordered, this fund to be drawn upon by the directors' committee of the farm bureau when sheep are delivered. There shall be no charge for services on the part of any memher of the staff of the college of agriculture, and no profit shall be derived from the handling of sheep. Where it is possible for farmers to purchase direct from owners of flocks, the financial transaction shall be direct between purchaser and original owner.

Committees will be appointed in each farm bureau center to list all farmers not now keeping sheep, who are interested in securing a flock of sheep and desire to secure sheep this summer or fall. If you have sheep for sale or desire to huy sheep, let the farm hureau act as a clearing house of information.

Increase the world's ration by growing more breadstuff and eating less.

DR. HESS DIP and DISINFECTANT

A Dip that is standardized, of uniform strength and GUARANTEED. One gallon makes 70 gallons of dipping solution.

For Scab, Ticks and Skin Troubles

DOGS

For Sale—Airedale pups. Pedigreed. The best all-round dogs. Whelped June 17. R. E. McCoy, Terra Bella, California.

RABBIT MEAT

Suggestions by the food administration that hare and rabbit are suitable substitutes for the meats needed for export have added to the general interest in these little animals. Rabbits and hares vary considerably in the quality of meat, depending largely on breed and age. Those raised primarily for meat are the Belgian, New Zealand, Flemish and similar varieties. The meat is of good flavor, practically all lean and is prepared in the same manner as chicken. In Europe rabbits and hares are staple foods.

Barreled Pippins are selling in New York at from $8.00 to $10 per barrel; boxes are running $2.50 to $4.00. Winesaps are commanding from $2.50 to $3.50 per box; Black Twig and Ben Davis, $2.50 to $4.00.

Italy has published a decree requisitioning 1918 crops of wheat, barley and rye.

Why Not an Egg Day?

Written for California Cultivator By Jean A. Koethen

WE HAVE had orange day and raisin day and who knows how many other days on which the virtues of this or that product was advertised, but I have seen no suggestion as yet of an egg day. We have eaten oranges and raisins and figs and dates at the behest of those who had them to sell, but we have not offered them our own special brand of food in return. And yet our own is the best. The egg has every other kind of food, with the single exception of milk, pushed clear off the map when it comes to real solid, satisfying qualities. Along with milk it claims respect and consideration as a perfect food.

This suggestion is not meant to be facetious. Why not have an egg day, when every householder, small and great, young and old, sick or well, shall be exhorted to eat eggs. No one is too old, and few too young, hardly any one too feeble, and only a few bumptious folk too robust for eggs. They are the universal as well as the perfect food.

We have been forced to save meat and conserve wheat and go without sugar, but, glory be, no one ever needs to go without an egg if he has the money to pay for it. The supply will always keep pace with the demand. There are plenty of poultrymen now in Southern California who would be delighted to hatch more pullets that would lay more eggs if only they were sure of getting the cost of feed back plus a trifling profit. Isn't it silly and stupid to kill the hen that lays the golden egg, or what amounts to exactly the same thing, to let the poultryman send her to market because we are not willing to pay five cents apiece for a splendid food product that is actually worth double that amount.

Because our grandmothers fed their hens on the waste grain of the farm and sold the eggs for ten cents a dozen, a good many otherwise sensible Americans have gotten the idea that that is all eggs are worth. We pay 60 cents a pound for bacon and 60 cents a pound for butter but we raise a howl of protest when we are asked to pay 60 cents a dozen for eggs that weigh quite or nearly a pound and a half to the dozen. We pay from 40 to 50 cents for almost any kind of meat sufficient to serve four persons, when two eggs apiece cost not to exceed 40 cents and supply ample animal food for the meal.

The one objection to eggs as a substitute for meat seems to be that they do not quite take its place in the diet of robust, hard working men, and to a limited extent this is a real objection. But even an outdoor worker does not need meat every day, and there is a multitude of persons of sedentary employment that would be vastly better off if they ate eggs instead of meat four days out of seven. Another objection which formerly had weight is, that eggs are more troublesome to serve, but since so many cooks have been on the hunt for ways of serving meat substitutes they have discovered so many new ways of using eggs that you may have your eggs served in a different style for every meal in the week if you wish.

Eggs have always been recognized as the best food for children and invalids (always excepting milk). As our boys who have been wounded at the front come home to recuperate, the first thing they will ask for is eggs. That is the first thing they think of now when a present from home gives them a little extra to spend. Eggs they must have, and we dare not permit the number of eggs in our Sunny California to be diminished further. If we do, they will cost a good deal more than five cents apiece. Five cents apiece the year round will enable most poultrymen to hold on in spite of almost prohibitive prices. Many are holding on now at a loss. Let us do the square thing by the poultry industry and the boys who need eggs and boost for the little white hen and the eggs she lays.

Compulsory Candling of Eggs

REPORTS now being received by the United States food administration from egg producing sections indicate that the practice of compulsory candling is resulting in improved quality. Since June 1, all egg buyers in the United States have been included under a system of licensing which requires that all eggs be candled at time of purchase and that bad eggs be rejected.

Although in the past the importance of candling has been repeatedly pointed out, the practice has been for the most part a voluntary matter among country egg buyers. As the result producers who sold eggs of poor or doubtful quality received as much for them as was paid in the same locality for the fresh, first-quality product—an obvious injustice and no incentive toward improvement in quality.

The general level of prices to producers was consequently depressed in order to make up for the losses from bad eggs which had little or no market value.

Experience during the summer months of the past five years shows that about 25 per cent of all eggs were a total loss and 40 per cent materially depreciated in food value. The food administration has considered such conditions lead to a vicious waste, and the system of compulsory candling now in force places every lot of eggs offered for sale on its own merits. Handling large quantities of eggs which must be discarded as unfit for food is furthermore a needless burden on the railroads and all who deal in eggs.

Every receiver of eggs (including hucksters) must now candle all eggs carefully and include an egg candling certificate bearing his license number with every case of eggs passed on to the next handler. Wasteful practices in the distributing trade are also prohibited and wherever possible eggs should be kept at a temperature below 60 degrees.

Although penalties are provided for violation of these orders the food administration relies principally on voluntary effort and the support of the people in carrying the regulations into effect. Farmers are asked to bear in mind that rotten eggs feed nobody and that any attempts at marketing such eggs clog distribution and help only the enemy. One Missouri egg dealer reports an unusually high quality of eggs this season, stating that they bring within one cent of the top of the market, whereas in former years they brought three or four cents below the top. This experience is typical of many and shows that an improved quality sold under regulated conditions brings additional returns as well as being a direct contribution to the world's egg basket, which must be kept full.

The food administration's specific request to producers is to offer for sale eggs known to be fresh and to support the general plan of paying for eggs on the basis of quality, thus insuring justice to all.

EGG LAYING CONTEST

Storrs, Connecticut, August 1, 1918. Report for the 39th week ending July 31, 1918.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 1559; Tom J. Adamson, 1496; Richard Allen, 1495.

White Wyandottes

Obed G. Knight, 1656; Brayman Farm, 1435; F. W. Harris, 1410.

Rhode Island Reds

Richard Allen, 1542; Pinecrest Orchards, 1402; Pequot Poultry Farm, 1273.

White Leghorns

Hollywood Farm, 1556; J. O. LeFevre, 1554; Braeside Poultry Farm, 1554; Oak Hill Estate, 1520.

Miscellaneous

Oregon Agricultural College (Oregons), 1707; H. P. Cloyes (Buff Wyandottes), 1406; Cook & Porter (Buff Wyandottes), 1349.

POULTRY AND RABBIT SHOW

A combined poultry, rabbit and pigeon show will be held at Oakland, October 1-6, in connection with the Pacific Coast Land and Industrial Exposition.

War savings stamps and cash prizes will supplant the time honored trophies and cups, in view of war conditions and the exhibits will be recruited from as far East as Minnesota, as far south as New Mexico and north to the Canadian border.

The show will be held under the auspices of the Alameda County Poultry Association, C. G. Hinds, secretary; California Pigeon Club, W. J. Head, secretary; Pacific Coast Rabbit and Cavy Breeders' Association, Walter Hickling, secretary. The judges are: Poultry, W. S. Russell, L. W. Potts; pigeon, W. D. DeLong, H. Maltester, I. Weeks; rabbit, Arthur Petty and Louis Regner.

Eggs all through the MOULT!
SHORTEN the moult and lengthen the laying. Globe A-1 Mash (dry buttermilk added) will do it. The live lactic acid bacilli in the dry buttermilk will keep your flock in glowing health: (bulletin 162 U. S. Agr. Exp. Sta., Berkeley).
For Hogs A-1 Hog Feed 10% dry buttermilk) will save from $6 to $12 on fattening each hog.

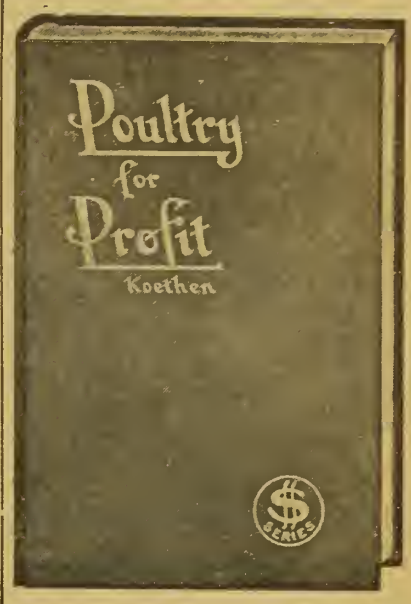
Poultry can be made to Pay



THERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe.

SMILE

When your nerves are all a-jar
Try to smile;
When you straphang in a car,
Try to smile;
When the war news isn't bright,
And the streets are dark at night,
And your last man's gone to fight,
Try a smile!

You can't change the thing, of course
With a smile,
But it does not make it worse
If you smile;
And it seems to help your case,
For it brightens up the place;
For it somehow rests your face
Just to smile!
—Edinburgh Rotary Bulletin

GREAT GRANDFATHER'S BROADAXE

By C. A. Stephens in Youth's Companion

WE KNOW that our broadaxe is at least a hundred and thirty years old, for it was among the tools that my great grandfather brought with him from Reading, Massachusetts, when he came to Maine at the end of the Revolutionary War.

Probably it is much older, for it was made in Sheffield, England, and was brought to America in the brig Constant some little time before the colonies rebelled. It has the "dew lip" and other Sheffield marks and rings clear as a bell when you flip the blade.

No tool ever had a busier life. It hewed much of the square timber for the buildings at the old home farm and also the timber for the houses and barns of the neighboring pioneers. For the first 10 or 15 years it was the only broadaxe in the settlement, and whenever anyone had any hewing to do he borrowed it.

It was lost repeatedly, but always turned up. Once it was ploughed under, but was ploughed out the next year, and had to have a new handle. Once, too, it was buried under autumn leaves for an entire winter; and it also went through a barn fire without apparent damage to its fine temper.

When great grandfather died, the old broadaxe passed into the keeping of his son, the old squire. When, as a boy of 12, I first saw the axe, it was badly rusted; it had had ten successive handles, each of hickory or oak, with the side crook for hewing to the line. Handles came and handles went, along with their human handlers, but that old Sheffield axe hewed on; and oh, what a keen edge it would take from a hard grindstone or emery stick; a soft stone would not "touch" it. You could grind all day and wear out the stone, but not that axe. Like all early English axes, it had been a heavy one, but was now worn up nearly two inches. Yet that matchless temper was as prime as ever. It was almost impossible to dull it on dry pine knots or even on nails; it would cut off a nail and show scarcely a trace on the edge.

Even in 1866, when we young folks went home to live at the old farm, the neighbors still borrowed the axe whenever they were building a new barn, house or shed. The old squire always lent it to any and all who wanted to borrow it. Indeed, when we wanted the axe ourselves we generally had to scour the countryside for it. Sometimes it would be gone from the farm for a year at a stretch, since whoever had borrowed it would lend it to others.

Once, I remember, after tracing it from farm to farm, we had to drive to an adjoining town to recover it; and on another occasion we found the axe at an iron foundry where some unappreciative borrower had sold it as old junk.

After that experience we young folks held an indignation meeting and declared that the old axe should not be lent again to anyone on any pretext. We meant to put it away in the attic along with the flax wheel, loom, tin baker and other mementos of our ancestors. For a year or two Addison and Theodora had been deeply interested in collecting family souvenirs; the big attic at the farmhouse had come to be a repository for antiquated articles.

However, we knew that the old squire would never refuse to lend tools to a neighbor, and so Addison proposed that we buy a broadaxe and keep it on purpose to lend. That we did. But the very first time that we lent the new axe it came home with two wide, deep nicks broken out of the blade—spoiled, in fact.

Less than two months after that we had to lend the old broadaxe again, much to the disgust of Addison and Theodore, who had made a bracket for it on a beam in the attic, next to the old queen's arm that great grandfather had carried at Bunker Hill. That happened in the spring. May Day was drawing near, and Theodora and Addison thought of a plan for keeping the old axe at home in the future.

On that day, in our community, we always exchanged May baskets and other compliments of the season with our neighbors. Now, my cousins proposed to leave on May Day morning, on the doorsteps of each of the four principal borrowers of tools at the old squire's, a brand-new broadaxe.

They did not mean it as an ill-natured joke, nor did they have the least notion of stirring up a commotion in our neighborhood. In fact, they thought they were quite generous, for they were rather put to it to scrape enough money together to pay for the axes.

Under cover of darkness on May Day eve, Addison and Theodora left the axes on the doorsteps of our four neighbors—the Murches, the Sylvesters, the Wilburs and the Batchelders. On the wrapper of each axe Theodora had written:

"We hope that this new axe will prove as useful to you as the old one that you have so often borrowed."

It was merely a joke, but never was a joke worse received. Those kind neighbors felt themselves insulted. Indignation reigned from the moment they read the inscription and undid those packages! And it was perfectly obvious to them where the axes came from.

"Ruth," the old squire said to grandmother at the supper table the next evening, "do you know of anything that we have said or done to offend the Murches?"

"Surely not," Grandmother Ruth replied. "Why?"

The old gentleman stared at her reflectively for a moment before he answered. "Well," he said at length, "perhaps I am mistaken. But this afternoon when I drove down past their place, from the mills, Murch was out in his garden near the road, and I pulled up to pass the time of day. He hardly replied, and when I went on to speak of the weather he gave a short laugh and walked off without responding. I thought it a little strange and wondered what had come over him that he should act so."

Wholly unable to throw light on the subject, grandmother merely said, "Perhaps he wasn't feeling well."

The Cultivator Patterns

8937—Ladies' Shirtwaist. Cut in sizes 36, 38, 40, 42 and 44 inches bust measure. The V-neck is finished with a narrow roll collar of white.

8954—Girls' Dress. Cut in sizes 4, 6, 8 and 10 years. The dress has a two piece skirt.

8962—Ladies' One Piece House Dress. Cut in sizes 36, 40 and 44 inches bust measure. The dress buttons from neck to hem.

8947—Ladies' Waist. Cut in sizes 36, 38, 40 inches bust measure. The waist is all in one piece, with full length kimona sleeves.

8965—Boys' Dutch Suit. Cut in sizes 2, 4 and 6 years. The separate straight trousers are buttoned to the waist through a band.

8930—Ladies' House Dress. Cut in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. The drese can be quickly put on, for it fastens like a coat, in double-breasted style.

8967—Ladies' Two Gored Gathered Skirt. Cut in sizes 24, 26, 28, 30, 32 and 34 inches waist measure. The back gore is gathered across the slightly raised waistline.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
CALIFORNIA CULTIVATOR
Los Angeles.

"Maybe," the old squire replied doubtfully, and the matter was dropped; but I noticed that Theodora and Addison looked uneasy.

The next morning there was much greater need of explanation. When the old squire, who was an early riser, opened the front door, there lay three heavy packages—three of those broadaxes that the recipients had secretly and no douht scornfully returned during the night.

"We seem to have had a mysterious present of broadaxes last night," the old squire remarked at the breakfast table. "Can anyone explain it?"

Addison glanced at Theodora, and, concealment now being worse than useless, they immediately entered on a labored explanation of the whole affair. The old squire listened with a whimsical, not wholly pleased, smile, but made no comment. Theodora and Addison soon excused themselves; and before the rest of us had left the table, we saw Theodora hastening through the yard outside. She had put on her hat and evidently intended to make a hurried visit to the neighbors.

It must have heen a disagreeable experience; but she and Addison had resolved to exonerate the old squire and grandmother.

"What did you say to them?" I asked her afterwards.

"Oh, I told them it was just a May Day prank, that we hadn't intended to injure their feelings, and that grandfather and grandmother knew nothing about it."

"And what did they say?" I quizzed.

"They didn't say much, if anything," Theodora said, with a wry smile.

But the neighbors overlooked the incident, and soon good feeling prevailed again. I should hardly have remembered the incident except for a call I received about a week ago from Charlie Sylvester, a youthful neighbor.

"I'm going down to Bath to work in the shipyards," he announced. "The government wants carpenters for the new ships, to beat the U-boats. I know how to handle tools a little, and I guess I can- help get those ships ready. I'm going tomorrow. And father says you've got an old broadaxe that was a keen cutter. Would you let me take it and grind it up, to hew with?"

"Certainly!" I exclaimed. "That or anything else I have that will help in this great emergency."

So that old Sheffield axe, which has served so many generations, is now at a Bath shipyard—still hewing, doing its "bit" to beat the German submarines.

SCOUT RALLY SONG

(Tune of "Keep the Home Fires Burning.")

Scouts have heard the call for Freemen
To go forth and crush the Hun.
On the fields of France in battle,
They will fight till Vict'ry's won.
Scouts at home, we must not falter,
"Carry On" and do your share,
Put your shoulder 'neath the burden,
Help to feed Scouts "Over There."

Chorus:

Keep the Scout Troop going
While the "Big Job's" growing
Taking thousands from our ranks
Away from home.
Gone to fight for Freedom,
Scouts will help to feed them,
Digging gardens, selling bonds,
Till our boys come home.

—A. H. Broido, in Boy's Life, the Boy Scouts' Magazine.

An officer at Spartanburg has been court martialed and dismissed from the army for bullying his men. No wonder the Teutonic officers despise an army where mere privates have rights which officers are bound to respect.

Food

A SHELFFUL OF RELISHES

Home made sauces from home grown fruits and vegetables are first aids in serving cold meats or stretching the roasts. Every well stored pantry should have its shelf of relishes; chutney to serve with chicken, corn relish with fish, cucumber catsup with steak, spiced grapes or currants with cold meats.

Apple Catsup

One quart apple sauce, one teaspoon ginger, one teaspoon cinnamon, one teaspoon cloves, one pint vinegar, one teaspoon pepper, one teaspoon mustard, one teaspoon onion extract, two teaspoons salt.

Simmer slowly until thick, bottle and seal. A similar catsup can be made from plums or grapes, and spiced to taste. Sorghum or molasses may be added if a sweet sauce is liked.

Cucumber Catsup

One dozen large cucumbers, one quart vinegar, one tablespoon salt, one-fourth teaspoon cayenne.

Gather cucumbers before the sun strikes them and keep in a cool place until used. Peel and grate the cucumbers and drain off the water. Heat vinegar and spices to boiling point; pour at once over the grated cucumber, bottle and seal. Cucumbers bottled in this way retain their freshness and make a particularly good sauce for steak.

Spiced Currants

Five quarts currants, one pint vinegar, one and one-half pounds sugar, one and one-half pounds corn syrup, one teaspoon cloves, one teaspoon cinnamon, one teaspoon allspice.

Combine ingredients and cook one hour. Seal in jars.

Indian Chutney

Two dozen ripe tomatoes medium size chopped, six onions medium size chopped, three red peppers chopped, three green peppers chopped, one dozen tart apples chopped, one pound seedless raisins, one cup celery cut fine, two quarts vinegar, one and one-half cups sugar, one and one-half cups corn syrup, salt.

Combine the ingredients and cook until all are soft and the chutney is thick. Pour into hot sterile jars and seal them.

Corn Relish

Five pints sweet corn cut from cob, three green sweet peppers, two red sweet peppers, four pints vinegar, four pints finely chopped cabbage, one-half pound sugar, one-half pound corn syrup, one-fourth pound mustard, two tablespoons salt.

Seed and chop peppers. Mix all ingredients together and cook until corn is soft, about 25 minutes. Seal air tight in hot, clean jar. Serve with

DISTRACTIONS

"Why do you always dine where there's an orchestra?"

"As a matter of precaution. Sometimes the music helps me to forget the food, and sometimes the food helps me to forget the music."

NATURAL RESULT

"Well, is your war garden coming up to the scratch?"

"No, but my neighbors' chickens are."

THIS OLD, SAFE, COMPLETE BANK IS AT YOUR DOOR

Thousands of people in Southern California use the facilities of this Bank, through the mail.

It costs 10 cents car fare and takes an hour or more to come to the Bank from most of Los Angeles. It costs only 2 or 3 cents and takes only a few moments to transact the same business through the mail, from any distance. Just as convenient, just as safe, very expeditious.

WRITE TODAY and ask for the book, "Banking by Mail." Establish a connection with the Oldest Savings Bank, the Largest Bank of any Sort, and the Most Complete Bank, in every department, in all the Southwest.

HAY

Under date of August 10, Scott, Magner & Miller says:

Receipts past week, 2509 tons. The market has been heavily stocked throughout the week, demand has been exceedingly light and it has been only with the greatest of difficulty that the arrivals have been removed from the tracks. There has been no export trade to speak of for some time, which, together with the light demand from interior sections as well as the Coast districts, tends to make it difficult to handle the receipts to advantage. Considerable alfalfa has arrived during the week from the river districts as well as from the interior. Owing to the high range of prices demanded on this commodity movement is slow. It is reported, however, that owing to lack of water in many districts and trouble with the grasshopper pest in others that the later cuttings of alfalfa are liable to be short of former estimates. Straw seldom appears on the market, there being practically no demand whatever in the city for it. Some straw has been purchased in country districts for feeding purposes but in most cases at a very low range of prices.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:

Fancy Wheat Hay (large 5 wire bale) .....26.00@27.00

Citrus Fruit Market

Los Angeles, August 14, 1918.

Oranges have shown poor keeping quality which has caused some sales at low prices but good fruit has commanded long prices.

The terrific heat of the Eastern portion of the country has caused lemons to go to exceptionally high prices. Pittsburg especially has given long prices reaching from $10.00-$13.00.

Shipments

Shipments of citrus fruits to date since November 1, 1917: Southern California; oranges 12,851 cars, lemons, 4849, total 17,700. To same date last season, oranges 35,762, lemons 7147, total 42,909. Central California this season; oranges 2536, lemons 115, total 2650. Last season to same date; oranges 4665, lemons, 164, total 4819. Northern California; oranges 203, last year same date 845.

AT THE AUCTIONS

August 7

New York: 8 oranges, 1 grapefruit, 2 lemons. Market strong and higher. Val. 6.90-9.70, lem. 4.70-7.40, Nav. 7.15, grapefruit 2.85-6.15.

Philadelphia: 4 cars. Val. 4.85-7.65, lem. 4.95.

St. Louis: 1 Val. 2 lem. Val. 7.15-8.30, lem. 7.35-8.05.

Boston: 3 oranges, 1 lem. Val. 3.90-8.25, lem. 7.35-7.90.

August 8

New York: 6 Val., 1 lem. Val. 6.40-9.50, lem. 5.80-6.65.

Boston: 4 cars. Val. 6.75-8.15, lem. 6.50-7.45.

Philadelphia: 2 cars. Val. 5.75-8.40.

August 9

New York: 19 oranges, 1 grapefruit, 1 lem. Val. 4.15-9.40, lem. 7.20-7.55, grapefruit 3.60-6.10.

St. Louis: 1 orange, 3 lem., 8 Val., 8.40, lem. 7.35-8.00.

Cleveland: 1 mixed car, 1 lem. Val. poor condition. Val. 5.95-6.20, lem. 6.35-7.55.

August 12

New York: 16 oranges, 3 lem. Val. 5.00-9.85, lem. 6.05-8.05.

Cincinnati: 1 orange, 2 lem. Val. 6.55-7.50, lem. 8.00-8.50.

Boston: 3 oranges, 1 lem. Val. 7.35-8.15, lem. 3.00-7.45.

St. Louis: 1 oranges, 4 lem. Val. 6.45-7.75, lem. 6.20-7.90.

Pittsburg: 2 oranges, 3 lem. Higher. Val. 6.20-8.40, lem. 10.00-12.05.

Philadelphia: 4 oranges, 2 lem. Val. 6.75-8.95, lem. 5.20-9.00.

August 13

New York: 11 oranges, 2 oranges and grapefruit. Val. 6.85-9.05, grapefruit 3.10-4.90.

Pittsburg: 2 lem. 9.35-13.00.

Boston: 2 oranges, 9 Val. 7.00-8.25.

Philadelphia: 2 oranges, 1 lem. Oranges higher, lemons lower. Val. 6.20-9.45, lem. 7.10-8.25.

MARKET NOTES

Bureau of Markets of the U. S. D. A. report conditions of canning in truck crops of California as follows: "Snap beans 90 per cent, cabbage 74 per cent, cucumbers 77, peas 70, tomatoes 90. In every case excepting cabbage and peas conditions in California are far more satisfactory than the average in the United States."

Los Angeles reports early crop of shipping tomatoes as much lighter this year than preceding year. Worms have been a serious factor in all tomato growing sections, causing a loss as high as 50 per cent in certain Earliana districts. In San Fernando Valley the blight has been serious.

Cauliflower transplanting especially of early varieties is under way in truck farms around Los Angeles. The planting will not be more than 65 per cent of last year.

The apricot season has closed with prices running much lower than have been satisfactory to the producers.

Remarkably fine red nectarines are coming in and command around six cents.

New Stockton Burbanks are selling at the Los Angeles market at $3.00, with White Rose running at $2.75 though exceptional quality sometimes demands $3.00.

Watsonville Red Astrachan and Alexanders and Sebastopol Gravensteins are commanding from $2.25-3.00 a box in Los Angeles market.

Yucaipa and Beaumont Delicious apple growers are contracting future delivery $1.15-1.25.

Fine large Elbertas from Central California are commanding $1.50-1.65 lug boxes.

High quality Sacramento River Bart-

letts are commanding $1.25-1.50 lugs, $3.00 packed box.

The United States food administration has issued a ruling that there shall be no trading in new crop of oriental beans until September 1.

Georgia peaches are practically all shipped and Eastern markets are depending on Texas and Arkansas Elbertas.

Colorado shipments of cantaloupes will be practically the same as last year.

California shipments of deciduous fruits to date are nearly 5000 cars.

The Apple Shippers' Association of America is meeting in Philadelphia this week.

The potato crop of the country is estimated this year at 405,000,000 bushels against 402,000,000 last year.

PARTIAL LIST CALIFORNIA FRUIT AND VEGETABLE SHIPMENTS

From post card reports to the Los Angeles branch of the bureau of markets, report is made of the following shipment of cars of products from California for the week ending August 12: Apples, 20; apricots, 22; cabbage, 6; cantaloupes, 253; casabas, 3; dried apricots, 13; dried beans, 40; dried potatoes, 3; dried prunes, 15; garlic, 6; grapes, 275; lettuce, 2; mixed berries, 16; mixed fruit, 82; mixed vegetables, 33; mixed fruit and vegetables, 48; mixed dried fruit, 2; nectarines, 4; onions, 59; peaches, 887; pears, 489; peppers, 3; plums, 322; potatoes, 167; raisins, 114; strawberries, 1; tomatoes, 23; watermelons, 129.

MAPLE SUGAR AND SYRUP PRODUCTION

The maple sugar crop of 1918 in the 13 states which include nearly all the producing region, was 13,270,900 pounds and the syrup production was 4,905,200 gallons. The total of sugar and syrup, counting one gallon of syrup as equivalent to eight pounds of sugar, would be 52,512,500 pounds of sugar. The production in 1917 was 10,838,650 pounds of sugar and 4,286,100 gallons of syrup, both being equivalent to 45,127,400 pounds of sugar. The 13 states covered by this report produced about 99 per cent of the total maple sugar and syrup in the census year, 1909.

The principal region of production extends from northwestern Ohio through New York to Vermont and includes parts of Maine, New Hampshire, Massachusetts and Pennsylvania. Outside of this region there is also production of importance in the mountain country beginning with the southern counties of Pennsylvania and extending through western Maryland into scattered localities in West Virginia; also in parts of Michigan, Wisconsin and Indiana.

The increased demand and higher prices for maple sugar and syrup helped to cause a larger number of trees to be tapped in 1918 than in 1917, or even in 1909. A total of 19,298,200 trees were tapped in 1918, of which 15,616,000, or 81 per cent, were in the four states of Vermont, New York, Ohio and Pennsylvania.

Weather conditions in the northern part of the sugar region, namely, in New England, New York, Pennsylvania and Michigan, were favorable. There were cold nights alternating with warmer days. In Maine, however, snow delayed the beginning of the sugar making season, while in Michigan the season also was rather short. In New York, however, conditions were reported as ideal for a good flow and a high quality of sap. In Ohio and Indiana the season was relatively long, but there was not enough alternating of freezing nights with thawing days for the best conditions of sap flow either as to quantity or as to quality.

C. P. CLAUSEN TO ATTEND OFFICER'S SCHOOL

It will be of considerable interest to friends of C. P. Clausen to know that he has been designated to attend the training school for officers of the coast artillery. Clausen seems to have been a marked man in his company. Though only enlisted ten days, he was highly commended by his commanding officer for general appearance of self and outfit. After a month he was advanced to corporal. At the end of the second month he, with another member of the company, were picked as fit subjects for officers of artillery, and have been sent to Fortress Monroe, Virginia, for training. Three members of the staff of the insectary division are now with the colors and all have either received or are in line for commissions.

U. S. GRAIN STORAGE CAPACITY

That country elevators provide more than half of the nation's total grain storage capacity is shown by investigations of the United States food administration into facilities for taking care of this season's crops. The amount and distribution of grain storage in the United States is indicated in the following summary: Country elevators, 20,642, 527,861,855 bushels capacity; additional country elevators, 959, capacity not known; terminal elevators, 399, 250,708,060 bushels capacity; mills, 6961, 150,177,939 bushels capacity. Total, 28,962, 928, 747,854 bushels capacity.

Cities having a total storage capacity exceeding 100,000,000 bushels are Minneapolis, Chicago, Kansas City and Philadelphia. It will be observed that the grain storage units of the United States have a capacity equivalent to more than nine bushels for every person. These facts and the knowledge that there are additional storage facilities on farms show the practicability of building up grain reserves, especially of wheat, against future food needs. The food administration also plans to build up grain reserves in France in order to render less serious any temporary interruption of shipping.

ITALY COMMANDEERS LABOR FOR FARMS

To prevent losses of food likely to occur during the harvest season through lack of farm labor, Italy has issued a decree of far-reaching scope. The following classes are subject to be called for work on farms during the harvesting and threshing season:

Citizens of both sexes, between the ages of 15 and 65 who are cultivators of land or agricultural laborers and who in addition to working their own land can be of help on land belonging to others.

Persons accustomed to agricultural work even if they have abandoned such work within the last five years.

Persons who though not accustomed to agricultural labor are physically fit for such work or being out of work are considered capable to undertake it.

The foresight which Italy has shown in solving her agricultural problems is an additional example of the recognized importance of ample food for maintaining the strength of the nation and winning the war.

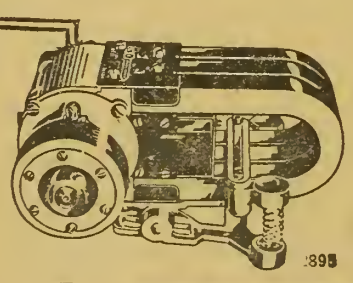
IN selecting a lighting system, you want powerful, steady light—instantly available without complicated electrical devices to maintain and give trouble.

With a K-W Lighting Outfit there is *no* storage battery to sulphate or short circuit or need weekly attention, whether you are using your lights or not. There is *no* commutator or brushes to burn out—*no* complicated cut-out to go wrong, *no* delicate ammeter or voltmeter to watch or become inaccurate through jolts and jars. The K-W *needs no* attention except for an occasional oiling. There is *no* upkeep expense.

A trouble proof, low tension K-W Magneto or generator furnishes the current. Voltage and current output is automatically regulated without governor or other device. The three bar generator furnishes current for a trouble light and two 1600 candle power headlights; the four bar generator for two 2000 candle power headlights and trouble lamp.

The K-W Lighting Outfit consists of a generator, two parabolic headlights, wire, switch, bulbs and trouble lamp. It can be belt or friction driven and is provided with mounting to fit *every* tractor.

The K-W Lighting Outfit gives a steady, powerful light, at a moment's notice, when engine is running. Should you ever require light at any other time, a hand flash lamp will give you all the light required. Surely you don't want to put up with a lot of complicated regulating devices, storage batteries, delicate meters, etc., for such an occasion. Remember, with a K-W there is no maintenance expense.



Write today for further details, prices, etc., giving make and model of your tractor.

Holding Up the Nation's Defense

The telephone played a tremendous part in this Nation's mobilization for war. It continues vital to the Government's program.

At the same time it has remained at the service of the whole people whose demands upon it grow apace with that of the Government.

The public is entitled to the best service that it is possible to render. But the public has a partnership in the responsibility for good telephone service.

It takes three to make any telephone connection: the person calling, the company, and the person called. Without the cooperation of all three the service suffers.

The telephone company can make the connection, but no words can be heard at one end of the line which are not properly spoken into the transmitter at the other. The relation between the speaker and the hearer is the same as the relation between the orator and his audience. It cannot be maintained if the orator turns his back to the listeners or if the audience is inattentive.

Telephone traffic must be kept moving. Speak distinctly—answer promptly—and release the line as quickly as possible. Don't continue reading when the bell rings.

These seem little things to ask the individual telephone subscriber, but when the individual is multiplied by millions all over this country, it is easy to see how important it is that *all* should cooperate.

Some Folks at the State Fair

A Simplified Tractor Operated Like an Automobile is Entirely Practicable for a Woman to Handle

As IN England, the tendency is growing in this country for women to help make up the deficiency in farm labor. They can do so to very great advantage where a machine like the YUBA tractor is employed. It is so simple and easy to operate, so seldom needs repairs, so responsive to the turn of the wheel that women are finding it suitable to their strength.

The YUBA 12-20 does the work of twelve horses. One woman can save the labor of several men, using the tractor. Farm labor decreases a half where a tractor is used instead of horses. There's less cooking, less housework, less chores to do where the tractor is used. It is a healthy occupation, and a most profitable one.

YUBA model 12-20 tractors are ready for immediate shipment. They are ready for your fall plowing, for discing, for hauling, for any work where power is needed.

YUBA 12-20 tractors are made of the qualities of steel that give long service under all kinds of conditions; all kinds of weather; 24 hours a day. They furnish the power, all you need is to direct.

The cost of construction is increasing. It may be necessary to raise the price. *Order now.*

Yuba Manufacturing Company

Marysville, California

Tractor Models: 12-20, 20-35, 40-70 Pump Models: For all Farm Purposes

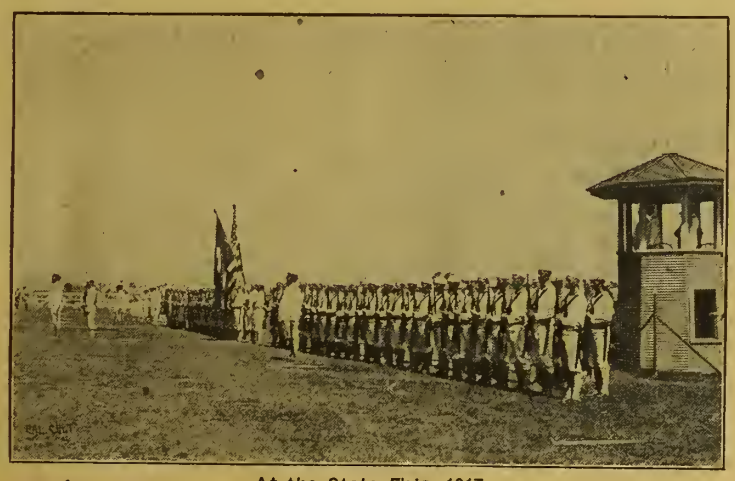
Greater Premiums for Genuine Farm Exhibits

By A. Layman

"TO HOLD or not to hold" an agricultural fair is a question which has concerned many a community in view of the fact that the war has created problems so numerous. One of these problems has been that of greater production, and some communities have felt that the greater production could be secured through centering directly on production. Others have felt the need of more education, of learning best methods of work, of inspiring to that work to the limit, and have argued that that inspiration could be secured in no way more satisfactorily than through an agricultural fair. More communities have accepted the latter belief, and we think there will be more fairs held this year than in any preceding year. In any case, California has taken this position and will hold a greater state fair than ever, and the southern end of the state is making an effort to practically equal the state fair at Sacramento. It has been years since Los Angeles has held what was at one time known as the Sixth District Fair, though it has maintained grounds which are admirably situated for a great fair.



At the State Fair, 1917
Jackies at drill in front of grand stand.

But our first fair is that of the state, which will be held in Sacramento, August 31 to September 8.

California's first state fair was held in San Francisco, October 4, 1854. The next was held in Sacramento, 1855. The '56 fair was held in San Jose; the '57 fair in Stockton; the '58 fair in Marysville; the '59 and all subsequent fairs at Sacramento. The premiums at the first fair totalled $4660; those offered for the coming, 1918, fair will be $45,000 and in addition $22,500 appropriated for the races. This will be the first state fair held under the presidency of George C. Roeding of Fresno. The president for the past three years has been John M. Perry of Stockton.

In looking over the list of state fairs, the premiums and racing purses offered, there are a number of interesting items developed. Until 1873 no record is given of racing purses. The premium lists up to that time aggregated not to exceed $10,000 in any one year. In 1873, however, the premium list was $8,925 and the racing purses, $14,200. Both these amounts were increased up to 1892 when the premium list had reached $17,106, racing, $29,950. Then came a decline in premiums and a material increase in the amount for racing. This resulted by 1900 in a premium list of $9768, while there was appropriated for racing $38,745. The first year in which the premium list became greater than the appropriation for racing was in 1910. That year only $14,465 was appropriated for premiums and only $6,930 for racing.

In Tractor and Implement Tent
The display of tractors this year will be greater than ever. Over 60 are already scheduled.

Under the presidency of A. L. Scott racing was again encouraged, and in 1911 and until the fair of 1914 general agriculture was not so generously treated. In 1915 there was no fair held because of the Exposition. The last two years agriculture has been given its rightful place, and, while there is still racing, it does not dominate as it did at one time.

During the past few years there has been question as to whether the live stock interests or the farm power and implement interests were increasing with greater rapidity in occupying the attention of fair attendants. Tractors, especially, have made a strong bid for favor, one year hodling demonstrations on space immediately adjoining the fair grounds. At last' year's fair there was given only a still exhibit, but there were tractors of practically every make used on the Pacific Coast. The California Tractormen's Association promises that the coming exhibit of tractors, farm implements and labor saving machinery will surpass any similar exhibit west of the Rockies.

There will be several events of particular interest to live stock people, especially to dairymen. One feature which always creates greatest interest is the butter scoring contest. There will also be milking contests and a large exhibit of all dairy products and appliances in the reenforced concrete dairy building erected at large expense some three years ago.

Regarding the tractor features Secretary Paine writes: Tentative plans called for the parade to take place on the race track in front of the grandstand during the early part of fair week, but a change as to place may be ordered if it is found that the huge wheels of the heavy machines are liable to seriously mar the smoothness of the track's surface. In that event, the drives through the grounds probably will be utilized to stage the spectacle.

Everything from the small garden tractor, driven by a motorcycle engine and weighing less than 100 pounds, to the mighty 75 horsepower 14 ton leviathan, capable of doing the work of 40 horses in plowing up 60 or 70 acres of bean, rice or grain field in a day's time, will participate in the parade. Some will be of the one wheel type of drive, others will be two wheel, three wheel and four wheel machines while a few will have no wheels at all. These are operated on the track-laying principle of construction, which has been demonstrated so impressively by the work of the fighting tanks on the European battlefields.

More than 60 different makes of tractors will be exhibited at the State Fair this year and all will have place in the parade.

In the Counties Exhibits Tent
The tent which sufficed last year has given way to the $300,000 Horticultural Building

Early Morning on State Fair Grounds

Agricultural News Notes of the Pacific Coast

Northern California

A. L. Wisker, the Bartlett pear grower of Nevada County, has been conducting experiments in cross pollination of pears.

California flour mills are shipping flour to our army in France in sacks which will be filled with dirt and used for trench embankments.

Butte County has begun its harvest of almonds two weeks earlier than usual. The prune crop also is maturing early owing to a dry season.

Butte County's entire pack of fava beans has been sold in the East. It is expected that a large acreage will be planted to this bean in the district about Oroville this fall.

Northern California papers are appealing to water companies and to irrigators to concrete irrigation ditches wherever possible and conserve the limited quantity of water.

At the meeting of the Northern California Counties' Association at Weaverville, September 9-11, delegates will be present from San Francisco and from Oregon and Washington.

A party of 15 orchardists of El Dorado County with Farm Adviser Jones last week made a tour of inspection of packing houses at Newcastle and of pear orchards in Grass Valley.

The El Dorado County farm bureau is planning for a big picnic to be held the first week in October. The annual election of officers will be held at that time, and it is planned to have exhibits of livestock.

"Listeners in" on telephone lines were recently scored by Judge Finch of Glenn County. Complaint has been made that notice of grain fires has been delayed by people who cut in on the line through curiosity.

Central California

Offers of $40 for Tokays are being received by Lodi growers.

Thompson Seedless are meeting quick demand in Eastern markets.

The poultry association of Santa Cruz is conducting an egg laying contest.

Donald Penny has taken over the office of horticultural commissioner of Santa Cruz County.

The Associated Olive Growers has leased its plant at Lindsay to the Pacific Products Company.

Members of the Ceres Fig Growers' Association met last week to talk over marketing contracts.

The Madera Fruit Growers' Association is making large shipments of fresh fruits to Eastern centers.

Several cargos of flour have recently been shipped from California to the Allies via the Emergency Fleet.

Officers of the California Fruit Growers' Association were in Lindsay recently discussing with growers the new plan of turning cull oranges into marmalade.

Peach growers who had planned to sell their peach pits to Uncle Sam are informed that they will not be put to the expense of sacking but may deliver in bulk.

The destructive progress of the army worm in San Joaquin Valley vineyards was stopped by trenching. Deep furrows were plowed about the vineyards and the soil in them thoroughly pulverized.

Turlock cantaloupe growers have suffered seriously because of shortage of cars to take the melons out of the state. It has been necessary to market much of the crop in San Francisco with consequent lower prices.

Southern California

The fire lookout on Santiago Peak is a woman, Miss Winifred Hunter.

San Diego County increased its tomato acreage this year 500 per cent.

Oranges have been bringing unheard of prices in the Eastern markets.

Florida citrus growers are planning to put women into their packing houses.

The beet sugar factory at Oxnard will commence operation about August 20.

Buyers are said to be offering high prices for almonds, 22 cents for Nonpareil and 20 for I. X. L.

Large plantings of Valencias are being made in the Owensmouth district of the San Fernando Valley.

The government has contracted for 60 per cent of all the preaches handled by the Peach Growers' Association.

The apricot harvesting season was unprecedentedly short this year owing to hot weather maturing the fruit rapidly.

Apricot growers of the Hemet Valley state that the work of the Women's Land Army has been invaluable to them.

Nadeau Park, Los Angeles County, is sending out heavy shipments of tomatoes. One-third of the crop goes into local consumption.

There has been considerable dissatisfaction with the operating methods of the Poultry Producers' Association organized by the state market director and now a formal petition has been presented to Food Commissioner Cole in Los Angeles by poultrymen of Inglewood, Gardena and Burbank, asking that the association be dissolved.

The Coast and General

Florida's orange crop is estimated at 12,000 cars.

Soldier barracks are being erected at the Oregon Agricultural College at Corvallis.

The war trade board has prohibited importation of rice for domestic consumption.

The United States food administration has issued regulations for cotton ginning.

No big contracts for apples have so far been reported from the Wenatchee district of Washington.

The food administration has prohibited purchase of grain for malting purposes before October 1.

A campaign against grasshoppers in Harney Valley, Oregon, has just been successfully completed.

A pen of Oregons holds the honors for the last week of the International Egg Laying Contest at Storrs.

Surgeon-General Gorgas is laying comprehensive plans for the physical rehabilitation of disabled soldiers.

Georgia's peach crop this year was a record breaker. Over 8000 carloads have been shipped out of the state.

Flour and feed selling schedules for Pacific Coast mills have been announced by the food administration. The schedule covers prices of flour, bran, mixed feed, middlings, and shorts.

The problem of how to amuse the wounded soldiers who are unable to sit up has been solved in a simple manner by the Y. M. C. A. at the base hospitals in the camps. Portable motion picture machines are so stationed that the projections appear on the ceiling, and all the patient lying on his back need do is to look up.

Farm for Profit

and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

HAUSER PACKING COMPANY

Look Ahead

THE BASIS FOR ORCHARD PERFECTION CROW TREES TRADE MARK

Realize that RIGHT NOW is the best time in the history of our country for planting orchards. Not only must we win the war; we must supply Europe with fruit for many years to come as thousands of acres of her orchards have been totally destroyed.

Every year's delay in planting means the loss of a crop of fruit, so arrange to plant every acre possible this coming season; well cultivated summer crops between the trees will more than cover all costs.

Plant only the very best, most dependable trees to be had—John D. Rockefeller could not afford to plant any other kind.

Our stock of Fruit Trees is complete and extra fine in quality—better cannot be had anywhere at any price. Write at once for our Advance Price List, free upon request.

Crows' Nurseries - Gilroy, Calif.

"Out of Luck" is the Dairyman Without a Silo

By C. L. Hughes

IN A CERTAIN farm in California there stands a concrete silo, so alone that it attracted my attention many times as I drove past it. The only buildings on the place are a small shed for horses. One windy night as I was passing this place one of my rear wheels sank into an unnoticed bog at the edge of the road and it became necessary to go to this farm house for a team to pull me out, and the incident afforded an opportunity to satisfy my curiosity about that lonely silo. It seems that the owner does not own a single cow, but expects to some day, and the silo was erected as a safety first measure to solve the feed problem. That silo has now been full of good corn ensilage for more than two years, and still there is not a cow on the place, but when the dairy herd does come it will not suffer for the want of succulent feed.

When Fred W. Kiesel, owner of the beautiful Jane Garden Farm at Sacramento started to assemble his fine herd of registered Holsteins, the very first dairy structure that went up was a silo, and while barns, sheds, and corrals have since been built in plenty, the cattle were provided with good feed first, and good housing afterward.

The lonely silo waiting for two years to deliver its succulent contents to help increase our milk and butter production is of course an extreme case.

Mr. Kiesel's idea in building a silo first of all his dairy buildings is a rare case in California, and the more the writer observes feeding practice throughout the state the more does the idea seem to be rare—good business.

In your own neighborhood how many live stock farmers do you know who are falling short of success through the "high price of feed" or "shortage of feed"? How many men have you known to actually fail in live stock farming because of the lack of feed? Many men have so failed in most California communities.

The silo is the one great factor in California live stock feeding, next to alfalfa, and its place is becoming quite generally recognized by progressive live stock farmers throughout the state.

Most farms are capable of producing crops suitable for silage, such as corn, barley, oats, and some of the sorghums, and it is safe to say that any California farm incapable of producing a silage crop is unsuitable for successful live stock farming.

The best advertisement of a silo in any community is a silo, for once live stock farmers in a community have had an opportunity to observe the practical advantages in feeding silage it is not long until the landscape in that locality becomes well dotted with substantial silos.

The writer recently talked with a live dealer who had the agency last year for a well known silo, his territory covering two counties. Roughly he sold about $20,000 worth of silos in his two counties during 1917. This year his agency covers only one county yet his total sales in that one county for the first seven months of 1918 practically equal his entire sales in two counties during all of 1917.

Not long ago the writer visited the Lewis Moreing place in San Joaquin County. On this farm 260 cows are in milk and corn silage has a large place in their ration. There are four tile silos on the place, each with a capacity of 180 tons, while two more big ones each of 420 tons capacity have recently been constructed. The

The California Way of Making Silage

silo situation is very aptly summed up by J. S. Moore, superintendent of the Moreing farm who says, "The California dairyman who is trying to operate without a silo is out of luck."

NECESSITY FOR SILOS

I DO not see how any dairyman in California can produce milk under present conditions and make a living unless he makes the silo his principal reliance." This is the view taken of the necessity for silos as expressed by George E. Platt, life long dairyman and head of the Los Angeles Creamery. Mr. Platt has made a complete success of milk production and is today milking hundreds of cows. He says that to meet his requirements he finds nothing equal to oats for silage. Of course he does not secure the tonnage which may be had from Indian corn silage, but he takes the position that the cheapest way to secure grain concentrates is to grow oats until the grain is "coming into the dough." This gives quality and results.

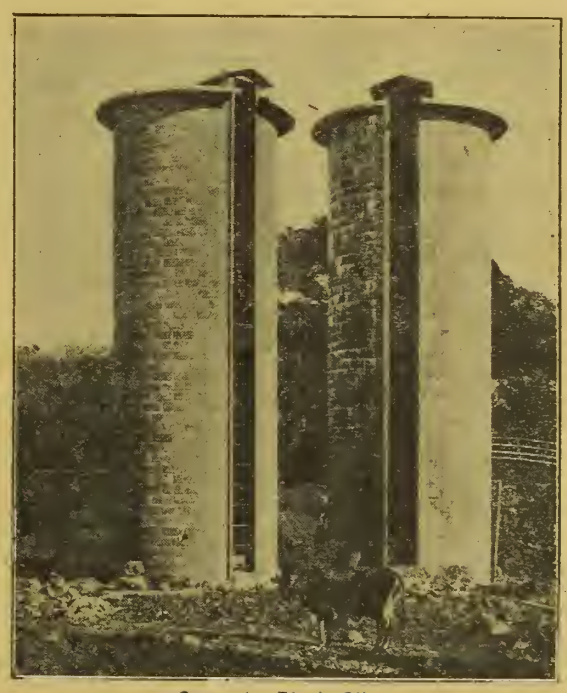
Better, with this crop planted in, say, the middle of November, siloed in February or March, the ground may then be fitted and a spring crop of Indian corn give a fall filling for silos from the same ground. Mr. Platt gives a suggestion, however, in the matter of packing such oat silage in the silo. He believes in keeping the surface "well cupped," or saucer shaped, and at all times be sure that tramping is well done around edges. This, especially, where a rank or strawy growth is secured. Wheat does not make a satisfactory silage.

In planting corn, plant far enough apart so as to secure "an ear to the stalk." Grain or high quality silage is the prime requisite. Then milk production at minimum purchasing of concentrates is possible.

The oats will produce perhaps ordinarily not more than eight tons, while corn will produce 15 or 20, possibly double that under abnormal conditions, but grown, as indicated above, two crops to the year, with milk sold at present prices, there are long possibilities in the feeding of silage.

On the other hand below is given an article by Mr. Coppini of Humboldt County, where conditions are different from those in other parts of the state. Again, another article by Frampton Bros., 600 miles away, and here again the silo has proved invaluable. Feeding problems today call for the use of the dairyman's head more than at any former time. Whether the dairyman uses natural pasturage, as does Mr. Coppini and secures satisfactory financial returns and in addition prizes for greatest and most economical production, or whether he uses silos as do Mr. Pratt, Frampton Bros. and hundreds more in this state, he must decide for himself.

Frampton Bros. Dairy, Los Angeles County
Note the silo and convenient feeding racks which make for most economical handling



Concrete Block Silos
Built by Jack London on his Glen Ellen Ranch. Mr. London built these in 1913, all construction being done on the ranch, even to using of his own rock crusher. Silos are 43 feet in height and 12 feet in diameter.

A SILO PAYS

Written for California Cultivator
By Frampton Brothers

FOUR years ago we were feeding our dairy herd a ration of alfalfa and dry beet pulp and decided that we were not getting the results that we should and that we would have to get cheaper feed or quit the dairy business. After investigating ensilage as an economic cow feed we erected two silos, each 14 feet inside diameter and 41 feet 6 inches high, both of solid reenforced concrete. The first year we had a wonderful crop of ensilage corn, more than filling the two silos from less than ten acres. The entire cost of our ensilage in the silo was but a little over one dollar and a half, and the saving in feed paid for both expensive monolithic concrete silos by the time they were empty. We cannot speak too strongly of the value to the farmer of a permanent reenforced concrete silo which insures him feed safe from fire, wind and vermin, cannot leak and preserves all the juices in the ensilage. So much has been said against concrete for silos that we want to state here publicly that we can find not the slightest effect of the ensilage on the concrete of our silos after four years of use.

An important part of the economy of ensilage is the raising of the corn. We bought Ross ensilage corn seed and have been selecting it for several years until now we have a corn well adapted to this climate and these conditions, of enormous yield and best suited for ensilage. This year we carefully prepared about ten acres by deep plowing and frequent dressing so that when we planted on June 5th there was a dry powdery, dust mulch of several inches on top and moisture below. Nine weeks after planting the corn averaged 12 feet high, which means it has to date made an average growth of over 2¼ inches per day. The rows are 40 inches apart and it

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cuitivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cuitivator when writing the advertiser.

THIS WEEK'S COVER

The state fair draws immense crowds, especially on days of spectacular events. The Cultivator camera was brought into play at the instant of the head-on collision last year and the tense situation is portrayed on the cover of this issue. The spectacular features this year will be more largely military. The management promises to us a great fair. The premium lists are larger than ever.

FOOD, FORAGE AND FOREST

The fields and ranges of California have never been protected from fire as during the past few months. Volunteer fire fighters have been organized in almost every town. As a result disastrous fires have never been fewer. Let us all knock on wood and make still more efficient these fire fighting organizations. It all helps to put the crimp in the Kaiser's plans.

COMPARATIVE VALUES

Making an exhibit at an agricultural fair sometimes results in an awful hard bump. We grant that sometimes the "judge doesn't know" or perhaps "he is bought" or "wished to curry favor with a rich or powerful exhibitor" though we will have to confess that as a rule none of these considerations influence. Quality counts and the blue ribbon is ordinarily where it belongs. But the best judge of all is the farmer who pays his four bits and walks amongst the exhibits with open eyes. He is able to see that his own steer or horse which on the ranch at home was the "finest on earth" has certain weak points when it is led out along side of stock selected from the world's aristocracy.

In other words, there is no better place for making comparison of real values than a state or district fair. The modern fair has developed the judge who gives the reason for his decisions. This proves wonderfully helpful to the live stock breeder who is open to education.

TRACTOR INFORMATION

The farmer who wants information as to tractors or the latest improved implements will attend the state fair and the tractor exhibit and demonstration at Sacramento or the tractor demonstration at Los Angeles. Two great events covering several days with wonderful educational possibilities.

Experts and the best qualified engaged in the industry will be present. Take advantage of both these occasions.

EAT HEADS AND TAILS

Because of America's self denial and her saving of 140,000,000 bushels of wheat Europe is not so hungry and perhaps it is not untrue that liberty has been preserved to the earth. Europe has done her share of rationing, however, and one feature is most hopeful; she is learning, as is America, the food value of cereals other than wheat. Her millers are securing higher extraction from all grains, and Indian corn, barley, rice and other grains are becoming more popular. Our meatless days are not so many as they were, but the food administration urges care, and also urges the eating of certain products, even at every meal. Amongst these are: Heads, tongues, tails, livers, hearts, tripe, feet, barrelled beef, potted beef, beef loaf, chili con carne and beef trimmings. Beef trimmings are made into sausage, bologna and frankfurters, which need not be conserved.

NEXT YEAR

Gifford Pinchot is joining in the campaign for a greater food program for next year. A careful look ahead assures us that next year's demand will be far greater and if we are not careful our production may be less. While an occasional drouthy streak or hot spell has been chronicled during the past few months, in the main the country over the weather has been favorable and immense food production in America has saved the world from famine.

For next year it is none too early to plan. Farmers must appreciate that in the northern hemisphere there is not one ounce of reserve grain. Notwithstanding the most wonderful food conservation campaign ever conducted, the food production campaign has been in no sense equal. The campaign for the crop of 1919 must be far better managed than that of 1918. Mr. Pinchot refers to the fact that almost invariably those managing the greater food production campaign have not understood the farmer nor the farmer's problems. Too often city people have said: "Let us know your labor needs and we will supply the help." Imagine the farmer saying to the banker, the merchant, the dentist: "Let us know your labor needs and we will supply the help." Yet few professions call for more specialized knowledge than does farming. It takes time to make a farmer, and if this fact could be appreciated by those who would take the farmer under their maternal wing, more helpful suggestions could be made.

This Week's War Notes

The United States has loaned to the Allies a total of $6,492,040,000..

July U boat sinkings aggregated 270,000 tons as against 534,839 July, '17.

The Allies have the Germans looking East and are kicking them in the West.

Crown Prince Ruprecht of Bavaria is at home in Munch while his army is retreating.

Liberty three and a halfs were quoted in New York August 17 at 100.60 with 101 asked.

Total casualties to American troops in France number 21,467; total deaths including 291 lost at sea, 8193.

Young men whose 21st birthday has occurred since June 5 are to register this week, Saturday, August 14.

Since the Allies' advance began on July 18 nearly 80,000 Germans and 1700 cannon have been captured.

The ordnance department recently placed an order with a Connecticut manufacturer for 2,000,000 mess knives at 10¾ cents each.

The number of Allied troops in northwestern Russia is increasing and advance has been made more than 100 miles south of Archangel.

It is now predicted that the new man power bill which will change the draft ages to from 18-45 will pass within a few days and be immediately signed.

English troops from Bagdad have marched across Persia and occupied Baku on the western side of the Caspian, around which lie extensive oil fields.

Spain has notified Germany that future sinkings of her vessels will result in Spanish confiscation of corresponding tonnage of German interned shipping.

Rice riots are spreading to all parts of the Japanese empire and troops called to quell disturbances have killed many of the people. War contracts have made the large manufacturers and the wealthy more wealthy and caused such suffering on the part of the poor who were underpaid that a serious condition confronts the nation.

The retirement of the Germans has been almost continuous from the northern line in Flanders to south of Rheims. American troops along the Vesle, have proved strong support for the French. The most remarkable work of the week on the part of the Yanks has been the heavy artillery fire, which is becoming most effective.

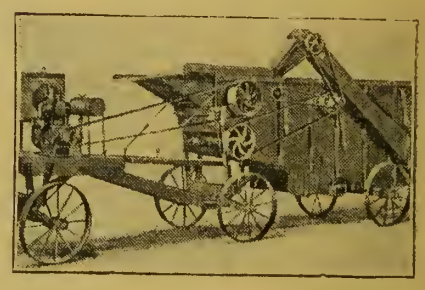
In giving instruction to railway employes, Director General McAdoo insists that there shall be courtesy shown at all times and adds: "Uncle Sam is running the railroads now. 'The public be damned' policy will in no case be tolerated on any road under government control."

The eastern Siberian situation is becoming more interesting. The number of Japanese troops has increased greatly, and because of Bolshevik threats against the Chinese and attack on Manchuria the Chinese army is approaching the frontier from the south. The Czecho-Slovak control the territory about Vladivostock, also have a strong force west of Lake Baikal, but between these it is known there is a large number of German prisoners who have been armed, and also Bolshevik. The third transport carrying American troops to Vladivostock has landed.

"New Supreme Government" has been organized in north Russia and Archangel proclaimed the headquarters or capital. The new government has issued a proclamation stating that the Bolshevik power has fallen and "The Supreme Government of the Northern Territory" will undertake to reestablish a single all-Russian national government by cooperation between various territories. It will defend the north and the entire nation against insolent onslaughts against Russian territory, independence and inhabitants made by Germany, Finland or other enemy countries; guarantee laboring classes land they are by right entitled to and defend the rights of labor, and overcome existing famine. The government asks the support of all classes which treasure the above objects and asks for friendly assistance of the people of England, America, France and others.

Aemrican automobile manufacturers have pledged themselves to restrict their output of passenger automobiles to 50 per cent, but the war industries board has urged that by January 1 every automobile manufactory in the United States be on a 100 per cent war basis.

Owens-Cushman Combination Bean Thresher



Cushman 8 hp. double cylinder motor connected to 20-in.-32-in. Owens Bean Thresher.

Owens Bean Threshers made in six sizes from the largest to the smallest size, embody the essential features necessary to thresh all varieties of Peas and Beans direct from the vines without spiitting the seed.

—They have more separating space and capacity than any other machine on the market.

—If you need a Pea or Bean Thresher at all get an "Owens." Write or wire at once.

—They are the Standard the world over. Built in sizes to suit any size grower, from the smallest to the largest, and there are none better at any price. Send for Free Catalogue.

Review of Present Bean Crop

THE farmers of this state need have no fear about an overproduction of beans this year, and a consequent depression of prices, according to Geo. A. Turner, president of the California Bean Growers' Association. His forecast is based not only on the reports of the United States bureau of crop estimates, but on individual reports received by the statistical department of the California Bean Growers' Association from its hundreds of members, among whom are the owners and managers of practically all of the big bean ranches in northern and central California. It is the practice of the association to obtain the fullest possible information at all critical periods of the crop season and to disseminate this information through the press of the bean districts.

Mr. Turner finds that the acreage planted to beans this year is slightly larger than in 1917, but dry weather conditions in many sections have materially interfered with the crop. Many growers report almost a total failure because of lack of moisture. Large whites, for instance, show at the present time an average condition in the counties of San Joaquin, Yuba and Colusa, but in Sacramento, Stanislaus and Yolo, they are reported below normal. While the outlook for pinks is encouraging in the most important districts where they are grown, the acreage is much less than last year and subnormal conditions ranging from 75 per cent down to 25 per cent are reported from some of the dry sections. Red Kidneys and Red Mexicans, which are grown largely in Stanislaus County, are reported to be about 75 per cent of normal. Black Eyes and Teparies, which are planted usually in the dry districts and are not easily affected by drought, range from 75 per cent to 100 per cent of normal.

It is particularly gratifying to note that the reports from the United States bureau of crop estimates check very closely with the reports received by the statistical department of the California Bean Growers' Association, direct from its grower members.

Mr. Turner calls attention to the fact that there is a wide difference between a normal crop and the crop of 1917. Last year the production went much above the average per acre and even a 90 per cent of normal production this year would be far below last year's output. Besides, fresh reports from Michigan, Oregon and other competitive bean sections, suggest that this year's production may be much less than usual on account of frosts, pests and other adverse conditions.

Mr. Turner is especially pleased with the splendid way in which the bean growers of California have responded this year to the government's appeal that they do everything possible to increase the food supply. Although the prices at planting time were not encouraging and though the growers anticipated great difficulties this year in securing labor, even at advanced prices, they planted freely and in large acreages. The United States food administration recognizes this response to the country's patriotic appeal and is doing its utmost to see that the growers get a living price for their beans. It is of course far too early to forecast the range of this year's prices, but the growers will undoubtedly receive a price that will compensate them for their decreased production in a period when all farming operations are carried on with increasing difficulties and expense.

The California Bean Growers' Association includes in its membership practically all of the large bean ranches and hundreds of smaller growers all the way from Salinas northward. It is the largest bean association in the world and will this year market many millions of dollars worth of beans. Its offices are in Stockton.

Sorghum Grain for Human Food

Ever since grain sorghum crops were first grown in the dry land West they have been used to some extent for human food. Ground at the local gristmill, they have been turned into batter cakes in the farm kitchen on many a winter's morn. In the making of corn bread or johnnycake they have taken the place of corn meal with satisfaction to the consumer. The grain also may be used successfully for pop corn.

Only in recent years, however, have scientific tests been made to determine their value in the human diet. The results of these experiments show that the meal of kafir and milo is comparable with corn meal. It can be used alone or in mixture with wheat flour in varying proportions in such ways as corn meal is used.

Owing to the absence of gluten in the protein, grain sorghum flour can not be used alone for making raised bread. It should not be ground into flour, therefore, but into meal instead. In this form it can be used for pancakes, bread, mush, puddings, etc., just as corn meal is used.

The use of kafir as human food has been discussed in Farmers' Bulletin 559. The following statements concerning it are quoted from that bulltin:

Since kafir resembles corn closely in composition and nutritive value, it is unnecessary to treat of these subjects in detail here. Something, however, must be said about special precaution necessary in preparing it for the table. In making mush for use alone, or as a foundation for other dishes (yeast bread, gingerbread, etc.), the ingredients should be thoroughly mixed before being heated. Cooking should always be more thorough than for Indian corn. In making gingerbread with corn meal, for example, it has been found sufficient to heat the meal and water for ten minutes in a double boiler; but in making the same dish with kafir meal it is necessary to cook the mush at least half an hour.

Government Regulates Cotton Gins

The United States food administration has issued regulations applying to all cotton ginners:

No licensee owning, controlling or operating a ginnery shall make any unreasonable charge for the service of cleaning seed cotton or separating the seed from the lint.

Ginners are to keep a correct record showing the name and address of each party for whom they gin cotton, the amount of cotton ginned in each case, and the actual charge made for such service. They must be in position at all times to furnish detailed information to the United States food administration.

It is necessary that ginners perform this service in such a way that the seed cotton shall be cleaned and the lint removed from the seed in an efficient manner. Such foreign substances as are removed from the seed cotton shall not be returned to the seed, but the seed shall be kept in a clean condition. Ginners are not permitted to mix any foreign material with cotton seed during the time that it is under their control or in their possession.

The charge for ginning shall be the same whether or not the cotton or the cotton seed is purchased by the ginner.

Ginners are to gin as rapidly as possible, consistent with good work, all dry seed cotton tendered them, and upon demand they are to return to the owner the cotton and cotton seed ginned by them. If cotton seed is purchased by the ginner, he must be guided by our rule No. 5 and circular No. 40.

Ginners are to keep a careful record, showing the name and address of each party from whom they purchase cotton seed, together with the quantity and price paid for same.

Anyway, you may buy and use all the salt you want. And it is easier to get along without sugar than salt, when you come to think about it.—Tulare Register.

The One Big Tractor Demonstration Begins September 17th

OVER 150,000 VISITORS EXPECTED

The Third Annual Tractor Demonstration

will be the biggest and most elaborate exhibition of Farm Machinery and Tractors ever held in America. Over one million dollars worth of Farm Machinery, Implements and Accessories will be on display in tents covering over sixty acres. Fifty or more sizes and types of tractors will be in operation, providing the best possible opportunity to inspect and judge tractor work on the farm.

The Dates—September 17, 18, 19, 20, 21

The Place—Whittier Boulevard

Half-mile East of Los Angeles City Limits

Orchard Prunings Make Humus

Written for California Cultivator By J. Eliot Coit, Los Angeles Farm Advisor

NOW since the ruling of the state food administration has limited the amount of humus forming materials available to the orchardist, growers should be interested in every possible source of humus which may be available. In this connection it may be well to mention prunings of trees both citrus and deciduous. On certain of the larger ranches where the owners have sufficient acreage to justify it a gasoline driven cutter is owned and operated. These cutters are drawn through the orchards after the pruners and quickly reduce the prunings to one inch lengths or less. A good cutter will handle matter up to one inch in diameter with comparative ease, especially if it is cut while still green.

One of the principal reasons why this practice has not been common in small orchards is because of the difficulty of owning and operating the cutters. I wish therefore, to make the suggestion that professional pruners who contract for the pruning of orchards be encouraged to own and operate brush cutters in addition. They could prune a small orchard and immediately cut up the prunings, and in this way the expense of the cutter would be distributed over a large enough acreage to make it easily available to all growers.

Pruners, however, can hardly be expected to buy these machines on their own initiative, but if growers generally will create a demand for this work no doubt it can be taken care of. The prunings of lemond orchards in particular may be expected to yield appreciable quantities of a fair quality of humus, and this source should not be neglected in these times of stress,

The Revolution of Farming

Written for California Cultivator By Arnold E. Needham

BETTER farming with its increased profits goes hand in hand with the use of modern machinery and implements. It is not the number of acres planted that determines the famer's yield and income, but the manner in which his acres are farmed. During the past few years improved farm machinery and implements have practically revolutionized the farming industry. Of the factors contributing to this revolution, the tractor has been the most potent.

There was a time, not many years ago, when the farmer was very skep-

Every Type of Tractor is to be Seen

tical as to the benefits derived from the use of a farm tractor. And well he might be for many of the tractors designed at that time fell far short of their manufacturers' claims. Even today the tractor admits of further development. It has advanced however to a stage where it is a most pronounced commercial success. Where once the farmer came to scoff, he now comes with serious intent. He investigates, examines and studies, prompted not so much by a spirit of criticism as by a desire to secure the tractor best suited to meet his needs. In other words, the question of today is not "Shall I buy a tractor" but rather "Which tractor shall I buy?"

This change in attitude has arisen as a result of the amazing strides made in the development and improvement of the tractor. The uses to which a tractor may be put at this time seem to be limited only by the mechanical ingenuity of the owner.

Formerly the tractor appealed to the farmer mainly as an instrument for pulling his plow. Now he uses his tractor for almost everything except the preparation of his meals. He not only plows, disks and harrows his soil, using his tractor as motive power, but he cuts his ensilage, saws his wood, pumps his water, digs his ditches, grades his roads, reclaims his overgrown land, and even at times moves his house or barn by means of this same power.

In other words, the tractor has become the "Man of all work" on the farm. It performs its tasks more economically and better than they could be performed by any other power, and more expeditiously.

From the farmer's standpoint it has also many advantages other than these.

The tractor's work is not handicapped by heat or cold. It can, if necessary, work day and night without ceasing. It does not grow fatigued. It works as effectively when the light is failing as when the dawn arises. It does not require any large outlay for its housing, nor does it need daily care and feeding when not in operation. Its requirements, even when in active employment, do not draw upon the food supplies now so essential to feed ourselves and our Allies. It reduces the demand for labor, and, as a result, the labor shortage has few terrors for the owner of a tractor. Its use permits advantage being taken of the most seasonable and effective times for performing the farmer's work and enables him to gather his crop when fully matured with the minimum of loss.

When a tractor is used the farmer can plow more acres and do it better. His cultivation is also more thorough, and consequently he not only produces more per acre, but secures a product of better quality at less cost.

As a matter of fact so many and varied are the tasks now performed by the tractor, with greater efficiency and more economically than any other farm power, that it has become the

One of the Big Ones

pivot around which the activities of the farm revolve.

Even the government has awakened to the realization that greater food production, absolutely vital at this time, depends in large measure on the wider use of tractors, and in accordance with this realization, is putting forth efforts through the Food Administration and other Government agencies, to assist farmers to secure tractors.

Many of our states have already purchased tractors and have put them to use either under contract or by sale on long term payments.

Our European Allies are securing tractors as fast as our facilities will permit their shipment, and already hundreds are at work in England, France and Italy.

A recent vacancy in the position of superintendent of the southern branch insectary caused by the resignation of Charles Perrin to enter the army, has been filled by the appointment of H. M. Armitage, formerly county horticultural commissioner of San Diego.

Estimate of Fruit Crops

Under date of August 12 George P. Weldon of the state horticultural commission sends out estimates in percentage of normal, of various fruit crops, compiled from reports of county horticultural commissioners and U. S. crop reporters:

Almonds

Alameda County 35 per cent of normal, Colusa 80, Contra Costa 70, Merced 90, Riverside 100, Sacramento 90, San Joaquin 60, Solano 60, Stanislaus 80, Sutter 60, Yolo 50.

Apples

Humboldt County 85 per cent of normal crop, Los Angeles 90, Monterey 80, San Bernardino 90, Santa Cruz 80, Sonoma 80.

Apricots

Alameda County 90 per cent of normal crop, Los Angeles 90, Orange 60, Riverside 65, San Benito 105, San Bernardino 50, San Joaquin 70, Santa Clara 100, Santa Cruz 90, Ventura 55, Yolo 40.

Figs

Butte County, Colusa, Fresno, Madera, Merced, San Joaquin, Stanislaus, Tulare, Yolo and Yuba all show 100 per cent crop, Los Angeles and Sutter 90.

Grapes

Butte County, El Dorado, Imperial, Kern, Lake, Madera, Marin, Merced, Nevada, Riverside, San Diego, San Joaquin, Santa Barbara and Yolo show 100 per cent crop, Kings, Monterey, Stanislaus and Tulare 110, Alameda 75, Contra Costa 85, Fresno 95, Los Angeles 85, Mendocino 90, Placer 90, Sacramento 95, San Bernardino 80, Santa Clara 80, Santa Cruz 65, Shasta 75, Solano 90, Sonoma 95, Sutter 70, Tehama 50, Yuba 80.

Olives

Butte County 55 per cent of normal crop, Fresno 70, Los Angeles 80, Madera 55, Riverside 50, Sacramento 60, San Bernardino 75, San Diego 100, San Joaquin 75, Santa Barbara 90, Sonoma 90, Tehama 75, Tulare 65, Yolo 50, Yuba 90.

Peaches

Butte County 70 per cent of normal crop, Fresno 70, Kings 90, Los Angeles 85, Merced 80, Placer 75, San Bernardino 60, San Joaquin 75, Santa Clara 80, Solano 80, Stanislaus 70, Sutter 75, Tehama 80, Tulare 65, Yolo 75.

Pears

Alameda County 80 per cent of normal crop, Contra Costa 65, Los Angeles 85, Napa 60, Placer 90, Sacramento 95, San Joaquin 90, Santa Clara 90, Solano 50, Sonoma 80, Yolo 85, Yuba 110.

Plums

Los Angeles County 80 per cent of normal crop, Placer 75, Sacramento 75, San Joaquin 80, Santa Clara 70, Solano 75, Tulare 70, Yolo 70.

Prunes

Colusa County 85 per cent of normal, Kings 90, Napa 75, Santa Clara 65, Solano 40, Sonoma 80, Sutter 80, Tulare 60, Yolo 60.

Walnuts

Los Angeles County 80 per cent of normal crop, Orange 75, Santa Barbara 90, Ventura 90.

Navel Oranges

Butte County 40 per cent of normal crop. Los Angeles 80, Orange 85, Riverside 45, San Bernardino 45, Tulare 32, Ventura 95.

Valencias

Los Angeles County 90 per cent of normal crop, Orange 85, Riverside 80, San Bernardino 75, Tulare 55.

Lemons

Los Angeles County 95 per cent of normal crop, Orange 90, Riverside 70, San Bernardino 85, San Diego 85, Tulare 80, Ventura 120.

Grapefruit

Imperial County 100 per cent of normal crop, Los Angeles 80, Orange 90, Riverside 60, San Bernardino 90, San Diego 90, Tulare 80, Yolo 75.

The Care of Fruit Drying Plants

Here are some timely reminders to the dried fruit men of California. They come from New South Wales, Australia, where the drying season has been over for some time. They are published in the Fruit World of Australasia:

"Now that the sun drying of fruit has finished for this season, growers should see that their plant that has been used during the drying of the fruit is properly stored as far as possible under cover.

"The trays should be thoroughly cleansed, the rack cover, side and ground hessians folded, the dipping tins, picking boxes and buckets, and sweat boxes cleansed before storing.

"Dirty appliances mean dirty fruit, and nothing discolors a tray so quickly as putting it away dirty, as moulds grow quickly upon the juices that have been spilt from the fruit upon the trays during the drying operations. The spores of the moulds are shed and lodge in the cracks and rough surfaces of the trays. During the next drying period these spores are transferred to the fruit, and so soon as favorable conditions, such as damp weather, when the fruit has to be stacked, set in, germinate, and mouldy fruit is the result. True, even on clean trays under similar weather conditions, fruit sometimes moulds, but the danger of the produce deteriorating from this cause is not so great when clean trays are used.

"The fruit juices and dust are more easily removed at the end of the drying season than by stacking the trays away unwashed and cleaning them just before the next drying season opens.

"The fruit dryer has usually more time to spend upon the care of his plant at the end of the drying operations than he has at the commencement, so that the trays will doubtless be better attended to before storing than they will if left till the next season.

"The damaged boxes and trays should be sorted out and placed by themselves, and can be repaired during wet weather."

Powder for Soil Blasting

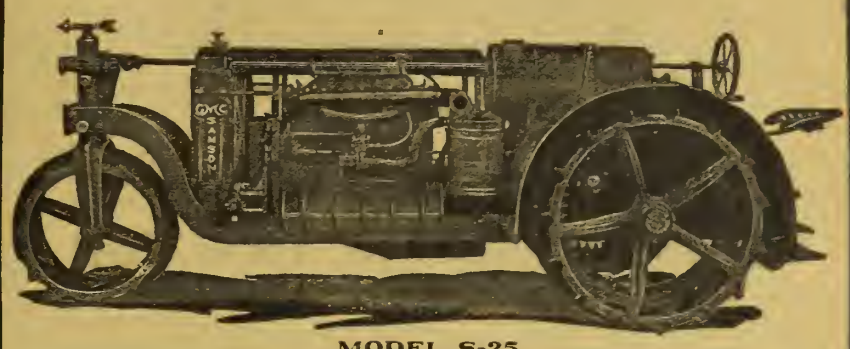
Fruit growers, gardeners and farmers who intend to subsoil their ground or who will have stumps to remove should bear in mind that there are great differences in the action of different explosives in the soil. Stumps can be taken out with almost any kind of powder, but some kinds pull the roots out cleaner than others and make smaller holes. Good results in tillage blasting cannot be secured at all with the wrong kind of powder.

The reason lies in the fact that some explosives are made so that they give a high velocity of detonation, while others give low velocity. These somewhat technical statements mean that some powders are quick and violent, tending to pulverize and grind to splinters or bits anything close to the charges, while others act more slowly and exert their force more as a push than as a grinding blow.

In tillage blasting the violent explosive is entirely out of place. Instead of lifting and breaking and crumbling a large area of soil, the effect is to compact the earth a little way from the charge and to make a cavity near it. The slower explosive, on the other hand, does not compact, but loosens and spreads its effect for yards about each charge.

Nitroglycerin dynamites and powders are of the violent class, even when of low percentage. Ammonia explosives are slower and are much better suited to soil blasting because of it. They do not lack in strength—it is the way they apply their strength that makes them better. As it happens the war has made nitroglycerin powders higher in price than

Allies in the Fight



MODEL S-25

SAMSON Sieve-Grip TRACTORS

GMC TRACTORS GMC TRACTORS

The "Sammies" at the front and the "Samsons" on the farm have proven their effectiveness. Both have been tried and found not wanting. Both are doing their parts successfully in their respective fields of effort. They are the result of careful selection approved by rigid tests.

In the "Sammie" is crystallized all the dominant features of the ideal soldier. In like measure, we believe that you will find embodied in the GMC Samson Sieve-Grip Tractor all the features of the ideal tractor,—simplicity, strength and endurance, coupled with economy in operation and ability to meet the most exacting demands day after day, fair weather or foul.

The GMC Samson Sieve-Grip Tractor stands on a sure foundation,—a record of nearly two decades of service.

It displaces ten horses on the farm and is adapted to countless uses, stationary and otherwise, for many of which horses are not suitable. All these labors it performs quicker, cheaper and better than any other power.

The strength of its working parts and its dust-proof motor assure long life and low up-keep costs. By reason of its simplicity, no skilled mechanic is required for its successful operation. Its steering device makes operation easy for the driver, without strain on the machine. Its lubricated Roller Pinions deliver maximum power to the drawbar with least friction loss.

Let us send you our latest booklet, "Better Farming."

ammonia, which is another reason for using the latter exclusively.

In blasting for trees it sometimes pays to use more than one charge in each tree bed and to fire them all together with an electric blasting machine. The combined explosions communicate one with another, and by reason of that give better execution. In stump blasting and in blasting ditches the electric machine is a necessity almost, as it cuts down the labor and time required. This method insures perfect detonation of all charges and permits the use of the same efficient ammonia explosives in stump removing and ditching that is found best for soil blasting.

What is a Rational System for Pruning the Valencia?

Written for California Cultivator By Robert W. Hodgson

CITRUS trees are usually pruned in California after the fruit has been picked or, in the case of lemons, at the time when they are carrying the least fruit. With the Valencia orange this means that pruning is done from May to November. The last few years have seen Valencia prices so satisfactory that it has been a considerable wrench for many growers to risk diminishing the amount of fruit by pruning. However, prices will probably not always be so high. The future must be looked to, and because the necessity for pruning for the maintenance of satisfactory trees has been a much debated question during the last few years the following discussion may be doubly apropos at the present time.

Sucker Growth Suppresses Fruit Buds

Typical Valencia sucker arising from good fruit wood. Notice how the fruit wood has been choked. We feel that suckers of this sort should be kept cut out.

The need for investigation in the field of citrus pruning is very great. Nobody realizes more keenly than the writer that as yet we know relatively little concerning this subject. It will take years spent in careful quantitative experimental work before we will be in a position to state positively that we know exactly what will be the results following certain systems of pruning. Moreover, when such facts are available, they will have to be interpreted with different citrus growing districts in the light of local conditions. However, growers have been experimenting with the pruning of Valencias now for a number of years. To be sure, much of it has been desultory and rather spasmodic; nevertheless, the experience obtained has at least been of considerable value in indicating certain results which can be largely attributed to the pruning practice followed. The writer is firmly of the belief that a discussion bringing together some of the ideas of our best citrus growers regarding this all important orchard operation has a distinct value, and this is one of the objects in mind in presenting this article.

One of the first questions arising in the minds of many California citrus growers is regarding the necessity or value of pruning. Does it pay to prune citrus trees is a question often asked at meetings of the growers. Lemon men are generally agreed that a certain amount of pruning is necessary in order to hold the rapidly growing lemon tree in shape to prevent it from breaking down under the weight of the fruit. This is especially necessary for windy sections. But orange men are not so well agreed. The navel grower frequently asserts that the only pruning his trees need consists in the taking out of cross or interfering limbs, dead brush, and lifting the lower branches off the ground, which after all is merely hygienic treatment such as any tree should receive. It must be admitted that there are many navel orchards treated in this manner that have been profitable bearers for years and are still in satisfactory shape. In fact, we should be ready to agree that of all citrus trees probably the Washington Navel does better with less pruning than any of the others.

But the case seems to be somewhat different with the Valencia. The habit of growth is quite different, being much less calculated to produce a strong framework capable of resisting the strains incident to the large crops borne. This is all the more important because of the larger average weight of fruit carried by the Valencia.

Moreover, examination of many of our older Valencia orange trees discloses the fact that they are going back. Although apparently well nourished and healthy, the crop is diminishing in quantity year by year, and in addition the sizes are getting smaller and smaller until in certain of the older orchards at the present time the percentage of marketable fruit is becoming alarmingly small. The limbs constituting the top of the tree seem to be deteriorating. This condition has caused a number of our orchardists to believe that the Valencia is relatively short-lived and that its period of maximum bearing is from 15 to 20 years, after which time it goes back. Some growers have even become convinced that renewing the trees by deheading is the proper procedure. These conclusions would seem well founded were it not for the fact there are numerous old Valencia trees which are not exhibiting this deterioration and continue to bear

Lots of Suckers and Unproductive Wood

A three year old Valencia tree allowed to grow naturally. It makes a large tree but not a strong one and the top is largely sucker wood.

satisfactory crops year after year. The conclusion cannot but be forced that a certain vigorous fast growing type of growth to which the Valencia is much given does not endure like the more slow growing kind of wood, but deteriorates after a certain period.

The Valencia does not seem so prone to give rise to sport limbs as the navel or to such a confusion of different kinds of wood as the lemon; nevertheless, it is extremely apt to produce a very rank vigorous sucker growth which if allowed to grow, carries the head of the tree too far from the ground, results in a very weak framework, and apparently deteriorates and becomes worthless after a few years of bearing. This type of growth bears large amounts of fruit even while relatively young as contrasted with sucker growth in the navel, and for that reason many growers rather encourage it. The fruit, however, is borne near the ends of the branches which then bend over and in turn give rise to the new sucker shoots which proceed to choke the parent limb beyond the point of origin of the new shoot. Such growth makes a very weak tree mechanically although it results in a tree large and vigorous looking for its age. The tendency is for the scaffold limbs to grow upward for several feet before branching, and this is repeated again and again until a very tall cylindrical tree results, much in contrast to the round, or ball-shaped navel. Valencia trees allowed to grow in this fashion require considerable propping when carrying the fruit in order to prevent the tree from breaking down.

Bearing these tendencies in mind a number of our most progressive growers are now pruning their Valencia trees to a habit of growth more like the navel. This is done by persistently keeping down all vigorous sucker growth, thus encouraging the development of the slower growing, more pendant, and mechanically stronger fruit wood. Their belief is that although the trees do not size up nearly so rapidly as trees allowed to grow naturally, they are by this means obtaining trees which will last much longer and be better able to stand up under the weight of the fruit. The mere item of avoiding propping with many growers is sufficient to cause them to look with favor upon a system of pruning which develops a strong compact tree.

For the development of healthy fruit wood a certain amount of light is necessary. If left to grow naturally, even though all sucker wood be excluded, the Valencia will grow so compact and dense that the growth of fruit wood inside the tree is prevented. This results in by far the greater part of the fruit being borne on the outer branches where it is exposed to bright sunlight, wind, and various other agencies which may be more or less unfavorable. Outside fruit is usually of poorer quality than inside fruit, being rougher and coarser. In addition it is desirable to utilize the bearing area of the tree to its greatest capacity and this can only be done by growing inside fruit. Large amounts of inside fruit can be obtained by keeping the tree sufficiently open to permit enough sunlight to filter in to encourage the development of vigorous fruiting wood.

The writer is inclined to believe that such a system of pruning constitutes the most rational system for the handling of the Valencia in the light of our present knowledge. It takes into consideration the development of a strong framework, the building of the tree on slow growing fruit wood, and the encouraging of the production of inside fruit. Moreover, it at least seems calculated to produce trees which, other things being equal, should bear profitably over a longer period than many of our present old Valencia trees.

PURPLE VETCH

Purple vetch gives promise of being a valuable addition to the list of crops that can be grown in the South and Pacific Coast states where winters are not severe, according to Farmers' Bulletin 967, just published by the United States department of agriculture. This vetch, which is similar to the common and hairy varieties, but is less hardy, was brought into the United States by the office of foreign seed and plant introduction in 1899 from Italy. In California, where experimental work has been conducted, it has proved one of the best, if not the best, crop for use as green manure in orchards, and in commercial plantings it has been thought well of by the farmers who have used it. In Western Oregon and Western Washington it can be grown successfully as a seed crop, the yields averaging from 12 to 15 bushels an acre. It has not been sufficiently tested in the Southern states to determine definitely its value in localities where common vetch is now being grown, but as it requires conditions similar to the common varieties, according to the bulletin, it seems probable that it may serve an excellent purpose in this region as well as in the western United States. It is of high feeding value and makes good hay in pasturage.

Under average conditions purple vetch will stand a winter temperature of 15 degrees above zero with little or no injury. Where the temperatures are not likely to fall below this mark it would be sown in the fall. With colder winter conditions, spring seeding is essential. In localities where common vetch has been grown successfully and the necessary bacteria are established in the soil, it is not necessary to inoculate for purple vetch.

RESERVOIRS FOR OLIVE OIL

A regular system of reservoirs and pipe lines for distributing olive oil is to be established at Stavanger, Norway. These pipe lines will supply oil to this and other cities for use in fish packing establishments. A heating plant will keep the oil at proper temperature. The reservoirs will be porcelain lined and filtration apparatus will be installed.

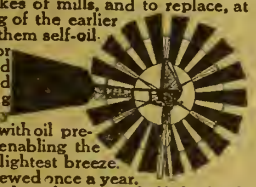
Los Angeles

THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

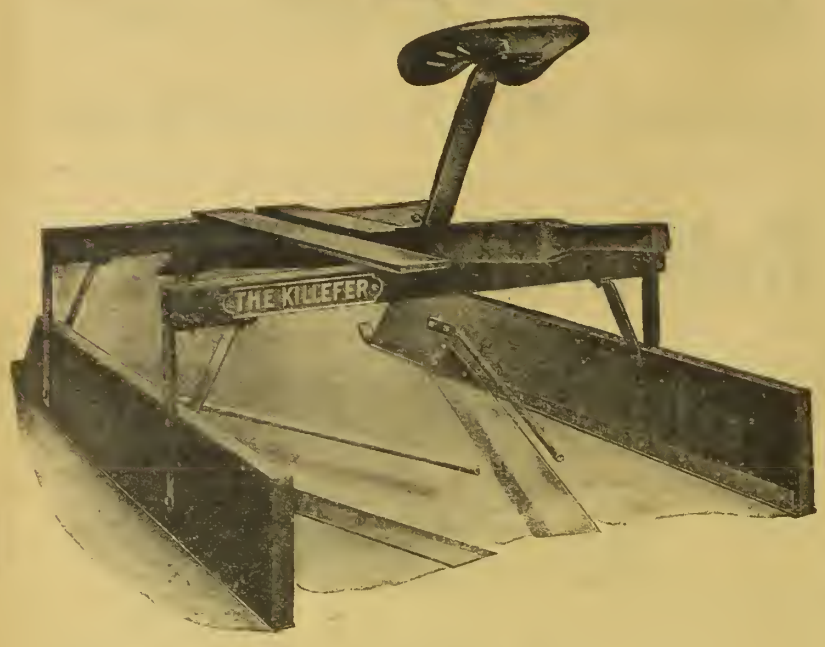
Bean Cutter

Killefer Quality — Killefer Efficiency

See Catalog No. 281



There will be a big demand for Bean Cutters this year and when the time comes they will be needed quickly. Do not delay putting in your order for what you need right away.

We build two weights of sled cutter, the one shown above being our regular wood frame cutter. For heavy ground, where a strong cutter is required, we make a steel arch frame at an additional cost of five dollars. Give your order to your dealer and insist upon having the Killefer kind.

Bean Cutter Blades

You will need extra blades and we can furnish 5-16 x 6 inch x 6 foot blades at $12.00 per pair f. o. b. Los Angeles.

DEALERS WRITE FOR DISCOUNT.

We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

The Lambert and Trundaar Tractors

No doubt you are wondering why you have not seen these tractors advertised. It is for the simple reason, the demand was so great for these powerful little machines we could not begin to supply them.

We have been gradually catching up and we are now in a position to take orders for a few more machines. If you contemplate buying a machine for any purpose INVESTIGATE. You cannot afford to buy any other.

Wm. Gregory and Sons
602 North Main Street
Los Angeles, California

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Name of Apple

Please give me name of apple ripening in late July, beautiful red, white flesh of high quality.—Subscriber, Redondo.

This apple was submitted to several and finally sent to Deputy State Horticultural Commissioner Weldon who has made large study of apples in California, and he answers: "I am not quite certain of this fruit. It resembles McIntosh Red quite closely but it is too early for this variety. Another variety closely related to the McIntosh and which it also resembles is the Fameuse or Snow. Both of these varieties are characterized by very white flesh sometimes streaked with red, as in the case of the specimen sent, and each possesses a very fine flavor. While the single specimen could not be identified as either one of these varieties it is possible that when the tree comes into heavier bearing it will be found that it is either McIntosh Red or Snow. Often young trees bear fruit that is not altogether characteristic of the variety and one may easily be led astray by abnormalities which occur during the first or second year's bearing. Therefore I would suggest that, until another season's crop comes at least, the variety be called either McIntosh or Snow, with a big question mark after the name. Next season if I might receive half a dozen specimens I believe that I could identify it for certain."

Sow Eating Chickens

Take a common hog nose ring and put another ring, say one inch in diameter, in the hog ring. Put ring in sow's nose just as you would to keep her from rooting. The small ring thus hangs loose over her nose. It does not interfere with her eating but she will not catch any more chickens.—A. M. Mitchell, Redlands.

Pipe Taints Water

In laying a pipe line I have inadvertently used some second hand gas pipe which spoils the water. Is there anything I can use to overcome the gas taste?—Subscriber, Artesia.

We know of no better way than to continue use until the foul taste is removed which might require a long time, or else one might take up the pipe and dip. However, where water is to be used for drinking purposes it is best to use only galvanized pipe.

Aphis

Inclosed is a pod of Blackeye bean. Would like to know what to do to exterminate bugs. I am sulphuring the vines to see what good that will do. What is the name of the bug?—Subscriber, Etiwanda.

This is aphis. Sulphur is of little or no value with this particular pest. Tobacco extract spray or a weak kerosene emulsion will fix these best but one spraying is usually not sufficient. If the infested plants are in the garden near a hydrant where the water is under considerable pressure, simply spraying with the water will knock them off.

Brown Fruit Scale

I irrigated my old apricot trees the last time June 20, and while they are ripening the fruit shrinks or dries up. What is the reason? Some trees have a scale on like a red bug. How shall I kill it?—Subscriber, National City.

When fruit shrivels up on the tree it is a sign that it is not getting sufficient moisture. The moisture is either not in the ground or there is something wrong with the root system, for the moisture must come through the roots. Very often the soil appears moist enough but when you dig down where the most of the roots are it is bone dry after a series of two or three dry years. There are many orchards on which the leaves and fruit have shriveled up and dropped.

The scale you describe is evidently brown apricot scale and infests prune trees as well. It sometimes almost encases the small branches. They usually disappear the second year so that it is very seldom that it is necessary to spray for them. There is a parasitc that takes care of them.—J. W. M.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal querles in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Quit Claim Deed

How can I go about getting a quit-claim deed of my property to my wife, and my wife to me?—Subscriber, Huntington Park.

You can get two quit-claim deeds at any stationery store, take them to a notary public, fill out the blanks on the deeds, sign them and acknowledge them and then each deliver the respective deeds to the other. That is a rather dangerous method of doing and has frequently been the cause of litigation of one nature or another. The best and the safest method for the usual case, and which usually attains the desired end, is to file a declaration of homestead upon the property, then in case of the death of either the property descends to the other without administration.

Will Legal in California

Must a will to be legal in California be drawn in the state of California?—Subscriber, Garden Grove.

No. It is sufficient if the will wherever drawn conforms as to its form and execution to the laws of California. That is likewise the general law throughout the United States.

Disposal of Estate

A man dies leaving a will which reads in part, "To my wife, the home at a certain number and street, value $4000 and all therein," also a stated amount of money, the balance of the money left to be divided equally among the children, naming each. Can the value of the home be changed by the appraisers and the balance taken from the estate? Can the appraisers place a value upon the furniture therein when nothing as to that value has been said? The property has not lost in value. What is the monthly allowance to the wife alone by law from an estate under $20,000? What is the administrator's fee upon such an estate?—Subscriber.

The appraisers are required to place a valuation upon each item of the estate; this is for the purpose of fixing the inheritance taxes, administrator's fees, etc. From the facts stated, it would seem that the valuation was merely part of the description of the house and, as such it would not entitle the widow to make up any supposed deficiency from the specific legacies to the children. The valuation of the appraisers is not for the purpose of affecting the disposition by the will of specific legacies wherein it appears that the valuation was

used merely as a part of the description. The law does not fix any monthly allowance for the wife in any size of estate; within the discretion of the court, upon petition, the widow may receive such monthly allowance from the estate as may be deemed reasonable by the court. She may also be allowed the possession of the homestead and furniture thereof for such time as the court may deem reasonable. The administrator's fee is seven per cent upon the first $1000; for the next $9000 at the rate of four per cent; for the next $10,000 at the rate of three per cent.

Army worms have been reported as doing considerable damage in various sections of the state. State Horticultural Commissioner Hecke is collecting information as to the extent of the invasion and methods of control used.

GROZ-IT

Highly Concentrated Pulverized

Manure

A mixture of cattle and sheep manure from animals fed on cotton seed meal and cake and alfalfa (highly nitrogenous foods) aged for several years under climate conditions that remove moisture but prevent leaching and fermenting.

No odor.

No flies or insects.

No weed seed or foreign matter.

Many times plant food values of ordinary manure.

Guaranteed contents.

Nitrogen, 1.5 to 2.0 per cent.

Phos. Acid, P_2O_5, 1.25 to 2 per cent.

Potash K_2O water soluble, 4 to 5 per cent.

We are shipping GROZ-IT in immense quantities to Southern and Eastern states, where present freight rates make it $10 per ton more than cost to you. Place your order now to insure delivery.

Sold in bags or bulk.

Write for circular and prices.

IMPERIAL-LAGUNA IRRIGATION PLAN

The negotiations to connect the irrigation systems of Imperial Valley in Southern California with the Laguna Dam built by the reclamation service on the Colorado River at Yuma, Arizona, have been under way for months, and in June the Imperial Irrigation District sent the interior department a draft of proposed contract by which Imperial Valley could connect with the government dam, thus acquiring a permanent, stable diversion and clearer water from the desilting works at Laguna. The district requested a number of changes in the proposed agreement, and today the department sent a new draft accepting most of the the district changes. The remaining points relate to water for the government irrigation project at Yuma and the development of power. On these points the contract reads as follows:

"The Secretary of the Interior shall control the division of water and shall divert for use of the Yuma project or any auxiliary thereof as heretofore or hereafter undertaken by the United States within the present boundaries of the United States and not exceeding 120,000 acres, sufficient water to secure the permanent and economical reclamation thereof, not exceeding, however, one-quarter of the water in the river above Laguna Dam.

"The United States reserves the right to develop power with the water in the enlarged main canal down to and including Siphon Drop. All other power possibilities in the main canal down to and including some convenient power site near Pilot Knob shall be developed by the United States to the extent deemed expedient by the secretary of the interior, at the joint expense and for the joint benefit of the Yuma project and the Imperial irrigation district as herein provided. The apportionment of the cost of canal and headworks alterations and enlargements, and of canal extension from the Laguna Dam to the site selected for power development near Pilot Knob, shall be made to the United States (for the Yuma project) and to the Imperial Irrigation District, in the proportion that 2000 second-feet bears to the total canal enlargement less 2000 second-feet. The cost of constructing power plants, transmission lines and other power plant accessories shall be also apportioned to Yuma project and the district, respectively, in the ratio that 8500 water horse power bears to the aggregate water horse power capacity of the plant installed."

This is followed by a provision for operation and maintenance of the power works by the interior department, delivering power to Yuma project and Imperial Valley for irrigation at cost plus ten per cent, the profits on this and commercial power sales being divided between the two in the ratio of their investments in the power plants and related works. The Yuma project is given a preference right to purchase power for irrigation pumping for a project of not exceeding 120,000 acres.

Further information may be secured from Director Reclamation Service, Washington, D. C.

TAKE CARE OF TREADS

It is surprising how many motorists never bother about the condition of the tread of their tires. The tread of rubber covering protects the cotton carcass of the tire from injury. Obviously, then, it is important that the tread be kept intact. Otherwise dirt, grease, water and other injurious substances gain access to the fabric and rapid deterioration results.

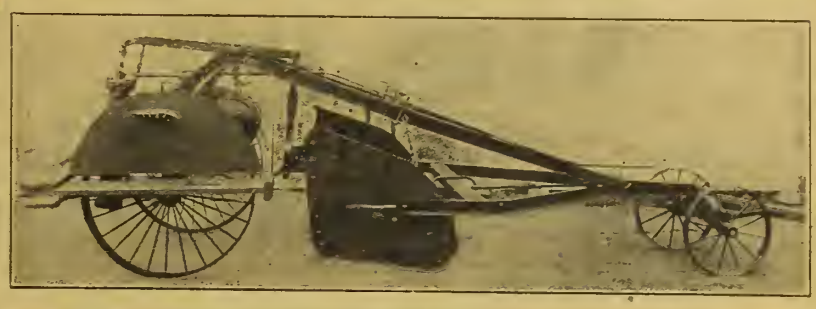
Small slashes and holes should be immediately plugged with plastic. If minor cuts that are caused by running over glass, sharp pebbles, etc., are not taken care of, the tire will surely go out of service prematurely. As the tire rolls along the cut sucks in water and gravel, which are absorbed by the fabric, just as a wick absorbs oil. The moisture causes separation of the tread from the fabric and the dirt works in at the point of separation. Soon the accumulation of dirt causes a "sand blister" or "mud boil." The tread continues to loosen farther around the tire and the fabric slowly rots away.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM



Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

Send today for full information and our latest catalog of earth-moving machines.

The Bee Moth

Written for California Cultivator By Geo. A. Coleman

THE presence of the bee moth or "wax-worm" in the hive is evidence that all is not well otherwise with the bees.

Black bees do not protect their combs from the moth as well as good Italian bees. They are also more susceptible to brood diseases and so the colony may become too weak to protect themselves. Therefore, as a preventive measure keep only pure Italian stock.

Box hives or movable frame hives which have poor fitting covers, knot holes, season cracks, rough edges, etc., readily admit the adult moth as they can get through a very small crack and they can then lay their eggs in the comb. To prevent use only first class dovetail, metal roofed telescope covers and good tongue and groove bottom boards.

Keep all empty combs in tight boxes and fumigate once or twice during summer or season when not in use with carbon bisulphide or fumes of sulphur.

Examine all hives and frames occasionally for the larvae or "wax-worms" which can be destroyed in the comb with a wire or toothpick.

If you find combs all eaten up and the cocoons full of moth larvae the best thing is to burn them up.

Do not take all the honey away from the bees. Leave enough to carry them through the season when nothing is coming in.

Do not try to make nuclei unless the bees are bringing in plenty of nectar and pollen and in settled warm weather.

Do not leave hives or honey open so that robbing is started.

Every Type of Tractor

Manager O'Neal of the third annual tractor demonstration to be held at Los Angeles, September 17-21, is anticipating attendance which will prove a record breaker. Tractors and improved labor saving implements are imperative and the farmer is anxious for the information which will enable him to make intelligent selection. This opportunity is offered in this great demonstration.

One of the officials of the Traction Engine & Implement Dealers' Association of Southern California declared: "The educational value of being able to see the various makes and types of tractors operate side by side for comparison and the unsual opportunity to inspect thousands of dollars' worth of the finest implements, farm appliances and articles essential to the food grower, is worth hundreds of dollars to every man who farms, and his family."

A special program of events will take place every day. Rest rooms, dining room and other accommodations will be provided as well as ample parking space for automobiles.

One of the interesting exhibits will be that of the National Automotive School. Its students will work on various makes of tractors right on the grounds, demonstrating the proper methods of repairing; and a valuable free course of lectures will be given by different members of its faculty. Two lectures will be given daily and these will be of particular interest to tractor owners and prospective buyers as the instructors will give practical and concise advice on the care and upkeep of all makes of machines.

DRY STOVER FOR SILAGE

By mixing water with dry stover excellent ensilage can be made. Tests which demonstrated its value have recently been carried through by the Illinois agricultural college. Special machines have been built which husk the corn, mix the dry stover with water and make it into ensilage. In this way the food value of the dry stover, often wasted, is made fully available.

"The American people will gladly make any sacrifice in consumption and in the production of foodstuffs that will maintain the health, comfort and the courage of the people of the Allied countries. We are in fact eating at the common table with them." —President Wilson.

Those who dare all must share all.

Santa Anita Rancho

Anoakia Breeding Farm

Registered Holsteins

A herd of fine individuals, strongly bred in the lines of great production as evidenced by both short and long time records, handled in a manner to produce sound, healthy breeding stock.

Merci Lad Korndyke Burke

our senior herd sire, is by De Kol Hengerveld Burke and out of Winnie Korndyke Cornucopia De Kol, 31,034.1 pounds milk and 1201.00 pounds butter in one year, the first cow in California to produce 1200 pounds butter in one year. A few of his young sons out of good record dams for sale.

Prince Walker Cornucopia

Our junior herd sire, is sired by PRINCE GELSCHE WALKER, and out of Alba Sadie Cornucopia Creetia, 34.14 pounds butter in seven days, who is by a son of the first 30-pound cow, Sadie Vale Concordia who is dam of Sadie Vale Concordia 4th, 41.06 pounds butter in seven days, who in turn is the dam of the great sire, King Korndyke Sadie Vale and Sadie Vale Concordia 4th's Pietje, 38.43 pounds butter in seven days.

We expect to have at least 100 cows and heifers bred to Prince Walker Cornucopia by the time he is two years old, thus giving him one of the greatest opportunities yet afforded a young sire in the west.

We have a few good sons of Prince Gelsche Walker to offer at present.

California Educational Butter and Cheese Scoring Contest at Tulare

By S. L. Denning

THE second scoring of the California Educational Butter and Cheese Scoring Contest was a success from the standpoint of attendance and interest. The butter makers have appreciated the value which is to be derived from their attendance at these gatherings and a representative number were present. This year's scorings have been held in different parts of the state in order to give as many butter makers as possible the opportunity of attending at least one of the scorings during the year. The meeting was well attended and some very interesting discussions took place. Besides those on the regular program F. W. Andreason of the state dairy bureau was present and made a short talk.

Sixteen cubes of butter and three cheese were entered for scoring. L. M. Davis of the bureau of markets and Dr. C. L. Roadhouse and S. L. Denning of the dairy division of the University Farm were the judges.

The scores on the entries which scored 91 or above are as follows:

The most serious defect was the presence of an old cream flavor. At this time of the year it is a serious problem with some creameries to obtain their cream in a first class condition. It should be remembered that the sooner gathered cream is churned the better the resulting butter will be. Some plants find it advisable to churn at night, so as to get each day's cream into butter as soon as possible. This plan might be followed by other creameries with good results.

There was again a big variation in the moisture and salt percentages in the different cubes. The percentage of salt varied from 1.65 per cent up to 4.1 per cent. The moisture content of several cubes was below 14.5 per cent. No doubt many buttermakers control their composition very closely from day to day but others can well afford to pay more attention to their test in the control of these factors. Besides being unable to make a uniform butter with a large variation in moisture and salt the overrun is largely dependent upon them and suffers if they are too low.

Butter

Name	Commercial Score	Composition Score	Average Score
N. Nyborg, Northern Cal. Milk Producers' Asso., Modesto	93½	100	96¾
W. F. Butler, Visalia Cooperative, Visalia	93¾	100	96⅜
E. M. Cook, Kerman, Kerman	92½	100	96¼
C. O. Johnson, Bodega, Bodega	92	99½	95¾
G. G. Plunkett, Exeter, Exeter	92½	98½	95½
H. P. Pyke, Orland Cheese and Butter Company, Orland	91½	99	95¼
H. Dons, University Farm Creamery, Davis	93¼	96½	94⅞
T. C. Moran, Oakdale, Oakdale	93	94	93½
N. Hansen, Western Refrigeration Company, Petaluma	91¼	95	93⅛
C. V. Haslin, Sierra, Madera	92½	93	93¾
A. Wirz, Hollister, Hollister	91¼	91½	91⅜
Cheddar Cheese			
O. R. Lynch, University Farm Creamery, Davis	93½		
H. C. Watson, Watson Cheese Factory, McArthur	91		

Butter Shows Good Workmanship

The workmanship on the entries in this scoring was very good. The absence of leaky body was very noticeable. Most of the entries had a close, dry firm body, although a few samples were criticised for being sticky and overworked. The average commercial score of the 16 samples was 91.84. The color of the entries was very uniform and even. Three cubes were criticised for being light in color but none for being mottled.

Few Cheese Entered

The small number of cheese entered was due largely to the high price of milk and the comparatively low price of cheese which has necessitated the closing of several factories. The cheese which were entered, however, were of very good quality.

The third and last scoring will be held at Davis on November 21 in connection with the experienced buttermakers' short course. There will also be a butter and cheese scoring at the state fair.

There were 2028 Junior two year olds tested in the United States during the fiscal year 1917.

We stood as follows:
7 day Butter Records, 10th, 14th, 31st.
30 day Butter Records, 4th, 9th, 12th, 18th, 29th.
7 day Milk Records, 5th. 30 day Milk Records, 3rd, 6th, 17th.

In the Senior Two Class we stood:
7 day Butter Record, 20th. 7 day Milk Record, 11th.
30 day Butter Record, 7th. 30 day Milk Record, 6th.

Junior Three Class: 7 day Butter, 12th; 7 day Milk, 4th.
Senior Four Class: 7 day Butter, 15th; 7 day Milk, 7th.

Aged Class:
7 day Butter, 9th, 38th, 41st. 7 day Milk, 25th, 26th, 29th.
30 day Butter, 13th. 30 day Milk, 14th.

King Segis Alcartra Prilly is being bred to the above enumerated cows, also about fifty more just as good.

Young Bulls from High Record Dams for sale.

Bridgford Company, Knightsen, Contra Costa Co., Cal.

King Sadie Vale Idyl Segis

Heads Sunnyside Herd

His Dam is the California State Record junior 4 year old for 7 and 30 days

His Sire is a son of the only 40 lb. bull that has a 40 lb. daughter

Sire: KING KORNDYKE SADIE VALE 27th, son of King Korndyke Sadie Vale and a 27.98 pound daughter of a 32 pound cow. One of his five months old daughters sold for $1400.00 at Sacramento last December.

Dam: K. P. IDYL SEGIS, at four years, three months, butter seven days 35.57, milk 510.8, butter 30 days 132.13, milk 2488.6, best day's milk 95.8. As a three year old she made over 31 pounds butter in seven days. She is a daughter of King of the Pontiacs, the only double century sire.

KING SADIE VALE IDYL SEGIS was selected especially as a fit mate for the 30 daughters of Sir Veeman Korndyke Pontiac, 30 pound son of Sir Veeman Hengerveld, that are in my herd.

I now have for sale a few dandy sons of Sir Veeman Korndyke Pontiac out of some of the best cows sold in my spring sale. Some of them are about ready for service and are priced to interest dairymen.

Prince Hiske Walker

HEADS MY HERD

You Need One of His Sons

You Need One of His Sons

Sire: PRINCE GELSCHE WALKER 81663, whose daughters have broken more state and world's records than the daughters of any other sire in California.

Dam: HISKE OF RIVERSIDE 93936, 26.68 pounds butter in seven days, 711.57 pounds butter in one year.

Full brother to LADY HISKE WALKER, 34.25 pounds butter in seven days, second highest California record for a junior four year old.

Seventy-five per cent the same blood as MISS VALLEY MEAD DE KOL WALKER, 36.81 pounds butter in seven days, 1114.66 pounds butter in one year as a junior three year old, (second highest in class) 25.25 pounds butter in seven days eight months after calving at three years, (world's record for age.)

PRINCE HISKE WALKER has been mated with a large number of well bred cows in my herd, including 20 A. R. O. cows with good records. His calves are vigorous, well marked and good individuals. I offer a very few of his young sons at this time.

First Tulare Sale

Registered Holsteins

The fine new sales pavilion now being provided by Tulare Livestock Association will be dedicated by a sale of registered Holsteins at

Tulare, California

Thursday, Nov. 21, 1918

A very desirable lot of breeding cattle will be found in this sale, many of the females bred to the great young sires now owned in Tulare County.

MANAGEMENT

California Breeders Sales and Pedigree Company

J. M. Henderson, Jr., President C. L. Hughes, Sales Manager

Sacramento, California.

Tulare Coun

FEW California communities have as yet taken advantage of the benefits that surely follow when a given locality acquires a wide reputation as the home of select registered live stock. In fact there is probably no single community that has achieved success in this respect, with the one exception of Kings County, made famous by its breeders as a center where the highest class Poland-China swine may always be found.

Tulare County has now been put on the livestock map in a large way by the breeders within its borders who have established herds of outstanding excellence, and so rapidly has this development taken place that probably only a comparatively few residents of the county itself realize just what has taken place and what it means to the future of the community.

There are many herds of registered hogs in the county, but not until recently have the breeders made any special effort to exploit the community idea. The recent organization of the Duroc-Jersey men promises to make the county one of the leading centers of the breed on the Pacific Coast.

Tulare County also has one of the finest herds of registered Jerseys in California, owned by A. A. Jenkins. The practice in this herd of giving every female of milking age a Register of Merit record, and then the offering of only really select bulls for sale for breeding purposes, are large factors in bringing about the excellent demand for breeding bulls that the Jenkins herd enjoys.

The most spectacular and far reaching livestock development in Tulare County, however, has been in the herds of registered Holsteins, and whether or not the breeders originally started out with any definite community plan in view, the fact remains that the cattle they secured and the blood lines to which they have shown general preference are of such outstanding quality that the outside buyer going to Tulare County can go to at least a dozen Holstein herds and find a high degree of uniformity in breeding and type.

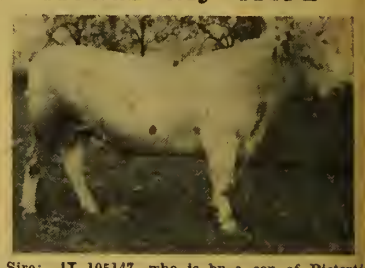
The writer recently had occasion to make up some totals on Tulare County live stock and found among the items that 11 registered Holstein bulls have been purchased by breeders within the county during the past two years for a total of approximately $22,000 or an average of $2000, and the main thing is that these bulls were all purchased well within their value. Since this total was compiled R. F. Guerin has purchased a great young sire whose purchase price will materially increase the average given for 11 bulls.

The Holstein breeders of Tulare County are all practical men, and all would no doubt be rated as men of modest means, but none of them have hesitated to pay for quality, and it is that same quality that is going to give Tulare County a prominent place in the minds of prospective Holstein buyers in the future.

The big thing in Tulare County is the dairy business and its allied industries, swine and poultry raising, and any plan of action that will increase the production of every dairy cow in the county will have an immediate effect upon every form of business in the county. The establishment of these splendid Holstein herds, headed by bulls of such outstanding merit, will contribute to such a result in a very large way. Dairymen of the county will be able to secure from these breeders bulls of the very best breeding, breeding that has produced and is now producing world's

It State Bells

Heads My Herd



Sire: IT 105147, who is by a son of Pietertje Maid Ormsby, 35.56 pounds butter in seven days, 145.66 pounds in 30 days, and is out of Pontiac Clothilde De Kol 2nd, the first cow to make 37 pounds butter in seven days and over 1200 pounds in one year.

Dam: K. P. STATE BELLS 217066, 27.88 pounds butter in seven days, 108.50 pounds butter in 30 days as a junior four year old. She is by King of the Pontiacs and out of a daughter of Do Kol 2nd's Butter Boy 3d.

Young sons of IT STATE BELLS out of well bred dams for sale.

E. C. Wharton, **Tulare, Cal.**

King Mead of Riverside 7th

Heads My Herd

Sire: KING MEAD OF RIVERSIDE 50290, sire of the world's official record cow Aaggie Acme of Riverside 2nd, 1331.41 pounds butter in one year. He is the only bull in the world all of whose daughters tested for one year average over four per cent butter fat.

Dam: CHANGELING TIDY ABBEKERK LOIS 166082, 613.1 pounds milk and 26.76 pounds butter in seven days, she by Changeling Butter Boy and out of a 30.54 pounds daughter of Tidy Abbekerk Prince. She is 100 per cent the same blood as Changeling Tidy Abbekerk Wayne, 44.43 pounds butter in seven days.

KING MEAD OF RIVERSIDE 7TH. Is acknowledged to be a wonderful individual as well as one of the best bred bulls in service in the state.

Dairymen, let me price young bulls to you.

L. W. Bardsley

TULARE, CAL.

King Ignaro Mead

Heads My Herd

Sire: KING MEAD OF RIVERSIDE 50290, the only sire whose entire list of yearly record daughters average over four per cent butter fat, among them the world's official record cow Aaggie Acme of Riverside 2nd, 1331.41 pounds butter in one year.

Dam: IGNARO CREAMCUP 102569, who made 29,545.0 pounds milk and 1077.76 pounds butter in one year. She is by Ignaro De Kol, the only bull with nine daughters above 20,000 pounds milk in one year, and the only bull that has 14 yearly record daughters, his entire list, that average over 20,000 pounds milk in one year.

Young bulls for sale.

Charles Yocum, **Tulare, Cal.**

y—Livestock Headquarters

records in milk and butter production, and wherever one of these bulls finds his way to the head of a herd of grade cows there will be a great improvement even in the first crop of calves, and as these good bulls are used on succeeding generations, gradually breeding out the common blood, Tulare County dairymen are going to have a class of grade Holstein cows that will stand out both for type and production, and they too will receive attention from buyers who want the best grade cows.

The business men of the county are beginning to realize something of what the future holds on account of the progressive work of the live stock breeders and show a willingness to cooperate in making town energy and country energy work in double harness. A concrete example of this spirit is shown by the recent organization of what will be known as Tulare Livestock Association, an organization composed of breeders, farmers, and town business men. A plot of ground 300 feet square, just in the edge of the city of Tulare and on the state highway, has been purchased, and upon it will be erected an $8000 sales pavilion where high class, well conducted sales of live stock may be held from time to time. The new building will be dedicated by a sale of registered Holsteins on November 21. and sales of other kinds of stock will no doubt follow.

King Korndyke Pontiac 20th, the great $6500 son of Miss Valley Mead De Kol Walker and King Korndyke Pontiac, will be seen on the show circuit this year. His owner, W. J. Higdon, Tulare, will show about a dozen head. There is a senior bull calf in this herd that—well just cast your eye over him at the state fair.

Prince Hiske Walker, owned by Walter Mitchell, Visalia, has not only developed into a very pleasing individual but is siring a great lot of calves. Mr. Mitchell has enough of his daughters to make a small herd, and it will also be remembered that H. E. Cornwell, Modesto, has about 15 daughters of this young sire. Prince Hiske Walker is being given heavy service in Mr. Mitchell's herd right now and within the next year he should have one of the largest groups of daughters of any bull in the state.

Alex Whaley, Tulare, made a ten strike when he bought Sir Aaggie De Kol Acme 2nd to head his herd of select heifers and cows. This young sire has the distinction of having the second highest average yearly butter record for five of his seven nearest dams, of any bull yet in service. Mr. Whaley bought him just in time as one of the most prominent Eastern breeders wanted him. This same breeder afterward paid a five figure price for a young bull with smaller average records behind him.

E. G. Wharton, Tulare, has a well bred herd of registered Holstein females headed by the splendidly bred bull It State Bells, who is by It and out of a 27 pound four year old daughter of King of the Pontiacs.

L. W. Bardsley, Tulare, is gradually replacing his grade Holsteins with purebreds and already has quite a number of choice breeding cows. At the fourth Sacramento sale he secured the fine young bull King Mead of Riverside 7th to head his herd. This young fellow is a beautiful individual and is bred in the purple, being by King Mead of Riverside and out of a 26 pound daughter of Changeling Butter Boy, and dam a 30 pound daughter of Tidy Abbekerk Prince.

Charles Yocum, Tulare, has gathered a small but select herd of registered Holsteins headed by King Ignaro Mead, who is by King Mead of Riverside and out of a daughter of Ignaro De Kol that made over 29,000 pounds milk and 1077 pounds butter in one year. He is developing into a first class individual.

R. F. Guerin, Visalia, has a fine herd of registered Holstein heifers growing up. About 30 of them are daughters of Sir Veeman Korndyke Pontiac, the 30 pound son of Sir Veeman Hengerveld, formerly at the head of Mr. Guerin's herd. These heifers are out of good record dams and will now be bred to King Sadie Vale Idyl Segis, the richly bred young bull Mr. Guerin recently purchased from McAlister & Son. This young sire is by King Korndyke Sadie Vale 27th and out of K. P. Idyl Segis, the California state record 4 year old for 7 and 30 days. She recently made 35.57 pounds butter in 7 days, 132.13 pounds in 30 days, and is a daughter of the only double century sire, King of the Pontiacs.

R. C. Sturgeon, Tulare, went out after the tops in foundation cattle for his herd of registered Holsteins and has gathered a notable herd in a short time. To head the good females he purchased the highly bred young bull Segis Pontiac Abbekerk, who is by Segis Pontiac De Kol Burke and out of Changeling Tidy Abbekerk Gem. the only 35 pound cow in the west that made over 34 pounds butter in seven days at the previous freshening. She is by Changeling Butter Boy, who now has over 100 A. R. O. daughters and is out of a 31 pound daughter of Tidy Abbekerk Prince.

Segis Pontiac Abbekerk
HEADS MY HERD

Sire: SEGIS PONTIAC DE KOL BURKE 97472, son of the former world's record cow Riverside Sadie De Kol Burke. He has 15 A. R. O. daughters including Aralia De Kol Pontiac Mead, 932.44 pounds butter in one year as a senior two year old, California record in class, and 34.44 pounds butter in seven days, 138.43 pounds in 30 days as a senior three year old, both California records in class.

Dam: CHANGELING TIDY ABBEKERK GEM, 639.0 pounds milk and 35.07 pounds butter in seven days. As a four year old she made 19,389.9 pounds milk and 767.36 pounds butter in one year. She is the only cow in California that has made over 34 and 35 pounds butter in seven days in two successive lactation periods. She is by Changeling Butter Boy and out of a 31.70 pound daughter of Tidy Abbekerk Prince.

HIS THREE NEAREST DAMS AVERAGE
Milk seven days..... 716.23
Butter 33.02
Milk 30 days 2938.23
Butter 130.91

For the present he is being mated with our foundation herd of about 40 high class cows and heifers. Keep this bull in mind, for he is going to be heard from later.

R. C. STURGEON
TULARE, CAL.

Sir Aaggie De Kol Acme 2nd
HEADS MY HERD

The average yearly butter records of five of his seven nearest dams is equalled by only one service bull in the world.

Four of his seven nearest dams made world's records.
Three of his seven nearest sires have 14 daughters above 20,000 pounds milk and seven above 1000 pounds butter.

Sire: SIR AAGGIE DE KOL ACME 185724, son of the world's official record cow Aaggie Acme of Riverside 2nd, 1331.41 pounds butter in one year.

Dam: ARALIA DE KOL 3D 164130, daughter of the former world's record cow Aralia De Kol. At two years, three months she made 17,509.5 pounds milk and 772.93 pounds butter in one year. At six years she made 646.2 pounds milk and 28.75 pounds butter in seven days, 24,554.1 pounds milk and 1100.47 pounds butter in one year.

FIVE OF HIS SEVEN NEAREST DAMS AVERAGE
Milk one year.....24,089.88 pounds
Butter ..... 1,105.07 pounds

This butter average is equaled by only one other bull of service age in the world.

SIR AAGGIE DE KOL ACME 2ND is being bred to a choice lot of cows and heifers in my herd. Keep your eye on him for through one of his young sons you can secure yearly record blood that is unsurpassed.

Eldorado Holstein Herd
Alex. Whaley, Owner *Tulare, Cal.*

We Like This Combination

Prince Riverside Walker

Sire: PRINCE GELSCHE WALKER 81663, whose daughters hold many state records and have broken world's records. His daughters are great dairy cows, notable for unusual capacity, veining, and splendid udders.

Dam: AAGGIE ACME OF RIVERSIDE 93957, 28.35 pounds butter in seven days, 808.82 pounds butter in one year. She is the dam of Aaggie Acme of Riverside 2nd, 35.38 pounds butter in seven days, 142.23 pounds butter in 30 days, 1331.41 pounds butter in one year, the world's record for a strictly official yearly test.

PRINCE RIVERSIDE WALKER is siring a beautiful lot of calves, and none of his sons have remained in our herd long enough to reach service age. We have a few good ones that will be ready for service soon.

King Korndyke Pontiac 20th

Sire: KING KORNDYKE PONTIAC 188174, who is by King of the Pontiacs and out of a half sister of Prince Gelsche Walker. He is conceded to be one of the greatest individual sons of his great sire, and is in heavy service in the fine herd at Jane Garden Farms, owned by Fred W. Kiesel, Sacramento.

Dam: MISS VALLEY MEAD DE KOL WALKER 250936, 688.6 pounds milk and 36.81 pounds butter in seven days, 21975.8 pounds milk and 1114.66 pounds butter in 339 days, as a junior three year old. Her yearly butter record is second highest in the world in class. She also held the world's record in the eight month after calving division as a senior 2 year old, and holds the world's record in the junior three year old class of the same division at the present time. As a senior two year old she made 17,010.9 pounds milk and 790.38 pounds butter in 257 days. She won first place in California Dairy Cow Competition over all ages and breeds, and is unquestionably one of the greatest heifers of the breed considered from every standpoint.

We have none of his sons yet to offer, but we will still accept a limited number of approved cows to his service.

You are cordially invited to visit our farm and see our herd. We have aimed to secure the most productive blood coupled with a high degree of desirable type, and believe that we have succeeded.

Our Entire Herd Is Tuberculin Tested

We will exhibit at California State Fair. Look up our exhibit and see the sort of youngsters we are breeding.

CHINO, CALIFORNIA

IT IT

A SILO PAYS

Continued from Page 173

has been irrigated twice and will probably require two more irrigations as it has begun to show a few tassels and should grow 4 or 5 feet more.

We are at the present time feeding 30 pounds of ensilage and 25 pounds alfalfa hay per day to each of our 40 head of Holsteins. If we did not have the ensilage a cow would require at least 25 pounds more hay per day, which would amount to 15 tons per month for 40 head and at the present delivered price of $30 per ton for alfalfa, would amount to $450 per month. At $5 per ton (a liberal figure) the 18 tons of ensilage which we are feeding in place of the 15 tons of hay, would cost $90, which means that our silos are at the present time saving us $360 per month on our feed bill. That is the biggest argument we know of for silos. A saving of $360 per month in the feeding of 40 head of dairy cows at this time of the year and this year of the war makes a silo not only a financial necessity but a patriotic duty. Our advice to dairymen is to own a silo, and the best silo that can be bought, for like most other things the best is the cheapest in the long run, prepare the land well and sow the best seed, wait till the corn is mature before filling, then keep knives sharp and fill fast, using plenty of water by running a full stream into the blower. Have a small enough diameter silo for the size of your herd so as to feed off several inches in depth every day.

If we could not have a silo we would not be in the dairy business. See Mr. Copini's article on page 190.

Three Highest State Records

K. P. Tola, daughter of King of the Pontiacs, has seven day record of 34.03 pounds butter, and 30 day record of 2748.8 pounds milk and 139.90 pounds butter. Her one day milk record is 103 pounds. K. P. Tola and K. P. Idyl Segis are both the property of the McAlisters.

TWO GREAT RECORDS

Of the many excellent records of milk and butter production made in the fine herd of registered Holsteins owned by McAlister & Son, Chino, none have been more creditable than those recently made by two daughters of King of the Pontiacs.

The first of these was made by K. P. Tola, who by the way is full sister to the state record two year old K. P. Tola Joe. In seven days she made 34.03 pounds butter from 571.7 pounds milk, and in 30 days 139.90 pounds butter from 2748.8 pounds milk, milking as high as 103 pounds in one day. Her 30 day butter record is the third highest in California.

The other record was made by K. P. Idyl Segis, a junior four year old, who made 35.57 pounds butter from 510.8 pounds milk in seven days, 132.13 pounds butter from 2488.6 pounds milk in 30 days, milking as high as 95.8 pounds in one day. She thus becomes the California state record four year old for butter in both the seven day and 30 day divisions.

McAlister & Son recently sold the yearling son of K. P. Idyl Segis by King Korndyke Sadie Vale 27th to R. F. Guerin, Visalia, at the longest price ever paid for a California bred bull.

Field Notes From the Live Stock Men

Santa Cruz County's farm adviser, Henry Washburn, is urging more general attention to pure bred sheep or at least to the use of pure bred rams in the flocks already in that county. The adviser is making a survey of mountain lands. He is accompanied by a forage grass specialist and hopes to determine as to pasturage possibilities of the county.

Heavy rains on the ranges of Arizona, Nevada and Idaho during the past few weeks have greatly increased pasturage possibilities. More rain is needed in Oregon.

The conducting of public sales of fat steers and fat hogs is proving wonderfully satisfactory in many California stock raising counties. Not only are better prices secured to producers but a lessened expense is possible to the purchaser.

W. F. Sandercock writes as to the Berkshire colony near Sacramento. He has on his own ranch foundation stock from the Frank Brush champion herd and also refers to Frank B. Anderson, Fred Kiesel, and others who are not only installing pure breds but preparing for exhibit at the coming state fair.

Chicago reports good cattle steadily advancing, corn feds around 1200 and 1300 pounds commanding as high as $18.65.

Imperial Valley hog growers are selling young hundred pound feeders for 15 cents and making more money than by finishing off.

Chicago stock yards report immense increase in the proportion of old brood sows. Some figure this means great reduction in another year's output.

"Free Milk for France" is slogan of a committee organized in New York City. The committee hopes to send one ton of dry milk daily. One ton of dry milk is equal to 8400 quarts.

C. B. Cunningham, the very able and popular president of the State Swine Breeders' Association, is taking a well earned vacation at Santa Cruz. Mr. Cunningham, in addition to his regular busy days with his large fruit interests and oversight of his splendid "Biliken" herd of Chester White swine, has for months devoted a large proportion of his time to government war work for the live stock division of the state food commission. He is working days and dreaming nights for more and better hogs. His slogan is; "Fat will win the war and we can and will produce the fat."

Small packers and cattlemen are making an endeavor to secure a correction of marketing conditions of hides. It is asserted that under present arrangements large packing houses have an advantage of from $3.00 to $5.00 per head on every animal they slaughter because the tanner combine does not deal with all on the same basis.

Anoakia Diotime Korndyke, in the registered Holstein herd owned by H. E. Cornwell, Modesto, recently completed an official seven day record of 17.39 pounds butter at the age of two years and one month. She is sired by King Korndyke Pontiac, one of the sires at head of Jane Garden Farm herd owned by Fred W. Keisel, Sacramento. This heifer was given no special preparation and ran out with the herd during the seven days of her test. She is a very good individual and will probably be continued on semi-official test as Mr. Cornwell places much more weight on yearly records than on the short time ones.

The first calves by King Pontiac 20th, W. J. Higdon's $6500 son of Miss Valley Mead De Kol Walker and King Korndyke Pontiac, have arrived and they look most promising. The first one was a son, born in the A. W. Morris & Sons herd. King Korndyke Pontiac 20th himself is developing into a very pleasing individual. He will probably be seen on the show circuit this year.

Wm. Bernstein, Hanford, is getting his farm in shape to carry on the breeding of Poland-Chinas on a much larger scale than ever before, but will not show this year. This herd has made a splendid record right from the day it was founded and has been one of the factors in making Kings Coun-

F. D. Ross, Hanford, decided at the last moment not to show his Poland-Chinas and Holsteins this year. He has a yearling boar that would strengthen any show, and some Holstein heifers that look especially good to say nothing of a senior bull calf that would be a real contender.

Holsteins in England have been doing wonders during war time and public sale prices have been steadily mounting. The latest high record sale was composed of 54 animals that sold for an average of $1910. The top of the sale was the cow Eske Hetty who sold for $17,500. She holds the milk record for England over all breeds, with a production of 2413 gallons in 365 days. She, with several others, was purchased by one of the big breeders of milking Shorthorns.

A world's record was recently established at Holywood Farm, owned by F. S. Stimson, Hollywood, Washington. The force couldn't see any chance at the moment of breaking a world's record with one of the registered Holsteins so they turned their attention to war savings stamps. The 60 employes of the farm took $9000 worth and just to make it round numbers Mr. Stimson took $1000 worth making a total of $10,000 for Hollywood Farm. This is the world's W. S. S. record for a dairy farm.

Jane Garden Farm, owned by Fred W. Kiesel, Sacramento, is on one of the most delightful roads out of Sacramento. The paved highway following the east bank of the Sacramento River has been extended several miles past the farm and work is in progress further along. There is a steady procession of automobiles past the farm particularly on Sundays, and a lot of folks are getting a mighty good first impression of pure bred Holsteins as they view the Jane Garden Farm herd from the highway, which passes above the corrals.

Pennant Wayne Clothilde, a registered Holstein heifer owned by J. H. Harlan Company, Woodland, recently completed a yearly record begun at two years one month, making 13438.3 pounds milk and 619.10 pounds butter. She is sired by Star Youth Korndkye Wayne, the first herd sire used by Dr. E. J. Weldon, Sacramento, who is the breeder of this heifer.

George V. Beckman of Lodi has a carload (87) of very even Poland-Chinas ready for shipment. They were produced on pasture and barley and will average better than 200 pounds. Another carload of young stock of the same even quality will be ready to "hog off" several acres of fine Indian corn that is "earing" out in good shape. Mr. Beckman is one of many Lodi farmers that have put down wells to help out the empty ditches.

M. A. Perkins, the cattleman of Yavapai County, Arizona, has just sold 1000 head of range cattle to Chicago buyers, the three grades of steers bringing $64, $54 and $38 per head.

The Conejo Ranch has entered two carloads of fancy pedigreed and pure bred hogs at the California state fair, one carload of 60 individual animals to be shown in practically all classes of the Hampshire and Duroc-Jersey swine; the other in the fat class and judged under the carlot division. The Conejo Ranch swine entries at the 1917 state fair captured over 40 ribbons and prizes. Conejo Ranch champions and prize winners will also be very much in evidence at the California Liberty Fair, which is to be held in Los Angeles in October. The management plans to show two carloads of pedigreed and pure bred hogs and a carload of fat hogs in the carlot class.

Prizes offered in the beef Shorthorn classes of the California State Fair's live stock show, August 31 to September 8, have been increased from $1875, as listed in the premium list, to $2187.50. The additional money is offered as the result of action taken by the American Shorthorn Breeders' Association. The association previously had agreed to pay one-third of the awards in the Shorthorn section, or $625.

Kings County's Poland-China Breeders will hold their sixth annual sale of "good ones" on Wednesday, Oct. 9, 1918. These sales are always successful. They distribute splendid

stock at farmer prices. There is always a big crowd but not too big to be fed right royally with a regular farmer dinner. Everybody comes and everybody enjoys himself. Col. Ben A. Rhoades will officiate as usual.

Mark Bassett, J. M. Bernstein, W. L. Haag & Son, and Dimmick Brothers will show Poland-Chinas at the state fair.

Fred Ross has a fine big type junior yearling boar, Rossmead Big Bob, and some extra quality young stock. Owing to difficulty in securing labor he will not show this year. A young Holstein bull on the Ross ranch is a pleasure to look at.

The Lendorris Ranch of W. L. Haag boasts some splendid Poland-China young stock and sows headed by Young Jumbo, formerly owned by Will Bernstein. Visitors at the state fair, don't fail to see him for he's good in all almost every way.

A visit to Mark Bassett's farm is always a treat to a lover of fine hogs. This year the show is probably the best ever. The senior herd sire, Model Fellow, will be a hard one to beat in any show ring, while his get in every class are sure to bring home ribbons of the right color. The showing at the state fair will be worth going far to see. "Archie" says it is the best ever.

Dimmick Brothers of Lemoore got started as Poland-China breeders by the boys pig club route and are now among the leaders in the business. Model Wonder this year and some other good ones.

W. D. Trewhitt of Hanford will reduce his herd of Big Type Poland-Chinas Sept. 26 by selling at auction 63 head of bred sows and gilts and open gilts. Only three boars will be sold. All the offerings will be quality stuff and it's an opportunity to get some good ones.

Consignors at the sixth annual sale of the Kings County Poland-China Breeders' Association at Hanford on October 9 are M. Bassett, W. Bernstein, J. A. Crawshaw, F. D. Ross, Trewhitt Bros., J. M. Bernstein, Dimmick Bros., C. A. Vaughan, W. L. Haag & Son, C. G. De Raad, W. S. Hubbard & Son, E. G. Myer, H. D. McCune.

Dairy of Geo. E. Platt, Los Angeles County
Note cars loaded with silage for evening's feeding.

A Letter from Humboldt

ANSWERING a question as to the feeding of silage J. W. Coppini of Humboldt County, a winner of one of the California Cultivator $100 prizes in the recent state dairy cow competition, writes:

"I never had a silo nor contemplated building one. Fortunately in my locality we can almost at any time go out and cut green grass and clover until late in August. Then we depend on roots such as carrots, etc."

Mr. Coppini is also a believer in the pure bred as a means of securing greater production:

"It will undoubtedly be interesting reading to the promoter as well as to the supporter of the last state dairy cow competition to know of some particular instance where the contest did directly some good. As already stated I was the winner of the pure bred Ayrshire bull calf donated by J. W. Clise of Redmond, Washington. The calf was shipped to me in due time and in justice to the donor I must say that it was a splendid individual and bred in the purple.

"Not wishing to change breed I in turn donated him to the Red Cross, and he was auctioned off at Loleta on June 8 last. Unfortunately his good breeding was not recognized, therefore not sufficiently appreciated, and he sold for only $125.

"The purchaser was J. A. Genzoli of Loleta. Since he became possessor of the pure bred bull calf he has decided to enter in the pure Ayrshire breed, and recently purchased from Mr. Clise three two-year-old heifers safe in calf, and in a very few years Mr. Genzoli will have a fine herd of Ayrshires. As I have repeatedly said if there is one dairyman in the state that did not profit by the state dairy cow competition he must admit that it was his own fault, and much credit is due to all those that made the competition possible."

There is also in the above a hint to the breeders of pedigreed stock. Simply as an advertising proposition Mr. Clise' offer of one of his pure breds in that prize competition resulted in some satisfactory sales of other stock.

SHORTHORN ACTIVITIES

Present indications point to a most comprehensive exhibit of Shorthorns at the state fair this year, and it is probable that the exhibits will at least compare favorably with, if not excel, the wonderful show of last year. The Shorthorn men will have a get-together evening at Sacramento during state fair week to discuss plans for the ensuing year, and entering largely into this meeting will be a discussion of ideas for augmenting the output with which to supply the increased demand.

The realization of the need for more and better cattle is becoming apparent throughout the state. There will probably come before the legislature at its next session a bill requiring the use of pure bred bulls of beef type on the open ranges. It is possible that an early winter sale of Shorthorns will be held. There are two or three new herds in prospect in the state. The cattlemen of the state are well on the way to becoming thoroughly organized and as a result improved methods are becoming more generally known.

Every year hundreds of thousands of wild ducks die in the Salt Lake Valley of Utah. Government experts have determined that the trouble is due to alkali poisoning because the birds get so little fresh water for drinking.

Prince Gelsche Walker Korndyke
Shown Above

We are carefully building the best Holstein herd we know how to build, keeping in mind uniformity of breeding and blood lines that have fully proven their worth in the advancement of dairy production, and our herd and methods seem to meet with the approval of large numbers of California dairymen and breeders who have kept us sold down close on breeding bulls.

We also appreciate the demand that has come to us from long distances, including two sales in which Jane Garden Farm Holsteins take their places in the black and white army that is crossing the Pacific. We recently made these deliveries:

1—A son of **KING KORNDYKE PONTIAC** to the Japanese Government.
2—A son of **PRINCE GELSCHE WALKER KORNDYKE** to the University of Hawaii at Honolulu.
3—A son of **SIR AAGGIE DE KOL ACME** to the State of Idaho.
4—A son of **KING KORNDYKE PONTIAC** to Richmond, Utah.

King Korndyke Pontiac and Prince Gelsche Walker Korndyke are both siring calves that come fully up to our high standards, and we expect unusually good things from the offspring of Sir Aaggie De Kol Acme to whom we are breeding many of our best cows and heifers.

JANE GARDEN FARM
TRADE MARK
NEVER FAIL TO FILL THE PAIL

We would like to have every breeder and dairyman see our farm and herd, and judge for himself the high quality of our cattle and methods of handling them and conducting our breeding business.

Dairymen who want real bulls to head their herds should keep in mind that we are breeding the right sort and that our prices and terms are most liberal.

Just run out to Jane Garden Farm during State Fair week. There is a new paved road all the way and you will find it one of the most interesting drives out of Sacramento.

Unsigned communications receive no attention.

Worms in Puppies

Can you tell what is wrong with our puppies? My bitch has six fine puppies about two months old. They are growing some but are thin in flesh and have large stomachs. They have a good appetite and are always hungry, but their food does not seem to do them much good. Could such young animals get worms?—Subscriber, San Fernando.

It is difficult to tell how they get the worms but young puppies often have them and the symptoms are just such as you describe. It is probably the small round worms about one sixteenth of an inch thick and two or three inches long or it might be tape worms. Any of them develop very quickly once they are established in the stomach and bowels. You can cure them of either in a short time by giving powdered areca nut in a little milk. Give the six half a teaspoon of the areca nut in a pint of sweet milk in the morning before feeding anything else. Repeat this every morning for a week and longer if you think best. The areca nut is nearly tasteless and not poison so you need not fear hurting the puppies. They will lick it up with the milk and never know it is there.

Spavin

We have a four year old colt that is lame in the left hind leg. It seems to have no use of the coffin joint. It steps on the toe and is lame when it trots. Has been lame for nearly a year. We fear the joint has become stiffened. Do you think I could cure it by putting on a long shoe and using caustic balsam? I am a blacksmith.—Subscriber, Coachella.

Since you say there is no swelling the trouble is probably in the hock joint. Spavin will often cause lameness for a long time before the swelling shows. It will make them start off on the toe and limp when trotting as you describe. Or if the colt walks on the toe at all times it may be contraction of the back tendons. Contracted tendons would need a long shoe with no heels but a spavin would need a short shoe with high heels. If it is contracted tendons then blister with caustic balsam as you suggested but if it is a spavin blister with cantharides and biniodode of mercury; two drams of each mixed with three ounces of lard. Rub it in well and repeat in two weeks. You will have to decide which of the two troubles it is. When you blister keep the horse tied so he can not rub it with his nose for 24 hours so he will not get his nose blistered too, then grease it with lard and turn him loose.

YEARLY RECORDS BEING MADE AT TULARE HOLSTEIN FARM

A number of very pleasing yearly records are under way at Tulare Holstein Farm, owned by W. J. Higdon, Tulare, under the care of Harry L. Redd, herdsman.

Hertinga Willis, a six year old, has made 14,351.9 pounds milk and 558.07 pounds butter in her first six months.

Coloma Beauty Maid, the great heifer that made over 19 pounds butter in seven days as a senior yearling, is now milking as a junior three year old; at the end of five months has 10,967 pounds milk and 444.69 pounds butter to her credit and as she is a stayer should finish her year with a big record.

The outstanding record of the group on test is being made by the great junior two year old, Madrigal Mooike 2nd. At the end of six months she has 13,196.8 pounds milk and 478.98 pounds butter to her credit and is holding up splendidly even during the hot weather.

CUT OUT THE BACK TEETH

Before placing the pigs with the sow, cut out the eight small tusk-like teeth. There are four of these on each jaw in the rear of the mouth. These teeth are very sharp, and if left in the pig's mouth they will likely cause tearing of the sow's udder, and the little pigs cut one another's mouths while fighting for a teat. These teeth can be removed with bone forceps, wire nippers, or with a knife. Never pull out the teeth. Always cut or break them off. After this operation is over, place the pigs with the sow, care being taken that each one gets to a teat. When the after-birth is passed, it should be removed from the pen at once and buried or burned. There is good reason to believe that eating the after-birth is often the beginning of the habit of eating pigs.

As a rule, the sow should have no food the first 24 hours after farrowing, but should be given a liberal drink of warm water. If, however, she shows signs of hunger, a thin slop of bran and middlings may be given. The feeding for the first three or four days should be light and the time consumed in getting the sow on full feed should be from a week to ten days, depending on the size and thrift of the litter.

Let's remember in this sugar fight that the motto of Foch is "Attack," and the method of our boys, "Fight as long as the fighting is good—and then some more." So "Up and at 'em."

FOR MILKING MACHINES

Clear and Clean as Water

B-K keeps tubes and cups sweet and clean. Penetrates milk solids—kills the bacteria. Is clean—harmless—cannot taint milk. B-K makes rubber parts last longer—cannot harm metal. Be Successful

Success in the dairy business comes only to the man who operates with good cattle, and good cattle are produced through careful selection of breeding females and the mating of them with bulls of proven breeding.

Do away with the hazards you are taking through the use of a scrub bull or one of inferior breeding, and let us furnish you with a sire that will breed real quality into your herd.

Every one of our five herd sires is a son of a world's record maker or has himself sired a world's record Daughter.

Prince Gelsche Walker

Northern California Notes

Written for California Cultivator by W. S. Guilford

BARLEY GROWERS ORGANIZE

BARLEY growers of the Sacramento Valley have been expecting that the crop would bring at least $3.00 per hundred this season. The cost of everything that has entered into the cost of growing, labor, supplies, etc., has been high, and the prices of all other commodities are high. Practically all of the insurance written on barley in the field—insurance against fire—was written on a basis of $3.00 per hundred. In several conferences with the food administration barley growers report that no encouragement for a $3.00 or better price has been given, hut that they have been given to understand that the price will probably be considerably less than that.

An organization of the barley growers of the state is now heing formed, the ohject of which is to try to get a fair price for the crop.

FREE TRANSPORTATION TO STATE FAIR

It was announced a short time ago that exhibitors of live stock would not be allowed to ship stock free to the fairs, as has been the custom for years. This ruling has been changed and the free rates will he allowed as heretofore. The passenger rate will he fare and half for the round trip.

GOVERNMENT LIVE STOCK WORK

John T. Caine III., director of agricultural extension in the Utah agricultural college, has heen appointed by the secretary of agriculture as a specialist in animal husbandry in the department. The United States department is to cooperate with the states in animal husbandry extension work. Professor Caine will have charge of the western field. He is one of the big men in animal husbandry work in the United States and we will be glad to see him in California often.

WHEN TO SOW ALFALFA

Alfalfa is at a big premium this year and a big acreage will be sown this coming season. We have some land which was prepared for corn. The moisture got away too fast, and we did not get around to irrigate it. There is a splendid seed hed. We have been talking about seeding it early this fall and depending on the first rains to start it while the soil is warm. If we do this there is danger that the first rain might start it and a succeeding dry spell kill it out before more rains came. But if we wait until after the first rain, and more follow in quick succession, we might not get it sowed until the ground is cold and the winter growth of bur clover and other plants start, and the alfalfa may be choked out before it gets started. This is on river bottom land that does not need irrigation except in very dry years.

With a problem like this in mind it is natural to talk with everyone who has had experience with alfalfa. I asked Captain Jones who has a fine field near Butte City; "When is the best time to plant alfalfa?", and he said, "I don't know any hetter answer than one I got many years ago from a successful grower in Kern County. He said, 'Plant it when you get your ground ready.'"

The experience of many years in this valley shows that there have been good stands secured when the seed was planted during almost every month in the year—and likewise failures. Much depends on the seed bed, and much depends on other conditions. The only sure way to get a good stand is to keep everlastingly at it, and when a spot needs fixing up and reseeding, fix it up. The securing and maintenance of a good stand of alfalfa requires continuous work and care.

Classy Holstein Heifers
In the pastures of Alex Whaley.

MARK PIGS YOUNG

I have just been marking a litter of pigs. They were born yesterday. We use a system of notching that numbers them up to 999, and we number all of the pigs in a litter the same number. This identifies them until the end of the year, and by that time many of them are sold. Those that go into the herd are then renotched so as to prevent any confusion with the litter of the succeeding year which would have the same notches.

The time to do this notching is when the pigs are very young; it can be done the day they are born, but it should always be done within a day or two. Then there is very little blood in the little pigs' ears, and the little fellows hardly notice it. When they are older they are harder to handle; it hurts them more and there is more bleeding. The notches grow out with the ear so that a small nick or notch serves for identification.

Where hogs are not numbered with notches, but all of the hogs on a ranch get the same mark, this early marking has the same advantages as with registered animals.

CALIFORNIA GREAT BREEDING GROUND

California pure bred live stock continues to make good. At the recent fair held in Hawaii the winning aged Holstein hull was bought from Morris and is sired by F. W. Kiesel's King Korndyke Pontiac.

Berkshires shipped recently from Anchorage Farm at Orland to Idaho and Utah bring back letters of the highest praise from the purchasers.

The stock being prepared by the University Farm for show at the fairs this fall is of wonderful excellence; there is every reason to believe that

Butte City Ranch

Shorthorns, Berkshires, Shropshires, Ponies

Our cattle, hogs, sheep and ponies are grown under natural conditions—are not pampered. They make good for those who buy them. We have bought the best for foundation stock, and select breeding animals with great care. We know that it is to the interest of every one in the market for stock of the breeds we raise to write for descriptions and prices before buying.

Butte City Ranch, Box C, Butte City, Glenn Co., Cal. W. P. Dwyer and W. S. Guilford, Owners

it will uphold the reputation of the institution.

Raphael Larco of Peru has recently purchased a number of Holsteins, Herefords, Percherons and Poland-Chinas for shipment to South America.

This demand for California bred and grown stock from distant parts of the United States and of the world will continue. With the opening up of greater world trade in all lines there is a rich harvest in store for enterprising breeders of registered live stock.

THE FARMERS' SHORT COURSES AT THE UNIVERSITY FARM

The short courses will be held this year during the period September 30 to December 13. Between these dates ten different courses will be given: September 30-November 8, general agriculture (including animal husbandry), horticulture, poultry husbandry, and dairy manufactures; November 11-22, market milk production, butter making and gas tractors; December 2-13, cheese-making and milking machines (latter only on condition that 12 students are enroled prior to November 25); December 2-7, beekeeping.

A circular giving general information concerning the different courses, admission, expenses, etc., has been issued by the college of agriculture, and also the daily schedule of lectures, demonstrations, and practice periods for each day of the various courses. Both these circulars are sent free upon application.

Farmers who are so situated that they can attend one of the short courses will do well to write for copies of the circulars and post themselves as to the opportunities these courses offer for increasing one's knowledge of farming along both practical and theoretical lines. It cannot help being of great assistance to farmers who are anxious to secure better returns for their labors than in the past. With present and prospective high prices for labor and the necessities of life, the chances for making money in any branch of agriculture are rather poor unless one takes advantage of the best agricultural knowledge available and follows up to date modern methods. There is no better, cheaper, or quicker way of securing this information for the practical farmer than to attend the short course dealing with the special branch of agriculture in which one is interested. Moreover, it is a patriotic duty and backing up our boys in the trenches, to learn how to increase crop production these times, and—it will pay well.

FODDER SUBSTITUTES

A reed flour for fodder was put on the market in France this February. Reeds are also used in Germany. Their collection and sale is regulated by the government, and a maximum price of $1.25 per hundred weight is fixed. For acorns, horse chestnuts and seeds of forest trees the French government has issued full information as to use for substitutes. Acorns may be eaten by all animals, though in differing amounts. For horses, seven pints of acorns are equal to five and one-fourth pints of oats. Acorn feeding should be suspended for a week after continuous use for a month. Horses and cattle should have raw acorns crushed and the husks removed. For pigs, the acorns should be crushed into a coarse meal and mixed with cooked potatoes, or cooked with potatoes.

The use of foliage, twigs and young shoots of trees and shrubs has been largely developed in Germany since 1916. The cuttings of all trees and shrubs may be utilized, with the exception of bird cherry, laburnum, ivy, acacia and alder. The material should be collected in the winter before the buds burst. Sheep and goats can eat it unchopped; for other uses it should be cut fine in a chaff cutter and used wet or dry; but it must be kept dry if preserved at all, otherwise it will mildew. This year it will be collected officially in Germany.

The German Leaf Fodder Office states that "the young spring leaves are the most valuable for the making of leaf fodder, as the cellulose is still tender and soft and its layers supple and alive. The cells are full of life and filled to the utmost with plasma and sap. They are rich in salt, starch and sugar. Hence, it should be collected chiefly during May and June, as it contains more nourishment then than later in the summer. Ten hundredweight of leaf fodder collected in May and June contain the same amount of digestive matter as fourteen hundredweight collected in the autumn. It is also more nutritious then, gives the horses an appetite, strengthens their digestion and is good for their health." The only fodder substitute of this sort used in France to any great extent is vine waste.

Pine and fir needles have been used in Sweden, potato tops in Norway, hazel catkins have been dried and used as a sort of fodder flour in Germany, and in Austria-Hungary stinging nettles were being resorted to last January. Perhaps the strangest fodder substitute of all, however, is cockchafers, a kind of beetle which are being collected throughout Germany and Austria by school children, and are reported to be excellent food when dried, for pigs and poultry.

FRENCH LIVE STOCK LOSSES

Since the war began France has lost heavily in all classes of stock. It had on December 31, 1917, two and a half million less cattle than on December 31, 1913; nearly ten million less sheep; more than four million less hogs.

Warehouses are overflowing with barley.

DUROCS IN SAN DIEGO

R. K. Walker of the Peters, Lamson and Walker Company, writes that part of the activities of that company have been transferred to Bonita, some ten miles from San Diego, and that the place will soon be stocked up with a great number of high class Durocs. To break in the new quarters a stock of 750 feeders is being handled. Later it is expected to transfer the activities entirely to pure breds.

Italian residents of Sonoma County met at Healdsburg August 4 to protest against prohibition enactments. Formal resolution was wired to President Wilson.

A CYCLONE SILO Will Save You Big Money On Your Feed Bill

If you are in the farming business to make money you must save as well as earn—a silo will save you its cost in the first year of its use. With a silo you can convert into first-class stock feed a lot of your product that you have wasted in the past—

The CYCLONE SILO

—is constructed to stand up under the most trying conditions. Flat-iron bands encircle the CYCLONE (as illustrated) in such a way that it cannot possibly twist or warp out of shape—does not get smaller at top than bottom after usage. No guy wires to stumble over.

We, who make this silo, have been manufacturing wood tanks, wood stave pipe, etc., for use in all parts of the world for 25 years—we know our business and our guarantee that this silo is right means something.

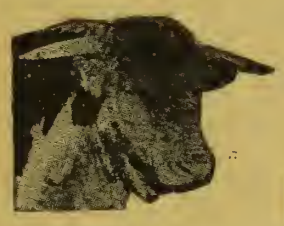
ECONOMY STOCK POWDER

Conditioner Worm Expeller Disease Preventive

For: Horses, Hogs, Cattle, Sheep

Not a Stock Food, but a Medicine. Not a Panacea, but a Remedy. Not a Medicated Salts, but purely a Medicine composed of the very best and choicest of Herbs, Roots, and Sodas. Not a Cure-All, but a genuine conditioner containing TEN different ingredients, scientifically compounded. No Oil Meal, No Bran, No Salt, No Poisonous or Harmful Drugs or Stimulants, such as Arsenic or Black Antimony that will create a false appetite.

Time will prove whether an article is good or bad. Economy Stock Powder has stood the test of time. It is no longer an experiment, but a Compound of proven merit. Over 200,000 Farmers and Stockmen are feeding Economy regularly. A trial will convince you.



ECONOMY GERMICIDE DIP

Disinfectant—Germicide—Antiseptic

Will absolutely rid your hogs of parasites, lice, mange, scurf, and improve the coat of hair. Will not injure the eyes of the animals.

HAY

Under date of August 17, Scott, Magner & Miller says:
Receipts past week, 2184 tons. The market is still heavily stocked and it has been difficult to dispose of arrivals satisfactorily. Considerable hay has had to be left on the tracks longer than the free time allowed by the railroads and has therefore been subject to demurrage charges. This causes trade to be extremely dull and to place any quantity with consumers it necessitates cutting of prices which under the present conditions dealers are very backward about doing as all the hay arriving is that which has been purchased in the country districts at the high range of prices demanded by farmers throughout the summer months and to cut prices means a positive loss in most cases to the consignees.
Alfalfa is arriving freely from the river districts together with considerable of the interior hay coming in by rail. Demand for this has also decreased, no doubt owing to the high prices. Considerable newspaper reports have appeared regarding demand for straw during the week, but as far as this city is concerned there is practically no straw being used or sought. The market is simply nominal.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market — for prices to consumers charges of cartage, commission and handling must be added according to conditions:
Fancy Wheat Hay
(large 5 wire bale) .....26.00@27.00

Rape .....2½@5

Citrus Fruit Market

Los Angeles, August 21, 1918.

Valencias are still selling at long prices with no indication of weakening or reduction. This, notwithstanding this is the period of lightest demand. Shipping has also been lighter than usual.
Florida's new crop will begin going to market about October 1. Its estimates call for 5,000,000 boxes of oranges and 5,000,000 boxes of grapefruit.
California grapefruit is demanding better prices and its high quality is making for future markets. Lemon market is exceptionally strong.

Shipments

Shipments of citrus fruits to date since November 1, 1917; Southern California; oranges 13,010 cars, lemons, 5018, total 18,028. To same date last season, oranges 36,420, lemons 7235, total 43,655. Central California this season; oranges 2536, lemons 115, total 1650. Last season to same date; oranges 4665, lemons 164, total 4819. Northern California; oranges 203, last year same date 845.

August 19
New York: 11 oranges, 3 lem. 2 grapefruit. Val. 5.05-9.75, lem. 7.10-8.25, grapefruit 3.95, halves 1.60-2.95.
Pittsburg: 2 Val., 5 lem. Lemons lower. Val. 3.90-8.80.
St. Louis: 1 Val., 2 lem. Val. 6.15-7.50, lem. 3.25-7.70.
August 20
New York: 8 oranges, 2 lem. Val. 6.75-9.75, lem. 7.65-8.10, grapefruit 2.50-3.10, halves 1.50-1.75.
St. Louis: 1 car oranges and grapefruit, 1 lem. Val. 3.85-7.50, grapefruit 1.60-2.30, lem. 5.00-5.30.
Boston: No sales, no receipts.
Philadelphia: 2 oranges, 2 lem. Val. 6.10-9.40, lem. 7.15-8.90.

NEW FEATURES

1919 Bean TrackPULL Tractor

Important improvements embodied in the 1919 "Bean" increase its efficiency by adding from two to ten times the wear resisting strength of the parts affected. The 1919 Bean TrackPULL Tractor is the same design as the 1918 model, save for these valuable new features.

These improvements added to the long proved design of the "Bean" make it a marvel of reliability and efficiency.

1919 Valuable Improvements

1. Motor—Improved oiling system. Improved carburetor control.
2. Track Rollers—Provided with hardened steel thrust bearings.
3. Drive Sprocket—Solid steel ring, machine cut hardened and heat treated assures long service.
4. Bearings—Provided with improved dust protected greasing facilities.
5. Rear Wheels—Provided with dust cap, wear resisting bushings and improved greasing facilities.

These, and many other features, are fully described in our new tractor catalog. Send for a copy before selecting your tractor.

See the 1919 model "Bean" at the Sacramento State Fair, August 31st to September 8th.

Bean Spray Pump Co.
Dept. J, San Jose, Calif.

Player Music Rolls

Send for Our Catalogs

We carry the largest stock of Player Music Rolls on the Pacific Coast. We have in stock all the new music. We get the hits as fast as the manufacturers make them into player rolls.

We issue a Monthly Bulletin listing only the real hits and the prices—the Bulletin is sent free and without obligation to purchase. We will gladly add the name of any Player Piano owner, upon request.

Write and ask us about our "On Approval" plan of buying Player Music.

When writing please state whether your Player Piano is a 65 note or an 88 note instrument.

We invite you to call at any of our stores—or write us asking for illustrated catalogues and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

Sherman, Clay & Co.

Kearny and Sutter Streets, San Francisco.
Fourteenth and Clay Streets, Oakland
Ninth and J Streets, Sacramento

AMERICA'S STARS

Written for California Cultivator
By Ella Williamson

When France first heard the coming storm
And felt its heated breath;
When over her beloved land
The lightning flash of death
Spread its destruction far and wide
O'er valley, hill and plain;
The cry arose; "They shall not pass,
The tyrant for his gain."

And like the oak she bore the test.
Deep rooted, firm she stands,
Though bent and bleeding from the foe
She still defends her lands.
But through the war clouds hanging low,
Hope shed her light afar,
For, breaking through the gloom, she sees
America's wondrous stars.

A million stars appeared in sight,
And millions more will rise.
O France, take heart; thy succor comes;
Their splendor clears the skies.
You'll rise from ruined homes again,
Unfettered safe and free.
Your children's voices then shall ring
With joy and liberty.

THE SEQUOIA NATIONAL PARK

AND they said, Go to, let us build us a city and a tower whose top may reach unto heaven."

Thus is recorded, in the eleventh chapter of Genesis, the building of the Tower of Babel. While this tower was doubtless still standing, and a hundred years or two before the birth of Abraham, a tiny seed in the warm soil of a mountain slope on quite the opposite side of the world thrust into the light of day a slender green spike which was destined, during an existence of more than four thousand years, to become itself a lofty tower; noble in form, "with a physiognomy almost Godlike," as John Muir puts it, pulsating with life to its topmost leaflet more than three hundred feet above the ground, and giving forth a babel of bird song to the accompaniment which the summer winds played upon its many millions of tiny leaves.

On the stump of this prostrate sequoia tree, one of the noblest of the celebrated Big Trees of California, John Muir counted more than four thousand rings, a ring for every year of its life. Its trunk, exclusive of bark, was thirty-five feet eight inches in diameter. As the bark of the very largest sequoias is two feet or more in thickness, this giant must have measured forty feet in diameter when it was still growing on one of the slopes of the Kings River.

In the Sequoia National Park, upon the upper slopes of the Sierra Nevada Mountains in central California, and in the little General Grant National Park six miles away and under the same management, grow 1,166,000 sequoia trees, of which 12,000 are more than ten feet in diameter. Some of the others have these dimensions:

General Sherman Tree: Diameter, 36.5 feet; height, 279.9 feet.

General Grant Tree: Diameter, 35 feet; height, 264 feet.

Abraham Lincoln Tree: Diameter, 31 feet; height, 270 feet.

California Tree: Diameter, 30 feet; height, 260 feet.

George Washington Tree: Diameter, 29 feet; height, 255 feet.

William McKinley Tree: Diameter, 28 feet; height, 291 feet.

Dalton Tree: Diameter, 27 feet; height, 292 feet.

There are sequoia trees of great size in several other parts of California also notably in the Yosemite National Park, where three distinct groves are found; but by far the greatest number, and the individual trees of greatest size, are in the Sequoia National Park and its litle neighbor.

It is extremely difficult to realize what the dimensions of these trees really mean.

To visualize as best you can the greatest of those now standing, the General Sherman Tree, measure off and stake its diameter, 36 feet 6 inches, upon the ground in front of a church the height of whose steeple you can readily asecrtain. Then stand back a distance equal to the height of the tree, 280 feet, and look hard at the stakes whose distance apart represents the thickness of the trunk.

Now raise your eyes slowly, imagining this trunk rising in front of the church, tapering very slightly as it rises. When you are looking upward at an angle of forty-five degrees from the spot where you are standing (and this will not be difficult to calculate) you will be looking at the point where the top of the General Sherman Tree would be if it were growing in front of your church instead of in the Sequoia National Park. The known height of the steeple will help you verify this calculation.

It will help your comprehension of the great size of these trees to know that a box big enough to have easily held the ill-fated ship Lusitania, one of the largest ever built, could be made from inch boards sawed from any one of these great sequoias, with boards enough left over to build a dozen houses. Automobiles and six-horse teams have been driven up and down the fallen trunks of several great sequoias, and there are regular wagon roads running through gaps in the trunks of others in our national parks. Two parallel street car lines and a driveway might be run through

A Better-Furnished Home Will Help You

Speed Up Work At Harvest Time

Crops must be gathered QUICKLY. "The American Farmer must feed the Winners or the German Farmer Will." There's so much work to be done and so little time in which to do it. A better-furnished home will help you speed up work at harvest time.

Use the wind for pumping

-costs $1.65 a year

ECLIPSE Wood Windmills will do your pumping and save you a lot of money each year. They have been sold for 50 years and we know of farmers who have

ECLIPSE MILLS
—over 38 years old

still pumping *today—with no repair bills.* That means reliable water supply for 38 years at about $1.65 a year, figured on actual yearly service—not first cost.

The ECLIPSE is a time tried mill. Its solid construction makes this pumping record possible. Automatically turns in and out of wind—practically storm-proof. Direct stroke, no gears—but little friction—noiseless—needs only occasional oiling.

Talk over the ECLIPSE Mill and Tower with your dealer and you'll buy an ECLIPSE—like thousands of other farmers.

FAIRBANKS, MORSE & CO.

the trunk of several of the very largest.

But the age of the sequoia is still more difficult to realize. It is beyond compare the oldest living thing.

Several of the trees now growing in hearty maturity in the Sequoia National Park were vigorous youngsters before the pyramids were built on the Egyptian desert before Babylon reached its prime. Hundreds of them were thriving before the heroic age of ancient Greece—while, in fact, the rough Indo-Germanic ancestors of the Greeks were still swarming from the north. Thousands were lusty youths through all the ages of Greek art and Roman wars. Tens of thousands were flourishing trees when Christ was born in Bethlehem.

But with all its vast age, the sequoia today is the embodiment of serene vigor. No description, says Muir, can give any adequate idea of its majesty, much less its beauty. He calls it nature's forest masterpiece. He dwells upon its patrician bearing, its suggestion of ancient stock, its strange air of other days, its thoroughbred look inherited from the long ago. "Poised in the fullness of strength and beauty, stern and solemn in mien, it glows with eager enthusiastic life to the tip of every leaf and branch and far-reaching root, calm as a granite dome, the first to feel the touch of the rosy beams of morning, the last to bid the sun good night."

The sequoia is regular and symmetrical in general form. Its powerful, stately trunk is purplish to cinnamon brown and rises without a branch a hundred or a hundred and fifty feet—which is as high or higher than the tops of most forest trees. Its bulky limbs shoot boldly out on every side. Its foliage, the most feathery and delicate of all the conifers, is densely massed. The bright green cones are about two and a half inches long, generating seeds scarcely more than an eighth of an inch across. The wood is almost indestructible except by fire. Fallen trunks and broken branches lie for centuries undecayed and almost unaltered.

The sequoias are the glory, as they were the cause, of the Sequoia National Park. Scattered here and there over great areas, they cluster chiefly in thirteen separate groves, and it is in these groves that they attain their greatest size and luxuriance.

But they are by no means the only attractions of this national park, which many frequenters declare nature has equipped best of all for the joys and pleasures of mountain living.

It is the ideal place to camp out. It is a country of magnificent mountain scenery, easily accessible when once you are in it. Its peaks are among the loftiest, its canyons among the deepest and most romantic. Its summer temperatures are even and bracing. Its summers are practically without rain.

Across its borders north and east opens up a mountain region, on the crest of the Sierra, of unexcelled grandeur. Mount Whitney, the highest mountain in the United States, 14,501 feet, lies upon its eastern boundary. The Kings and the Kern rivers have few scenic equals. These and its many other rushing streams abound in trout.

CONTAINERS OF CANNED AND DRIED FOOD

Do not use tin containers that cannot be made airtight or are likely to rust. Much spoilage has been caused by these defects. Use non-tin containers as much as possible. The world's tin supply has been practically stationary for some years, while the demand has grown immensely. Next year the army and navy requisitions of canned goods may be so great that much less tin will be available for household use.

Wide-necked bottles and seal stone containers—will take care of everything except large fruit canned whole. Your grocer may be able to furnish discarded candy buckets and butter tubs for salting down vegetables. Many containers in which commercial food products have been bought are suitable for storage of home products. If you find you have more containers than you need, share with your neighbors.

Bottles—Narrow-necked bottles may be used for fruit juice, tomato paste and catsup. Wide-necked bottles are suitable for preserves, pickles and vegetables. Fruit and vegetables bottled, corked and sealed with sealing wax keep if the usual canning directions are followed.

Boxes—Tin, wood and pasteboard boxes may be used for storing dried fruits and vegetables after they have been properly conditioned. If a large box is used, place the dried vegetables in small paper bags carefully tied and brushed with paraffin before storing in boxes. Paste paper over the edges of boxes to protect from insects and moisture. Label all packages.

Cans—Pressure lid cans, coffee tins and lard buckets with tight covers are excellent for dried fruits and vegetables. Condition all products carefully before storing. Paste thin paper over the joints.

Jars—If jam is put up in glass jars with metal screw tops, cover the fruit with paraffin and place cardboard and wax paper in the cover. Stone jars in which fruit butter is sold have fitted lids and can be resealed with sealing wax. Wide-mouthed stone jars should be used for the last fruit in autumn. Use these preserves first in winter.

RED CROSS DOGS

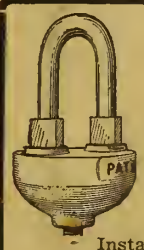
A letter from a young Harvard man in the American ambulance service in France which is quoted in the New York Sun, gives an interesting glimpse of the wonderful cleverness of the war dogs.

Last evening, he writes, a couple of fellows came round to see us, bringing with them two of the famous Red Cross dogs. We were anxious to see them work, and so I ran off and hid in some bushes.

Lying down, I placed my cap under me so that the dog could not find it. They sent one of the dogs out to find me. He finally discovered me; and as he was unable to find my cap, he put his nose in my pocket and pulled out my handkerchief, which he took back. A few minutes later he led his owner to the place where I lay.

They told us that this dog saved 150 lives in one day during the battle of the Marne.—Youth's Companion.

Housework may be made attractive to the little girl, and the mother who fails to impress the importance of domestic science on her child is robbing her of her chance for future happiness.



Fuel Relief Permitting Thrift

It has always remained for the simple little things to solve the big problems. It's the "Now, why didn't I think of that myself" sort of thing that is always doing the wonderful that seemed so impossible.

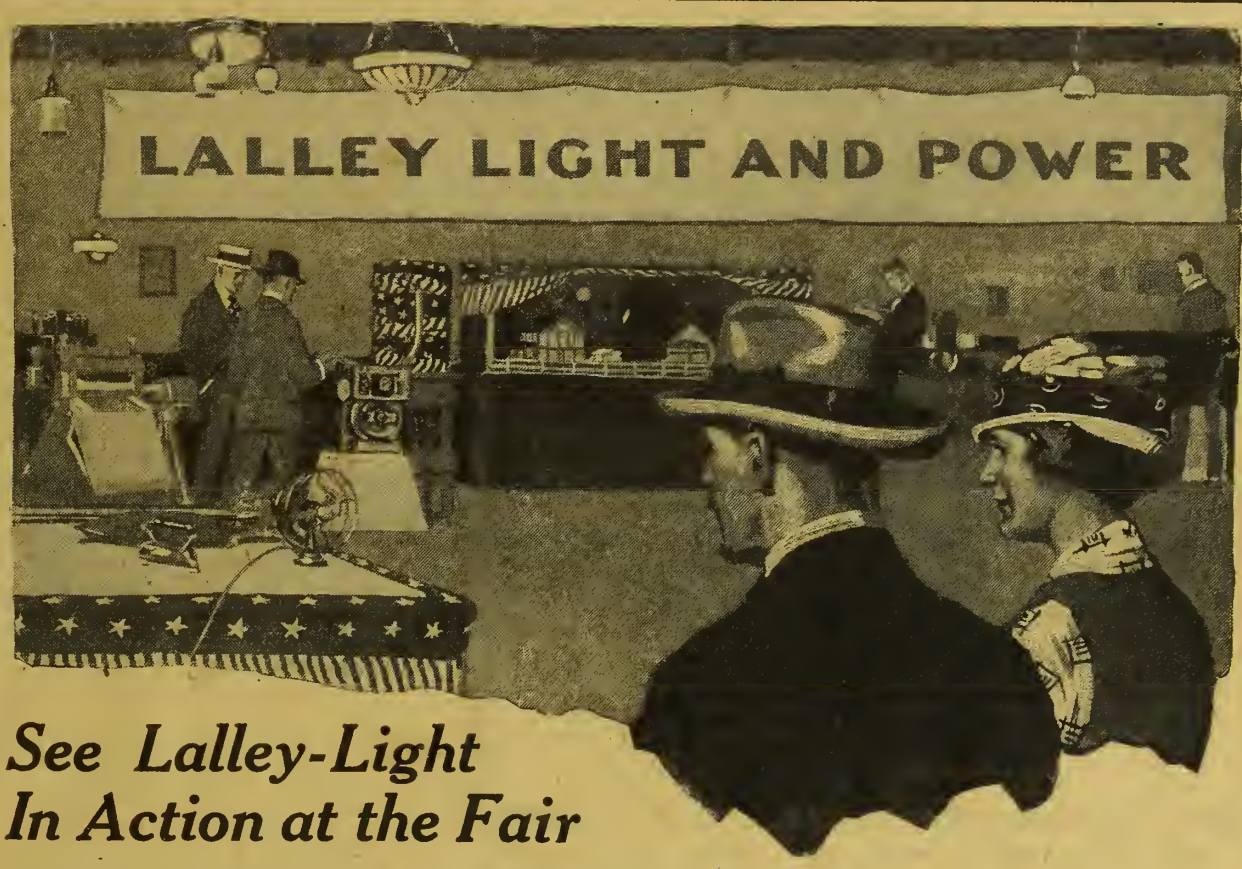
That is how "the simplest thing in the world" was discovered—the Premier Burner—and now after all these years of effort and "false alarms" in home gas makers, it has remained for this simplest of them all to solve the problem.

Installed in the stove without the aid of a plumber or any changes being made, operated on gravity feed and producing a clean gas that results in a bright, clear flame carrying the highest degree of heat units—all from just common kerosene oil and a simple little $5.00 burner—is it any wonder that people marvel, that users are our best advertisers and that it has been necessary to increase our output many times?

Those interested in real fuel thrift—more heat for less money—avoiding a difficult situation and accepting one of clean abundance furnished by kerosene and a **Premier Burner**, write for Free Circular "D." Burner for cook stove or heater by parcel post prepaid to any address upon receipt of $5.00. Full instructions and a wide-open guarantee with every burner.

PREMIER BURNER CO.

Home Office and Factory, 246 South Spring Street, Los Angeles, Calif.



See Lalley-Light In Action at the Fair

Lalley-Light will be exhibited, and in operation, at most of the county and state fairs this fall.

We ask you to note particularly the way it runs, and the character of the electric light and power it produces.

If you will do this, we count on the plant itself to convince you of the superiority it has proven in eight years of every day farm use. You probably will be impressed, first, with its extremely smooth running; and the fact that a low hum is all you hear when it is running.

You will see that the electric lights are strong and steady all the time — without even a suggestion of a flicker.

You will observe, also, the same steady flow of power to the electrical machines which may be exhibited.

The men in charge will explain that Lalley-Light furnishes light and power from two sources—the storage battery; and the generator, independently of the battery.

That means with Lalley-Light you are doubly sure of having light and power.

Even if you are not of a mechanical turn, you can't help admiring the unusual simplicity of the plant, and its very compact design.

We urge you to study Lalley-Light, because it points the way to a great saving of farm labor and an equal increase of comforts and conveniences on the farm.

Next year the farmer's need for Lalley-Light's reliable, economical power and light will be even greater than this year.

You should prepare now to meet that need.

If Lalley-Light should not be displayed at your home fair, write to us for details and name of the nearest Lalley-Light merchant.

Lalley Electro-Lighting Corporation

774 Bellevue Ave. Detroit, Mich.

Egg Machines

Written for California Cultivator By Jean A. Koethen

NOBODY would ever think of calling one of our good old Orpington or Plymouth Rock hens an egg machine. A cheerful producer of eggs she certainly is, doing her bit summer and winter, a devoted mother, incubating and brooding the rising generation with the tenderest care, a loyal and intelligent (yes, that is the word, in spite of the jokes of the scornful) member of the family, and withal a toothsome fryer in her callow youth, an inviting potpie in her old age and a delicious roast all the way between, but an egg-machine never. That honor is left to the flighty females of the so-called Mediterranean breeds.

One of the fundamental differences between the Mediterranean breeds, i. e. Leghorns, Anconas, Minorcas, Andalusians, Spanish and Buttercups, and those we have been considering is that the latter are not made breeds. When they were imported to this country from Italy and Spain they were very much such birds as they are now. Improvements have been made, especially in the Leghorns, but the Anconas we see in the shows are very like those which foraged about the little homes in the province of Ancona a hundred years ago.

According to the best authorities, the first recorded exportation of Leghorns from Europe to the United States was in 1834, nearly ten years before the first Cochins arrived. These birds are known to have been bred in Europe under the name "Italiens" some years before this, but the name "Leghorn" seems to have been given them after they reached America solely because the ship which brought them came from the Italian city of Leghorn and no better name for the birds was known. If the importer or breeder who gave them the name could have seen the far-reaching popularity to which this breed was destined he would hardly have been satisfied with the name of an obscure Italian town.

The first Leghorns imported into this country were of the Brown variety, and they seem to have led in popularity for at least fifty years. As late as 1896 they were classified as follows as to popularity and merit: Brown, first; White, second; Black, third; Dominique, fourth; Buff, fifth; Silver Duckwing, sixth. By 1904 the tide had turned and since then the Whites have rapidly risen in favor. They are the commercial egg breed par excellence and are kept wherever hens are kept in large numbers.

The Ancona is simply the common fowl of Ancona, Italy. Those exhibited in America are all black, mottled or spangled with white, but in Italy they are of several colors.

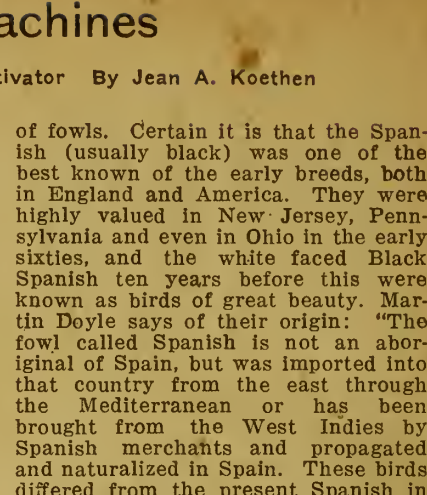
The Minorca may have had its origin in the Island of Minorca, but it was bred in England sixty years ago as the Black Spanish, red faced Black Spanish or Portugal fowl, and was long a favorite in Cornwall, Devonshire, Surrey and Sussex because of its remarkable prolificacy. The Minorca of today is larger than the old English Minorca, and this increase in size is due, it is said, to an infusion of Black Orpington and Black Langshan blood. The Minorcas, like the other Mediteranean breeds, are non-sitters and layers of white eggs, but the eggs are larger than those of most breeds.

The origin of the Andalusian is not clear. Mr. Weir, who has spent many years investigating the development of the various English and American breeds, made a trip to Andalusia in Spain to find out whether any blue fowls were indigenous there. He found blacks, whites, browns, reds and speckles, but no blues. The fact that some blue fowls were found in parts of England where they had evidently been bred for many years by other names complicated the problem, and he finally concluded that, since it is well known birds of a slaty-blue color are often the result of a black and white cross, these blues were probably originally produced from a cross of Black and White Spanish and were afterward gradually developed to a somewhat different type.

One of the earliest poultry writers, Bonnington Mowbray, writing in 1816, mentions the Spanish as one of the true varieties of the common species of fowls. Certain it is that the Spanish (usually black) was one of the best known of the early breeds, both in England and America. They were highly valued in New Jersey, Pennsylvania and even in Ohio in the early sixties, and the white faced Black Spanish ten years before this were known as birds of great beauty. Martin Doyle says of their origin: "The fowl called Spanish is not an aboriginal of Spain, but was imported into that country from the east through the Mediterranean or has been brought from the West Indies by Spanish merchants and propagated and naturalized in Spain. These birds differed from the present Spanish in having a smaller and less white face, darker feet and shanks. We find that previously to the introduction of the bird in question a diminutive species known as the Manx was the common class of fowls reared in Spain. These two breeds were crossed together, varieties were thus raised, and the present subvarieties of the Spanish fowl are partly the result." Lewis Wright, on the other hand, thinks they almost certainly came from the Spanish peninsula.

The Sicilian Buttercup is the last breed imported from the Mediterranean countries, and came, as its name indicates, from Sicily.

So much for the Mediterranean breeds. When we are speaking of egg machines, however, another breed and one that by reputation excels them all, must be included. This is the Hamburg. "Long before what we call fancy fowls were known or recognized," says Mr. Weir, "in fact, long before the memory of any person now living, Hamburgs were kept and bred to feather among the peasants of Yorkshire and Lancashire in England, and by them exhibited at the small town and country fairs in their neighborhood. Of course, they were then known under different names, the Blacks being called Black Pheasant Fowls, and the spangled varieties Lan-



Eggs all through the MOULT!
SHORTEN the moult and lengthen the laying. Globe A-1 Mash (dry buttermilk added) will do it. The live lactic acid bacilli in the dry buttermilk will keep your flock in glowing health: (bulletin 162 U. S. Agr. Exp. Sta., Berkeley).

cashire Moonies and Yorkshire Pheasants; while such a variety as the Penciled Hamburgs were either wholly unknown or else were so little thought of that they have left no record of their origin, if, indeed, they are natives of England at all." These Penciled Hamburgs were probably imported directly from Holland where they were originally known as Dutch Everyday Layers or Dutch Everlasting Layers. The average Hamburg pullet, it is said, will begin laying at four or five months of age, and will lay from 150 to 200 eggs the first year under favorable circumstances. The second and third years' hens will average from 175 to 225 eggs when properly cared for. After this productivity gradually declines, though there is one Black Hamburg hen on record that laid 220 eggs in ten months when she was five years old.

No other breed has so little of the brooding instinct.

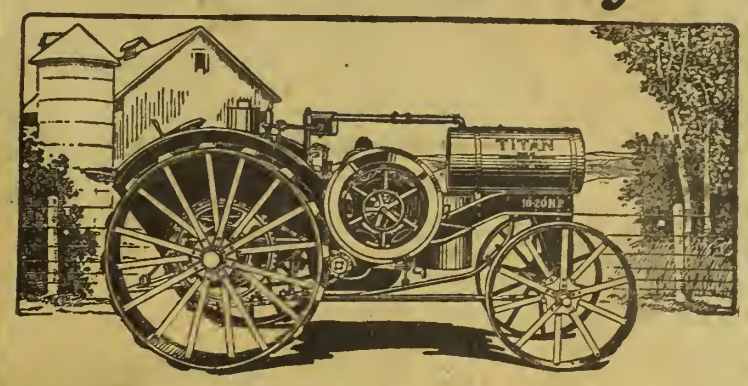
Tractor Safety



FOR twelve years and more, shrewd and careful American farmers have kept us busy filling their orders for **International, Mogul, and Titan Kerosene Tractors.** In those twelve years our tractors have had to meet every possible combination of field and climate conditions. The types and sizes we sell today are the ones that have successfully met every test. Any one of them is a safe tractor to buy.

One great advantage to farmers who buy our tractors is the fact that we can also supply all the implements and machines that go with the tractor. We know farm needs. Buying from us, you get a complete, well balanced outfit for field or belt work.

Another advantage is our extensive dealer and branch house organization. A telephone call to a nearby dealer brings you promptly a repair, replacement, or adjustment for any machine we sell.

Look at it any way you will, you cannot make a safer tractor investment than to buy an **International, Mogul** or **Titan** kerosene tractor. See our dealer in your town, or write us for full information about a safe tractor for your farm.

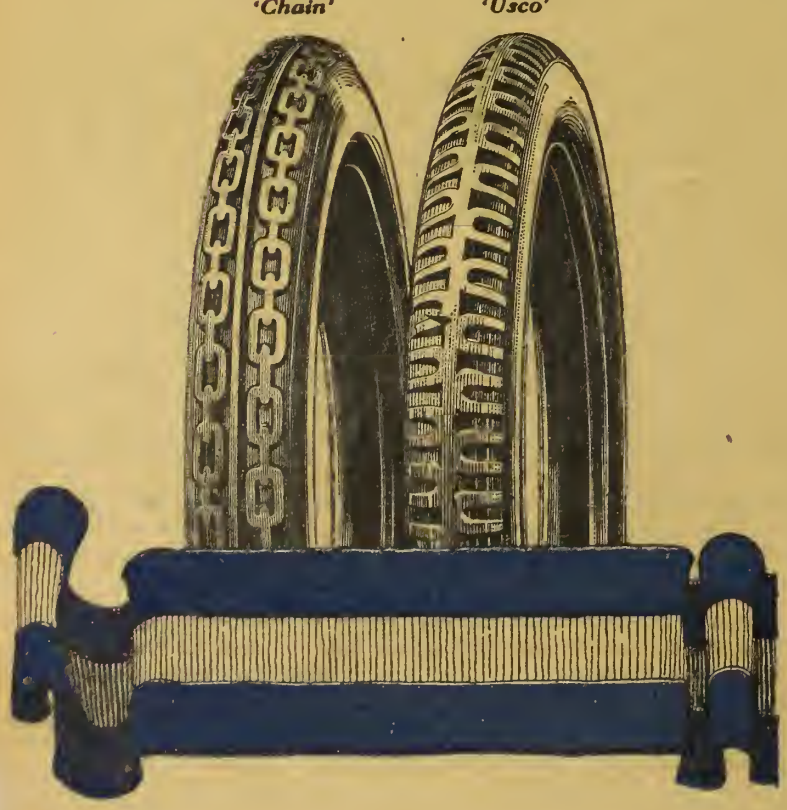
Facts vs. Guess-work

United States Tires are Good Tires

'Chain' 'Usco'



"This car is as much a part of my farm as the barn is. It's working every day. It's a business proposition. So I'm going to make her upkeep strictly business.

"These United States Tires are a beginning. I've been investigating and gathering evidence all over the country. I'll bet I've talked to a hundred farmers who drive cars. The majority vote is United States Tires for long wear and economy. It was unanimous with the fellows who are keeping books on their cars and finding out what it costs them to ride a mile or a hundred.

"You see I'm starting on the idea that quality pays in the long run. I'm fitting the car out right to begin with. That's the way to shove down the little old-cost-per-mile at the end of the year."

Any sound investigation of tire costs among experienced motorists will lead you to United States Tires as business-economy equipment.

There are treads and types for every purpose—all United States quality.

Any United States Sales and Service Depot dealer will cheerfully aid you in selecting the right tire for your car and your roads.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscribers must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Whether soil analysis and the addition of chemicals to a soil makes it richer may be a moot question; there is no question in the mind of any grower as to the necessity for humus or proper mechanical condition of the soil before it will give profit to the grower. Remove the vegetable matter, and a soil of putty like consistency remains, or, possibly, a collection of particles of sand. But the keeping up or bettering of this mechanical condition of soils is becoming one of the most serious problems for the orchardist. The farmer may rotate his crops and secure better results or at least stand off the inevitable day of reckoning. The orchardist buys manure, so far as he can, or he plows under straw or even long-priced alfalfa hay. This at best is expensive, and in order to escape some of the expense, green manure crops are employed. Our illustration on the cover of this issue shows a most successful crop of this kind. Mr. Hodgson treats the question more at length on the opposite page.

FOURTH LIBERTY LOAN

Secretary McAdoo writes: "It is absolutely essential that this loan be a great deal larger than previous ones and I am confident that with the wonderful spirit shown me in my trip to the Pacific Coast, it will be oversubscribed as enthusiastically as the previous drives."

The secretary has not announced size of loan, perhaps six billions, with another this winter. Every farmer will do his share September 28-October 19.

SPEAK NOW

Prof. Woll writes: "There should be no difficulty about having a feed inspection law placed on our statute books at the next session of the legislature if the farmers of the state make their wishes known."

We think Prof. Woll is exactly right in his conclusion, but it sometimes takes a whole lot of insistence to induce a legislator to listen to a farmer's wish. It's a case of prayer without ceasing; and it's none too soon for the farmer to express his wish as to the feed situation. We imagine the coming state fair week will hring live stock people and others together in a way which will give opportunity to express a wish as to legislation needed.

WHO'S TO BLAME?

The U. S. food administration is probing the recent Turlock slump in cantaloupes. So far as can be learned the growers have suffered a loss around $50,000 and the consumers have had no material advantage because of the low prices. It is rumored that "somebody is to blame." Whether it was merely an accident or the result of profiteering plans of some large handlers is what the government is asking. Parties responsible for supplying cars to the shippers admit there was a slight shortage of iced cars on August 2 when prices dropped to 50 cents a crate. Investigation has shown that during the slump over 100 cars were shipped out. Some landed in New York at $875 total cost, bringing on that market $1750.

MORE WOOL

Stanislaus County farmers have appointed a committee to cooperate with experts of the U. S. department of agriculture who are calling attention to the possibilities or greater profits from wool growing. It has been estimated that Stanislaus County can produce five times the present number of sheep and with profit to everyone that engages in the industry intelligently.

We believe that many a California farm will be enriched and made more profitable by the installation of a few sheep. At least give them a chance along the ditch banks where they will not only turn weeds into wool but reduce the amount of bank cleaning often necessary.

POULTRY PRODUCERS

Regarding the attack on the Poultry Producers Association, to which the Cultivator referred in the last issue, we are informed by a member of the association "that the petition referred to came from a very few disgruntled members, some of whom have never given the organization their hearty support."

It appears in this case that the petition filed before a food commission which had no control over the exist ence of the organization was probprobably only for the purpose of em harrassing the management." The Poultry Producers of Southern California, Inc. is a purely cooperative organization endeavoring to secure just return to the producers, and the Cultivator would in every way encourage such an organization. This institution is making good, for it has the type of people who will make it successful.

PEACH PEELING "PATENT"

Here's a piece of news clipped from a Monday daily which has great interest for fruit growers of California:

"The famous 'Dunkley Patent' suit, involving millions of dollars in yearly revenues and affecting the entire canning industry of the United States, was decided recently by Federal Judge Oscar A. Trippet in favor of the Pasadena Canning Company and George E. Grier, defendants. The court instructed attorneys for the Pasadena Canning Company to prepare its own decree in the patent infringement suit.

"The Simon J. Bunkley Company of Kalamazoo, Michigan, which was mentioned as being controlled by Swift & Company, claimed the sole right to use the patent peach-peeling machine which suddenly revolutionized the canning business. The Pasadena Canning Company also was using such a machine, and claimed that George E. Grier of Pasadena had invented the first peach-peeling machine successfully used in the business."

The trial lasted six weeks, and involving millions as it did and those millions coming from the fruit growers of the country, we extend congratulations to those who have put money and time into the fight.

Kemper B. Campbell and F. J. Heney conducted the case for Californians while some of the most prominent attorneys of the East acted for the Michigan claimants. More than 60 witnesses were brought from Michigan.

THE FOURTH LIBERTY LOAN

No matter what amount it is, we, the general patriotic Americans, only know that SIX OR EIGHT BILLION DOLLARS is needed and that we will raise it.

Germany's people, faltering at home as their soldiers are faltering beneath Foch's blows in the field, only raised enough in their last loan, we are told, to pay interest on previous war levies. Turkey's last feeble effort before she quit the Central Powers, was to raise twelve MILLION dollars of a proposed $32,000,000 loan.

Real sacrifice of many comforts will be the means by which many American families swell their purchase of Fourth Liberty Loan bonds. Those whose service flags bear a star of gold will not be inclined to sympathize deeply with those who complain at slight economies in the interest of war funds.

Those who stay at home can make no sacrifice comparable with that which those who go on board ship for overseas duty may be called upon to make at any moment.

This Week's War Notes

A nation wide investigation into costs of living has been begun by the department of labor.

A dispatch from Vienna states that Austrian troops in Alhania have recaptured Berat and Fieri.

The post office department has approved increase of wages for employees of the Western Union Telegraph Company.

Spain's latest protest against sinking of her vessels by German submarines has been met by the statement that "Germany can make no concessions with regard to her warfare."

British air men have successfully bombed the railway stations at Luxembourg and Bettembourg, and the city of Cologne. Also from Amsterdam comes the report that Constantinople has been bombed.

The sector occupied by American troops in Eastern France from Verdun to the Swiss border, has been very quiet. It is stated that our troops at their most advanced point are not more than 20 miles from the Rhine.

The new man power bill enlarging draft age to from 18-45 was passed by the House on Friday, by the Senate on Tuesday. Complete plans have been made for registering the new men at an early date in Septemher, presumahly Saturday, September 7.

General Pershing has issued warning against appeals being circulated in the United States for funds for "Thousands of blinded American soldiers heing brought into Paris." Up to August only two blinded American soldiers had reached Paris, General Pershing reported.

The Allied forces in Siberia are in charge of General Otani of the Japanese army. The forces of the different countries will remain separate units so far as matters of administration and supply are concerned but are subject to orders from General Otani as to military operations.

The state council of defense of California has issued orders to all county divisions to place armed guards around all warehouses, docks, factories, and all public buildings where foodstuffs are stored. In addition it is directed that all such buildings be hrightly lighted and that adequate fire fighting provisions be made.

Nogales, Arizona, was the scene of a hattle between American troops and Mexicans on last Tuesday. Two Americans were killed, 29 wounded, and estimates of Mexicans killed and wounded ran up to as high as 100. Five hundred American troops were ultimately in the battle which was along International Avenue, or the boundary line which runs through the town. The fight was started by a Mexican shooting an American sentry when he prevented a Mexican customs officer from smuggling across the line a fellow countryman.

The senate military subcommittee has reported its aircraft investigations. It comments favorahly upon reorganization already perfected while charging to the old organization waste of millions of dollars, improper location of training fields, employment of inexperienced inspectors, and favoritism to contractors. Questions of individual dishonesty were left to the investigation of the department of justice inquiry directed by Charles E. Hughes. The committee also recommended one-man control through the creation of a new department of aviation headed by a cabinet officer.

In response to the Bolshevik declaration of war on the United States our vice-consul at Petrograd has turned over the affairs of our government to the Norwegian minister. Lenine and Trotzy have declared the British, French, and American troops which landed at Archangel, brigands, and have called upon the Russian people to fight them as enemies of Russia. Nicholas Tschaikovsky, president of the provincial government at Archangel, has announced that he will soon issue an order mobilizing a new national army. He also declares: "America's policy exactly meets our wishes. We want to bring about a new Russian front and reorganize the country ourselves. We want the Allies to form a stream of troops behind which we can work out our own salvation."

The story of the past week on the Western Front is one of steady advance by our forces. The British have pushed back the Germans north and south of Bapaume and heavy artillery fire on that city has practically destroyed it as a German base. It is reported that the town is practically vacated and that the resistance being put up by the Germans is simply to hold hack the British until their retreat is safeguarded. Street fighting between British and German troops is also reported on the outskirts of the town. Farther south the French have taken Fresnoy an important outpost of Roye. Violent counter attacks by the Germans north of Soissons have been repulsed by the French. As the battle line stands today from Albert to Soissons it is practically a straight line. Latest dispatches indicate Roye is now occupied by the French. The British and French armies are practically surrounding Peronne.

This Winter's Cover Crops Especially Important

Written for California Cultivator By Robert W. Hodgson

THE state food administration has recently ruled that no substance such as bean straw or alfalfa hay, possessing considerable value for the feeding of stock, shall be used as a fertilizer or mulch in orchards during the period of the war. The present supply of manure is far below the demand, necessitating keen competition among buyers in order to purchase even small amounts. Ready mixed commercial fertilizers are very expensive and their use has not been found wholly satisfactory. Nitrate of soda,

Tulare County Orchard
Mixture of vetch and wild oats which gives heavy growth of humus former.

which the government has been making arrangements to purchase in wholesale lots and to deliver at cost to farmers, is not to be recommended as a fertilizer for citrus orchards. Sulfate of ammonia has advanced nearly 100 per cent in price and is now practically off the market. The situation facing the citrus grower at present virtually is, that if he intends to fertilize at all, he is under the necessity of raising his own fertilizer or, in other words, he must have recourse to a green manure crop. Many citrus growers have felt for sometime that this is the cheapest method of fertilizing, but now there seems to be no alternative.

The last eight or ten years have seen the development and rapid spread of the practice of using winter cover crops in our citrus orchards. At one time or another a large number of different crops have been tried, but in the competition sour or bitter clover, Melilotus indica, has gradually shown its superiority until at the present time it constitutes the most important green manure crop grown in Southern California. Second in importance comes common vetch, Vicia Sativa, closely followed by Canada peas, both of which, however, have servious drawbacks preventing their more extensive use in that they are readily attacked by aphis. Vetch also serves as a host plant for the cottony mold fungus. For these reasons the use of vetch and Canada peas as green manure crops have been decreasing year by year, although on certain of the more open and porous soils, growers have felt that they constitute the only satisfactory winter cover crops on account of the great difficulty in obtaining a stand with the smaller seeded melilotus.

How Valuable are Green Manure Crops?

Although most citrus growers will readily admit that the addition of organic matter and nitrogen to the soil, such as is accomplished through the use of a green manure crop, is probably a desirable thing, especially if the cover crop be handled properly, oftentimes the question is brought up of just how great is the value received from their use. To answer this question among others, ten years ago the citrus experiment station began a series of experiments on the use of cover crops, the results of which are summarized in Bulletin 292 of the agricultural experiment station, by W. M. Mertz, issued recently. This bulletin constitutes one of the most valuable ever put out from the citrus experiment station and every orchardist should have a copy, which may be obtained by writing to University of California Agricultural Experiment Station, Berkeley, or Citrus Experiment Station, Riverside.

In this bulletin Mr. Mertz who until recently was a member of the citrus experiment station staff and who had charge of the cover crop experiments for a number of years, shows by actual measurements that at the end of ten years there is a vast difference in the yield and quality of fruit on trees in the green manure plots and those where winter cover crops were not grown, although given the same care in other respects. Moreover, there is a marked difference in size of tree and in general health in favor of the legume green manure plots. In fact, the trees on the plots where legume green manures have been annually turned under are superior in every way to those similarly fertilized where no leguminous green manure has been used. Green manuring has resulted in a total yield at the age of ten years of 68 per cent more fruit. In addition there has been 63 per cent more of the desirable sizes than on plots not green manured, showing a big difference in size of the fruit. The trees on the green manure plots averaged 30 per cent larger and the legume green manure plots showed the most thrifty condition of all as evidenced by only three per cent "mottled" leaves during the 1912, 1913 and 1914 seasons as against 13.5 per cent for the trees on plots where legume green manures had not been used.

A series of plots using legume green manures as checked against plots using cereal winter cover crops and in addition given varying amounts of heavy nitrogen containing fertilizers, upon which various indicator crops were grown, showed that the use of an average green manure crop of Melilotus indica is equivalent to the application of between 500 and 600 pounds of nitrate of soda per acre. At present prices this would be adding nitrogen to the value of $30 to $40 per acre. The average increase in yields of the indicator crops following the use of legume green manures is as follows: potatoes, 39 per cent; corn, 45 per cent; cabbage, 44 per cent; sugar beets, 43 per cent; sorghum, 25 per cent, and Sudan grass, 18 per cent.

Value Aside from Addition of Nitrogen

The $30 or $40 worth of nitrogen added to the soil, however, does not represent the total value of the incorporation of legume green manures in the soil. Of very considerable importance is the addition of the organic matter, entirely aside from its high nitrogen content. The necessity of adding organic matter to our soils to replenish that lost through oxidation and other agencies has been urged for years. The text frequently used at Farmers' Institutes and Fruit Growers' conventions by Prof. G. W. Shaw used to be "With all your getting, get humus". It would have been more nearly correct had he stated "get organic matter" for we are beginning to believe that it is the active organic matter which is of the greatest value to our soils. Not only does this active organic matter add to our humus content and thus improve the physical condition of the soil but it acts as a source of food for the bacteria and provides optimum conditions for their activity. In addition it plays the very important part of setting free locked up phosphorus and potassium through its decomposition.

Cover crops have other advantages such as the prevention of erosion on hillside land, perforation of plowsoles, and absorption of soluble nitrogen, preventing its loss through leaching by winter rains.

How to Handle the Winter Cover Crop

It is of the utmost importance that a good stand be obtained in order to get full value from a green manure crop. With our great variation in soils it is to be expected that methods used in one section will not necessarily prove satisfactory in others. Indeed, it is in the question of how to handle the soil so as to obtain a good stand that the citrus orchardist is at present most interested. In certain sections the opinion is freely expressed that a winter crop is not possible on account of the difficulty in getting a stand. Melilotus has shown a wider adaptation than any of our other cover crops, and it is the writer's belief that it can be grown practically everywhere if only growers will experiment and try various methods of seeding and irrigating until the right method is found.

In the rocky, porous soils from Glendora east through Claremont many growers have complained that it is practically impossible to get a stand with Melilotus although vetch will do fairly well. The difficulty is that the soil takes water so readily and lateral seepage is so slight that it is difficult to irrigate a small seeded crop like Melilotus. The usual method of broadcasting the seed, followed by a light harrowing, does not result in a satisfactory stand except right in the furrows where the water wets the surface soil. The writer has talked with several growers in this section who have made a success in getting a stand, and they all seem to agree that the seed should be planted deeply, down where it gets to the moisture. This can be accomplished by cultivating it in deeply or by drilling. A number of suggestions of value have been made by growers for seeding soils of this open porous character. One is to furrow out and irrigate. followed by broadcasting the seed in the irrigation furrows and on either side as far as the water has "subbed". Then, later, furrows are run between the original ones, and the process repeated. In this way a fair stand may be obtained even on rocky soils. Another suggestion is in the use of a portable sprinkler system, using a small centrifugal pump to be installed on a water box, developing enough pressure to force the desired amount of water through a system of pipes or hose provided with sprinkler nozzles at suitable intervals. This suggestion if worked out would add another member to our list of specialized citrus operators, the cover crop irrigator.

The method which has given the best success with Melilotus over a wide variety of soil conditions has been to broadcast one-half the seed on the dry soil mulch before furrowing. The soil is then dragged lightly with

Continued on Page 207

WINTER COVER CROP

Here is an illustration used in a former Cultivator. The above photo, taken by J. R. Garthwaite in the foothills not far from San Gabriel River, is a good "horrible example" of an orchard in which there was no cover crop. The soil had been kept thoroughly cultivated and when the flood of 1914 struck the orchard every particle of surface soil was washed away and in its place a mass of boulders and gravel was deposited. The surface of other orchards nearby in which heavy crops of rye or other soil binders were planted were preserved almost intact. This is ordinarily a secondary consideration of cover crops, though in this particular case a most vital one.

Agricultural News Notes of the Pacific Coast

Northern California

Prizes for Shorthorns at the state fair total over $2000.

Gridley, Butte County, will have a new dried milk factory.

Canneries of Sutter County have closed on Tuscan clings.

The big sugar factory at Manteca began its initial run August 12.

Placer County peach growers report offers of $80 per ton for clings.

A number of pig clubs have already been organized in Shasta County.

Tilly Alcartra, famous Yolo County cow, is being featured in movie films.

Farmer's short courses at Davis farm school September 3 to November 8.

Hop growers are calling tobacco men to their aid in their fight against prohibition.

Shipments of live stock from California during the month of June total 4473 carloads.

State Forester Homans has been conducting meetings of fire fighters in Amador County.

Butte County has secured a farm adviser. D. N. Sweet has been appointed to the position.

Women and girls over 14 are paid $2.50 per day for picking fruit in El Dorado County orchards.

There is a large increase in number of sheep and cattle grazing this year in the Trinity national forest.

A yield of a bale to the acre is expected on a 1500 acre tract planted to cotton near Chico, Butte County.

Farm Adviser Baade of Napa County reports many complaints of cracking of prunes and dropping from trees.

At a recent meeting in Chico of prune and apricot growers it was declared that there was no shortage of labor.

Alfalfa growers of Clarksburg, Yolo County, have organized a branch of the California Alfalfa Growers' Association.

The government is paying $7.50 per ton for peach pits delivered at packing houses of the California Peach Company.

Farm Adviser Merrill will have an assistant who is an expert in poultry raising. E. J. Hauser has been appointed to do this work.

The first stock sale of the Nevada County farm bureau was held on a ranch near Grass Valley on August 15. A number of beef cattle were disposed of.

The Napa County fair has been postponed to October 10-12 because of construction work on the state highway leading in from the Sacramento Valley.

Under the direction of the food administration at San Francisco, all the fishing organizations of the bay region have been pooled into one organization.

Cool weather of the past month has been very favorable to growth in bean fields of Sutter County, and excepting in fields on high ground where no irrigation can be secured plants are looking well.

Directors of the Humboldt County fair are actively at work planning many exhibits for the fair to be held at Ferndale, August 21-24. Effort will be made to have an especially good display of live stock.

Central California

Beans are showing up well in San Luis Obispo County.

Ripon is shipping six to eight cars daily of melons and tomatoes.

Many farmers in Monterey County have this year irrigated barley and wheat crops.

Observance of August 31 as National Egg Day is being urged by California poultrymen.

The apple crop in the Salinas Valley of Monterey County is reported as only half that of last year.

Visalia prune growers expect heavy tonnage of prunes. They met last Thursday to fix schedule of prices.

Shortage of milkers has forced many dairy men of Monterey County to go into the bean raising business.

Monterey, Monterey County, will ship about 15 carloads of apples, 25 per cent under last year's shipments.

Free transportation of exhibits to and from the state fair will be allowed by the railroads as in former years.

It is reported that the California Raisin Company has sold all of this year's output of layer and cluster raisins.

Apple shippers in Watsonville expect the Pajaro Valley to put out about 85 per cent of its normal crop of Newtowns.

Barley growers of Madera County are trying to get together on some sort of a plan to market their crops at reasonable price.

Turlock cantaloupe growers are endeavoring to prevent some of the overanxious ones marketing green melons to the detriment of everybody's returns.

The Salinas Valley of Monterey County shows bean fields in excellent condition due to the cool foggy weather which has made up for deficient rainfall.

Peach pits are being saved for government use by all canneries; the Red Cross is forwarding small amounts saved by home canners. The government price is $7.50 per ton.

Horticultural Commissioner Howard of Kings County reports a serious outbreak of the sphinx moth in the Delta View section; it has completely defoliated a vineyard of 18 acres.

Farmers of Stanislaus County have pooled and sold to the government 30,000 pounds of wool. The farm bureau is also signing up farmers who will place a few sheep on their ranches.

Managers of the Tulare County Live Stock Association have decided to go ahead with their plans for building a sales pavilion. The first auction sale will be held there November 21. It will be of registered Holsteins.

There will be local center meetings of the Santa Cruz County farm bureau at Upton August 16; Happy Valley, 23; Santa Cruz, 26, Soquel, 28. All these meetings will be held at 8:30 p. m. There will also be a directors' meeting August 3 at 10:00 a. m.

The food administration is investigating the disastrous slump in the Turlock cantaloupe market. It is charged that during the glut caused by a break in the market buyers in the field cleaned up $50,000. Melons during the slump were put down in New York for $875 a car and brought $1750.

Southern California

A date festival will be held at Indio some time during October.

Imperial Valley estimates its coming cotton crop at $15,000,000.

Some 15 or 20 farmers in the Victor Valley are growing broom corn.

All of the beet sugar factories in Orange County are now slicing.

The California Packing Co. at Santa Ana is now working on pimientos and chiles.

The pest of worms is disappearing from the bean fields of Ventura County.

The first shipment of dates from the Coachella Valley was sent out on July 29.

The honey yield of Ventura County is estimated by County Bee Inspector Cale at 2,000,000 pounds.

The new packing house of the Yucaipa Apple Growers Association is now ready for operation.

Riverside County has decided to make an exhibit at the Liberty Fair at Los Angeles in October.

Former Farm Adviser Sullivan of Imperial County has entered the navy. His successor will soon be appointed.

Ventura County had over a quarter of an inch of rain on August 15. This was the second rainstorm of the summer.

A slight rainfall in the Palo Verde Valley was of benefit to cotton growers, but caused washout on the railroad.

A federal entomologist is stationed in Imperial Valley to give aid in combating insect pests. His office is in El Centro.

The apple crop of the Chino valley is now being harvested. The Chino Apple Growers Association is packing at the Narod house.

County Horticultural Commissioner Brock of Ventura in his last monthly report places the value of Ventura County's crops for the current year at $18,482,300.

Suit against an orange grower of Santa Ana has been brought by the Placentia Mutual Orange Association. It is claimed that he sold 900 boxes of oranges outside the association.

All retail grocers are now compelled by a mandatory order of the United States Food Administration to take the name, address and the number in the family, for every two-pound purchase of sugar.

Imperial Valley ranchers have complained to the federal employment bureau that Los Angeles and Arizona are attempting to recruit laborers in their section although the shortage of labor is already acute.

A volunteer fire fighting force has been formed by 22 Chino ranchers to protect hay from fires. The county has provided the fire fighters with an automobile trailer and supply of fire fighting apparatus. R. A. Condee of George Jr. Republic School is fire chief.

The Bean Threshers' Association of Ventura County has fixed 40 cents per hundred as the minimum charge for threshing and agreed on the following rates of pay per day for labor: Sack sewers, $4; sack fillers, $4.50; hoedowners, $4.50; feeders, $5; pitchers, men, $3 each; two men, $4.50 each; derrick drivers, $3; oilers, $4; firehelper, $10.

The Coast and General

Washington began shipping out Elberta peaches August 15.

Washington will hold its state fair at Yakima September 16 to 21.

Alfalfa in the Kittitas Valley of Washington is bringing to growers $25 to $28.

Arizona will send this month 300 men to training camp at Little Rock Arkansas.

Lane County, Oregon, is making preparation for its anual corn show at Eugene.

Grape growers of Mason County, Washington, have formed a marketing association.

The cranberry yield of the Columbia River Valley is estimated this year at 10,000 barrels.

Beet army worm is reported to be making serious inroads in Colorado sugar beet fields.

New York has a fine crop of apples in sight; Virginia crop will be 30 per cent under that of 1917.

Nearly 100.000 farmers attended the big tractor demonstration at Salina, Kansas, the first of August.

Cantaloupe shipments from the Rocky Ford district of Colorado will be about the same as last year's.

Utah has been asked by the food administration to increase her production of wheat this year a million bushels.

Farmers of Lincoln County, Washington, have just erected at Gradelles a grain elevator with capacity of 46,000 bushels.

The Island County (Washington) Gucrnsey Breeders' Association has sent J. M. Pratt of Oak Harbor to Wisconsin to select a carload of pure bred Guernsey heifers for the members of the association.

Women teamsters have made their appearance in Vancouver, Washington. A coal company and an oil company have recently employed women to drive their teams and report their work satisfactory.

Five states in the union have more automobiles registered than there are in all England, but England is using more motor trucks in proportion to the total number of motor vehicles than we are in America.

A brilliant airplane flare has been perfected for use of American aviators. The flare is of 400,000 candle power and hangs from a parachute beneath the plane where it may be released at will of the pilot.

Arizona has a live stock squad of federal and state specialists touring stock districts to give instruction in the handling of range diseases. They have with them a full collection of specimens of poisonous range plants.

The government is arranging to establish in all colleges units of the Students Army Training Corps. Under this arrangement the young men will continue their regular courses of instruction until called for military service.

The women members of the Medina, Ohio, Grange have resolved that "the matrons of said grange refuse to prepare bread, cake, pickles, meatsauce, chow chow and other kinds of chow for the consumption of patrons of the grange during the months from June to October, inclusive, unless such food can be served at a time to take the place of a regular meal."

Making Poultry Pay

By M. E. Bemis

THE relative cost of poultry feed and the selling price of eggs has served to reduce the flocks of poultry on the farms throughout the entire country. In the Salt River Valley a number of the egg farms have reduced their flocks, some practically going out of the business altogether.

As a general rule I have observed that when you see the great majority of farmers getting out of, or into, any particular field of crop raising or live stock raising, it is a pretty fair indication that the majority have found that which is, or is not, profitable. It is true that farmers as a class are not good business men; they don't have elaborate cost systems; many of them don't keep any sort of books, but mighty few hut know whether they are in danger of being sold out by the sheriff, or are able to buy automobiles and pianos.

Now I believe that the poultry business can be made just as profitable now with present feed prices and present egg prices as it has ever been. That it isn't on most farms is due primarily to the fact that we are doing big things in a big way and have little time to give to problems that are intricate.

The American people have adjusted themselves to the changes made necessary by the war with a spirit and speed unbelievable to one who has not lived through and been a part of this transition. The American farmer has gone even farther than most Americans, because he, like them, has sent his sons to France; he has bought Liberty bonds and tightened his belt to conform to the restricted rations. All these the average American has done, but the farmer has done more. He is using tractors to replace man power and horse flesh and horse grain; he has taken his wife and daughters into the fields and orchards; he is utilizing labor that he would not have once considered worth the butter on their bread. The result is that seeing with a broad vision he has reaped on a big scale. We are no longer worrying as much about winning the war with food—we know now that the food question is going to be taken care of—to this extent anyway that we will have enough of wheat with the help of corn and other grains so that we are not going to starve. We are not quite so sure about some of the other staples such as eggs which are necessities, but as it were secondary necessities.

The farmers haven't had the time to give to poultry, and poultry needs a lot of attention that requires time, and in the methods of handling poultry there has come with other changing conditions a still more marked change. Not only is feed of all kinds high, but we cannot feed wheat at all now, and wheat has been the staple poultry feed of the Southwest. Many poultrymen with whom I have talked say they cannot make their hens lay as well with any other ration as they could with wheat. No doubt this is true; it is one of those things that need adjustment, and it takes time and thought to work out the adjustment. It is a matter of finance to substitute a tractor for two men and and four horses, but results are big and warrant the step, and the world needs the grain, the hay and the cotton. To a lesser degree the world needs eggs, and milk, fruit and vegetables, and hy and by we are going to get used to the big changes and get around in the good American way to pick up the loose ends and make the necessary changes that will enahle us to make the little things produce and pay too.

To those who are ahout ready to make the necessary adjustments that will put the poultry flock on a paying basis, the account of this little flock which I will give will he not only interesting hut profitahle.

The hero of this story is Roy Bixby, a young man who was born and raised on a Kansas farm. I don't know where he acquired his love for poultry, and it doesn't especially matter. He got his poultry experience on several California poultry ranches. His father came down to the Salt River Valley and settled and later Roy drifted over here, married and got a job in a bank, hut never for a moment has he abandoned his dreams of a paying poultry ranch. I dislike to spoil this story at the beginning by telling you that it has no ending for the reason that Bixby has gone back to California, still as a hank clerk, but with the same dreams of a profitable poultry farm and richer by the data which he has given me and incidentally several dollars of real money.

A 281-Egg Hen

In May, 1917, he bought 300 day old chicks of one of the breeders on the coast who makes a specialty of breeding egg producers. Thirty of these were lost when they were a week or two old through the negligence of a neighbor irrigator. The loss other than this was very small. Cockerels were culled out as soon as they would do to sell for broilers or fryers and as the pullets matured those that did not show vigor were culled out. He worked out a balanced ration that enabled him to keep the chicks growing rapidly and at the same time was economical. Some pullets hegan to lay in Octoher; in November his flock produced eggs enough to pay for the feed less three dollars; in December the flock paid a profit, and so, starting with that month which he called the first laying month, the record follows. Culling had heen continuous; whenever he found one that was apparently not laying it was culled out. This accounts for a difference in numbers in succeeding months, where the record for the month shows no loss from death. Bixby has studied the Hogan system pretty thoroughly and has made some ohservations of his own in the matter of selection for egg production. To this factor of rigid culling is due in no small degree his success.

Beginning December 1 he had 80 pullets which had cost him 90 cents each. In December they laid 1196 eggs, a daily average of 38.58. The eggs brought $50.32. They ate 6 1-3 pounds feed costing 18 2-3 cents each. Two-fifths of the ration was fed as mash, and the halance whole grain, consisting of half milo and half barley soaked until the sprouts were just starting, about one-eighth inch long. The mash was bran, ground milo and beef scrap. The nutritive ratio was 1:46. The average weight of the eggs was 22½ ounces a dozen. The December profit was $35.33, or a little more than 44 cents each.

The January record was: Average number of layers, 79; loss of stock by death, none; total egg production, 1539; daily average, 49.64; percentage laying per month, 63; average number of eggs per hen, 19½; eggs averaged about 48½ cents a dozen and hrought $60.95. The feed, shell and grit cost $16.10, leaving a profit of $44.85 or 56¾ cents each. The cost of feed for January was 20 1-3 cents each. They consumed 6¾ pounds each as follows: 155 pounds of harley, 133 pounds of milo and 288 pounds of mash in the following proportions: bran 50 pounds, shorts 10 pounds, meat scrap 20 pounds and ground milo 20 pounds.

For February the average number was 78; loss by death, none; total egg production, 1445; daily average, 51.60; percentage of layers for the month, 66. The eggs hrought $53.65 and the feed cost $15.60. The profit for each hen was 48 4-5 cents, average number laid by each 18½ and the average weight of the eggs 23½ ounces a dozen. They ate 6 3-5 pounds each and it cost 20 cents each. The ration was the same as for January and they consumed 261 pounds of mash, 135 pounds of barley and 120 pounds of milo.

For the three months the average feed cost per dozen of eggs was 13 1-5 cents.

For March the average number of layers was 78; no loss; total egg production 1767; daily average 57; the average for each layer was 22.65, percentage laying for the month 73; average weight of eggs 24 ounces to the dozen. Two were broody during the month. The receipts were $50.05 and the feed cost $16.15, leaving a profit of $33.90 and an average net profit for each hen, 43½ cents. The cost to produce a dozen eggs was 11 cents. They ate 140 pounds of barley and 128 pounds of milo and 266 pounds of mash composed of 50 pounds of hran, 10 pounds of shorts, 20 pounds of ground milo and 20 pounds of beef scrap. The mash for the last week in the month was the same except that milo bran replaced the ground milo. The amount for each was 6 4-5 pounds mash and whole grain and the cost 20 4-5 cents for each hen.

The April record is as follows: Average number of layers, 77; loss, one; total egg production, 1660; daily average, 53 1-3; percentage laying for the month, 72; number going broody, 6; eggs sold, $49.10; feed cost, $15.45, profit, $33.65, profit for each layer, 43¾ cents; average number for each hen, 21½; cost to produce one dozen, 11 1-3 cents. The mash was composed of 50 pounds of bran, 30 pounds of milo bran, 20 pounds of meat scrap. The cost of this mash was $3.31 per hundred and they consumed 220 pounds. They also ate 150 pounds of harley (soaked), dry cost $2.60 per hundred, 128 pounds of milo at $2.90 per hundred. The feed cost each was 20 cents and they ate 6½ pounds each.

For May the number was the same, 77; the total egg production, 1618, daily average 52.19; average number laid by each hen, 21; numher going broody, 5; gross receipts, $44.75; cost of feed, $14.90; net profit, $29.85; average net profit for each hen, 38 4-5; cost to produce one dozen eggs, 11 cents. The mash was the same as for April and they consumed 222 pounds. They also were fed 10 pounds of rolled barley, 104 pounds of whole barley and 141 pounds of whole milo. The amount consumed by each hen was 6¼ pounds at a cost of 19 2-5 cents each.

Now to summarize for the six months: The average number of pounds of feed eaten by each hen was 38¾; the total cost per hen was $1.19 1-5; average number of eggs laid by each, 118 and the net profit per hen for the six months, $2.76.

I wish it were possihle to complete the year's record, but as I have said before Bixby has heeded a call to a hetter joh, and what is Arizona's loss will be California's gain.

These records which are ahsolutely authentic serve to show conclusively that when we get around to give poultry the attention which [illegible] we can make it as profitable as it ever was. There is no magic in Bixby's record. In the first place he got good stock from well known egg producing flocks. He fed so as to keep them growing and make them mature early, then he culled and culled thoroughly, again and again. When they began to lay he fed a balanced ration that was palatable, at the same time using as cheap feeds as were on the market.

Of course over it all was the watchful eye of a real poultryman who was always on the lookout for anything that would interfere with steady egg production.

Poultry will pay in these times of high priced feeds if one can or is willing to give to it the same attention that is given to other lines, remembering that conditions have changed and must be met with changes in methods.

The Big Third Annual Tractor Demonstration

Begins September 17

Five full days of intensely interesting features are scheduled. There'll be a special

program every day of the mammoth meet—some event of vital interest to the food producer will be taking place every minute of the day. This will be positively the biggest exhibition of modern farm machinery, tractors, implements and ranch necessities ever arranged.

Exhibition Tents Will Cover 60 Acres
One Million Dollar Exhibition
150,000 Visitors Expected

Your Duty

is to attend this important demonstration so that you can become familiar with every late development of modern ranch equipment.

The Dates—September 17, 18, 19, 20, 21
The Place—Whittier Boulevard, half-mile east of Los Angeles City Limits

No Admission ***Free Auto Parking***

Plenty to eat at the Restaurant. Quick Service. Moderate Prices.

To Kill Citricola Scale Use "CARCO"

There isn't a spray on the market that will clean your trees of citricola scale so quickly, thoroughly, and economically as CARCO.

For proof—

Kills Root Maggots
Kills Canker Worms
Kills Borers
Kills Slugs
Kills Cut Worms
Kills Ants
Kills Red Spider
Kills Mealy Bugs
Kills Mites
Kills Thrips
Kills San Jose Scale
Kills Apricot Scale

Read This Letter

—from the foreman of one of the largest nurseries in California:

"I want to repeat, Carco used 125 to 1 CERTAINLY DOES THE WORK, especially in regard to the SCALE and other common insect pests. I had COMPLETE SUCCESS with CARCO in cleaning up scale on infested orange seedlings."

The original letter is on file at our office, and name and details will be furnished on request.

PRICES, f. o. b. San Jose: Pints 50c, qts. 80c, ½ gals. $1.30, gals. $2.

ARTHUR CANN
197 S. First St. San Jose, Calif.

Here is an Opportunity to Get Choice Breeding in Sows and Pigs

Our fifty sows are bred to the great

Star Leader

or one of his sons and will have FALL LITTERS.

Interested breeders are invited to send for names and pedigrees of the sows and their prolificacy records.

The weanling pigs will be sold at reasonable prices.

Write for particulars.

Lindsay-Strathmore Irrigation Project

Written for California Cultivator By Martha L. Baker

COSTING nearly one and a half million dollars, the Lindsay-Strathmore irrigation district's new water system located in central Tulare County has been completed. Water is now in use from this, one of the largest and most unique irrigation systems in the state of California. It is similar in nature, though considerably larger than the Terra Bella irrigation district located in southern Tulare County.

This irrigation district comprises approximately 15,500 acres. It includes a strip of land, irregular in shape, lying at the base of the Sierra Nevada foothills and about eight miles long and five miles wide, ranging in elevation from 384 to 710 feet. In it is included the city of Lindsay, one of the most progressive small towns of the central part of the state and the shipping point for the largest amount and some of the finest oranges produced in the state. The township of Strathmore lies in the district boundaries also.

The district was organized October 25, 1915, by resolution of the Tulare County board of supervisors, under the amended Wright irrigation act of 1897. The bonds for the district, amounting to $1,400,000, were validated in February, 1917, by the irrigation district bond commission.

The water for the irrigation system is supplied from 37 wells located in the delta of the Kaweah River about six miles north of Lindsay. The water is collected in large redwood and concrete pipes and brought to the district lands in a cement lined ditch. It is distributed through a concrete flume and a second concrete-lined ditch and thence through steel pipe lines to all parts of the district. A total length of 16.57 miles of redwood pipe line is used in collecting the water. The length of the main concrete lined canal is six miles. The length of steel pressure pipe in use in distributing the water is 98.98 miles.

Twenty-nine of the wells are equipped for service this season. All the pumps are of the latest design and are operated by electricity. A total of 1480 horsepower is installed at the wells already equipped. There are two distributing zones served by two boosting plants where a total of 2150 horsepower is installed.

Low Level Canal Which Empties Into Forebay at Main Station

The water is delivered through meters under pressure to all points of the district. The distribution plan is to serve each individual property owner, of whom there are more than 600 in the district, in units of 10 acres where required. The district pipes the water to the property line, the property owner paying for the meters. Water is measured in "acre feet" for irrigation use and in cubic feet for domestic use. An "acre foot" is equivalent to 25 miners inches of water for 24 hours, or 43,560 cubic feet, or 325,851 gallons of water.

The cost of the water cannot be definitely determined until the end of the irrigating season, but the law provides it shall be delivered to users at cost. The cost per "acre foot" for the 1918 season has been estimated at $5.00. Should the actual cost exceed that the users will be assessed to make up the amount. Should it be less the users will be given a rebate or a credit on next season's water bill.

Laying Steel Pipe on Lindsay-Strathmore Project

The increase in the citrus acreage in the Lindsay district during the past several years has gradually lowered the water table in the entire district and so taxed the producing capacity of the district that it was deemed advisable to secure an adequate water

supply from an outside source. And so the scheme of this irrigation district was evolved. It is sure to prove a large factor in the further development of this rich citrus bearing district.

TRACTOR DEMONSTRATIONS

Third Annual Tractor and Implement Demonstration of the Traction Engine and Implement Dealers' Association of Southern California will be held in the outskirts of Los Angeles on the Whittier Boulevard, September 17-21. There will be 350 acres of ground in the demonstration field, and about 60 acres given over to the exhibition tents makes for a great event.

Special significance attaches to the public demonstration because this furnishes the best opportunity for judging the merit of individual tractors. For the public demonstration each tractor is assigned a certain amount of land, allotted in proportion to the manufacturer's drawbar rating for the individual tractor. The amount is what the tractor should be able to plow in one hour's time if it does what the manufacturer claims for it. This allows the spectator to judge for himself whether the manufacturer's ratings are correct. At the beginning of the public demonstration all tractors are arranged in one line and begin work at a given signal. Thus the public demonstration becomes one of the most interesting events during each day. All tractors on the field are engaged in the same kind of work.

The 1917 demonstration was one of the biggest successes of any farm demonstration ever held in America, but this year's event will far outstrip it in size and importance, no expense being spared in making extensive arrangements. Over 100,000 visitors attended last year's meet, but it is predicted that not less than 150,000 will pass through the gates this year. Over 4000 automobiles were parked in a single day last year. Free parking space has been arranged to accommodate 10,000 machines daily this year.

No admission is to be charged. The demonstration grounds are located just one-half mile east of Los Angeles city limits on Whittier Boulevard, easily accessible from all points in Southern California.

NATIONAL HAY EXHIBIT ON DISPLAY

Albert E. Nicholls, president of the Nicholls-Loomis Company, who has recently returned from an extended trip East, attended the 25th Annual Jubilee National Hay Convention, held at Cleveland, Ohio. He reports the gathering a great success in every way.

One of the interesting features of the convention was the hay exhibit. Small sample bales of timothy, clover, Sudan, wheat, prairie and mixed hay, in fact all kinds and qualities, were on exhibit from various sections of the United States and Canada.

For the benefit of those interested, and believing that producers, consumers and dealers in California would be especially pleased to see same, Mr. Nicholls arranged for the shipment of these samples to Los Angeles, and they are now on display at the office of the company, 2505 Santa Fe Avenue, Los Angeles.

The National Hay Association was founded in 1893 with 50 leading hay shippers of the East. It has prospered and grown under wise leadership until at the present time approximately 1250 of the larger and more prominent hay shippers are represented in its membership.

A former president of the association, Geo. S. Bridge of Chicago, is now chief of the forage branch, quartermaster general of the army. The present officers are: Samuel Walton, Pittsburg, Pennsylvania, president; W. H. Toberman, St. Louis, Missouri, vice-president; Albert E. Nicholls, Los Angeles, 2nd vice-president; J. Vining Taylor, Winchester, Indiana, secretary-treasurer.

COVER CROP

Continued from Page 203

a harrow to cover the seed. After furrowing the other half is broadcasted over the furrowed land and followed by irrigation.

Time of Planting

In order to obtain a satisfactory growth before cool weather sets in, planting should be done not later than October 15. The sooner in, the better will be the growth made, although the writer strongly feels that a cover crop planted late is much better than no cover crop at all as the root growth seems to be made somewhat earlier than the top growth and it contains the nitrogen nodules.

Irrigation

It should be borne in mind that, as with the summer cover crop, sufficient water must be available for both trees and cover crop. Although lack of water in the fall does not cause the fruit to fall to any extent, it does have an effect on the size of the fruit. Competition for water between the trees and the cover crop is not desirable. The cover crop must be given enough water to prevent it from competing with the trees until the winter rains set in.

Amount of Seed

The following table is taken from Mr. Mertz's bulletin:

Crop	Pounds Per Acre
Melilotus indica and bur clover	20-30
Fenugreek	35-40
Vetches	70-80
Peas	90-100
Windsor beans	100-200
Lentils	60-70

Purple Vetch

Considerable publicity has recently been given to purple vetch as a green manure crop. It is true that it has shown many desirable features in the experiments at the citrus experiment station. It has produced almost twice the tonnage per acre and has shown more active growth during cool weather. Further it is not so subject to aphis as ordinary vetch. The only hindrance to its widespread use lies in the scarcity of seed, practically none being available for use this season.

SEED TESTING

During the year ending June 30, 1918, the California branch seed laboratory of the United States department of agriculture, located at Berkeley, has tested 2098 samples of seed. This represents an increase of 25 per cent over the previous year. Approximately 65 per cent came from commercial seed houses, ten per cent from farmers; 20 per cent was collected by the division of agronomy through its cereal smut campaign; five per cent came from the custom house in San Francisco; and five per cent from the food administration for California.

Two vital seed questions today under war conditions are: How pure is the seed? What percentage will germinate? The California branch seed laboratory receives seeds from California, Arizona, Nevada and Utah. Samples sent in care of the University of California, College of Agriculture, Berkeley, will be given prompt attention free of charge.

Thus constructed, the GMC SAMSON SIEVE-GRIP TRACTOR has for years proved its ability to meet trying service. It is an unfailing help in time of need.

Like the battleship, all material entering into the construction of the GMC SAMSON SIEVE-GRIP TRACTOR is carefully selected and tested to meet the duty to be performed.

The GMC SAMSON SIEVE-GRIP TRACTOR is simplicity itself. It is powerful and reliable. It displaces ten horses on the farm and is adapted to countless uses, stationary and otherwise, for many of which horses are not suitable.

The GMC SAMSON SIEVE-GRIP TRACTOR will do your plowing, discing and cultivating in field, orchard or vineyard and do it better, cheaper and quicker than any other power.

The GMC SAMSON SIEVE-GRIP TRACTOR will pull your binders and small harvesters, drive your grain separators, run your bean threshers, operate your ensilage cutters and blowers, pump your water, do your odd jobs, and CUT YOUR COSTS.

Buy a proven product.

For further information send for our booklet, Better Farming, or see the GMC SAMSON SIEVE-GRIP TRACTOR on exhibition at the State Fair, Sacramento, Cal., August 31st to September 8th. inclusive.

Orange Details with Special Reference to Suckers

Written for California Cultivator By D. J. Whitney

IT IS a surprising fact that the importance of preventing suckers or water sprouts from growing up and becoming a part of a navel orange tree is not more commonly recognized by orange growers. It seems an undeniable fact that genuine, simon pure water sprouts, which grow straight up from the crotch of a Washington navel tree if permitted to do so until they rob the remainder of the branches of food and dominate the whole tree, will always produce rather inferior oranges resembling the Australian navel, if, in fact, the Australian navel is not actually derived from just that kind of growth.

Good and Bad Suckers

People have spoiled hundreds of trees by not knowing the difference between good and bad suckers. To pull off every long, green, soft, vigorous shoot under the belief that it is a sucker, is disastrous and prevents a tree from amounting to much. A genuine water sprout, the bad growth, comes usually from the crotch, off quite old bark, or perhaps a secondary crotch. It grows straight up with extreme vigor and may not branch for several feet. In a couple of years it will be as thick or thicker than other branches and the bark will show that it is much younger than they. This growth will keep on, showing in its nature that it is a different kind of wood from the rest, and it will rob the whole tree and produce only rough, second grade fruit and not too much of that.

A fruit wood sucker may come anywhere, but usually comes out from the branches; it may be extremely vigorous, but its branching, twisted habit, as practically all of these go off to the side somewhat, helps distinguish it from a water sprout, and then when it matures a little and the bark hardens and blackens, it can easily be recognized as fruit wood, while the bark of a water sprout will continue to show its real nature for a couple of years. The quicker a genuine water sprout is removed the better, but the more growth that can be put into fruit wood suckers the quicker they will make a bearing tree and the better the tree will be. An orange tree that is stunted too long always has difficulty in making good finally.

Prune Them Out

Just as soon as a man discovers that he has let water sprouts get established he should remove them, subject to special reasons for delay, for the longer they are in the more they will hurt the tree. R. W. Hodgson, assistant farm adviser of Los Angeles County, had this to say about removing established water sprouts in summer in Central California navel orchards:

"I am certainly of the opinion that water sprouts, if left in young navel trees, will starve the tree and cause a deterioration of what good wood there is. Although the starvation does not change the tree to the Australian navel, which is a separate sport, it does make the tree take on an Australian navel-like appearance. Sucker growth is fast growing, but deteriorates early, and the slow growing fruit wood is what is to be desired. The question of whether to remove these shoots at once or not depends upon, first, how much of an opening would be made in the trees by their removal, and, second, upon the size of these suckers.

"In your hot climate, unless the main limbs were whitewashed, you would be very apt to get sunburn following the removal of these vigorous water sprouts. Where this would not occur I would remove these objectionable branches at once unless they are too large. If there are several on a tree and they are quite large, the shock incident to their removal would result in the tree sending out a forest of vigorous vegetative growths which would require thinning and topping. In such cases I would distribute the response over the tree by removing the least objectionable at the present time. Then later in the fall I should take out the remainder."

Irrigation and Suckers

The more a person has to do with oranges, the more impotant becomes the question of irrigation. There are many sides to it, and one important side is the question of suckers. This comes about on account of the nature of the tree, its habits, the way it grows. For instance, it is often stated correctly that an orange tree quits growing when the ground gets a little too dry, and then when irrigation comes it does not start in growing from the place it left off but seems to think that the growth which stopped was old growth, and sends out new shoots. This explanation is doubtless clear. Just how this habit affects the tree if irrigation is done properly, or improperly, can be seen quickly.

A young tree, for example two or three years old, starts off growth in the spring. It naturally sends out quite a number of vigorous shoots, fruit wood suckers, if moisture is sufficient and cultivation attended to. Keep the ground properly moist and these shoots will keep growing and soft from one irrigation to another, and when fall comes the only long growths will be those which started out in the spring, and they will have continued enough to make quite long, sturdy branches. Check growth a bit by too long rests between irrigations and they will stop, and when growth begins with the next irrigation it will not be any strong continuance of the old shoot, but mostly a lot of new, small, fine twig shoots. The result at the end of the year will be a ball of dark foliage a foot or so greater in diameter than it was in the spring, and if it keeps up long enough the tree will never get to be any size and it will be nothing but a mass of fine, dead twigs in the center. This is the explanation of such a large number of small trees five to seven years old and as many feet high. The only way to make a tree is to irrigate frequently enough so that a shoot which starts in the spring will keep growing all season without stopping, for once it stops it stops for good.

Water Sprouts and Irrigation

Poor irrigation is likewise a first class way to put water sprouts in a tree. The orange is a tree which can send out shoots anywhere, from twigs or from old bark, even from the trunk itself.

The thing that makes shoots come from old bark, where they almost never ought to come, is to have that

bark get too tight. So, when the ground dries out too much during the time the tree wants to grow, the tree suffers for water, the bark tightens up, and then when new growth starts with irrigation, suckers jump out in a hurry from old bark or anywhere else and they have to be rubbed off. All that vigor ought to go in shoots, if it is a young tree, or into renewing the branches, if it is an old tree, but instead the new growth is checked. The time while the tree is waiting for water is lost and the new growth comes in the wrong way. Further, these shoots that come out from the old bark, particularly if they are on the crotch, are more likely to be water sprouts, wild wood, than fruit wood suckers, and so they are doubly bad.

So, while there is a great deal in knowing how to build up a tree in leaving or removing the right shoots, the basis of the thing is in soil treatment to start the growth in the right way in the beginning and then to keep it right. And this is only one side of it; gum disease, nottle leaf, June drop and many other features depend very largely upon irrigation.

Avocados All the Year

Written for California Cultivator By Ernest Braunton

DURING the past two weeks I have been visiting a few avocado growers, looking over the trees, crops, etc., and talking with the men who care for them. I am more than ever impressed with the future of this fine fruit. I am not dealing with the matter commercially nor advising the planting of orchards. I am not gathering statistics as to the acreage planted, what numebr of fruits are produced locally, those imported, the number consumed or probabe future consumption. I am thinking of the garden, the home orchard, and their owners.

I believe in avocados for home consumption and don't care a penny whether a fruit is ever sold or not. Personally I am very fond of the fruits and would see the trees planted in the home grounds of all who find the fruits palatable. I would plant two avocado trees in every yard, whether in the orchard or garden as pure ecomics, or as ornamentals, where they may serve a dual purpose. If I had space I would plant four trees for I find it quite possible in using four trees to provide for ripe avocados every month in the year, "a consummation devoutly to be wished," by yours truly at least. Avocado trees may be had that will furnish fruit four or five months continuously. Others are good for but two months. But a list of four may be found that will give us fruits all the year through, and we should have 'em.

Fine Shrubs

A few days ago I saw a garden in which were several fine masses of shrubbery, in some places a dozen or more of one kind of a solid mass. Three sorts dominated: escallonias, pyracanthas and cotoneaster pannosa. The effects were unusually good and all plants were in fine vigor. It is far better to have many of a few kinds than a few of many kinds. The last may be a botanic display or a horticultural museum, but the first only makes the "garden beautiful."

Edible Passifloras

The fruits of Passiflora edulis are the size and shape of a hen's egg, rather smaller, perhaps. In color they are a dull purple. When ripe, one end may be cut off with a knife and pulp and seeds squeezed out or sucked out directly into the mouth. In this way a child will sometimes eat a score in one day. The taste is somewhat like that of a strawberry guava, but still more sharply acid. Last week I had two glasses of jelly made from the pulp, the same being strained to keep out the seeds. The jelly did not set but it was fine. The color was orange. the flavor sharply acid. It was as clear as other jellies made by my better half, so I suppose it was properly jam. Certainly it was good, easily made, and cost little. The vine is quite hardy in local territory and will grow almost anywhere. You are advised to give it a trial.

Autumn Roses

Those who have rested their rose bushes during the past few weeks by allowing the soil to become thoroughly dry, may now prune for autumn flowers. The precise time to do this pruning is hard to stipulate as seasons vary so much. The aim should be to bring roses into bloom when hottest weather is over and yet obtain a fine crop before hard frosts injure these and other flowers. It is a short but glorious crop you should have "betwixt and between." The main crop should come in the spring and after starting rose bushes into bearing in the autumn it is better to again keep water from them to allow new growths to check and harden somewhat before cold weather comes. The rainy season may then start them up when it comes, for you are then beyond the control of growth. If you live in a frostless belt your rose troubles are slight.

Oiled Roads and Paths

Weeds in roads and paths are a serious handicap to garden work, for much time is consumed in the destruction of offending weeds and the time used should often be put on real garden work, so that the garden really suffers in order that its paths may be clean. The solution is not an easy one for the expense of treating walks cannot always be met with ease. Spraying or saturation of soil by a cheap weed killer is good only until a winter's rains wash it all away. A good oiling or a heavy spray with distillate and a sprinkling with sand will in time prove the cheapest treatment and this I would advise. A coarse rose on a watering pot is all the equipment necessary and a rub with a rag saturated with coal oil will quickly clean the rose after use.

Garden Seats

One of the first requisites of a public park is plenty of seats or benches. Why is the public so insistent upon having them when none are in use in the home garden? A garden of any extent without a seat is without a "soul" and devoid of comfort even though consisting of but one large city lot. In my own garden every visitor sits down unless having but a very few minutes to spare and visitors on business are seldom taken into the house, but use the garden seat. The house is for the family and friends and is not for the stranger or business caller. Have at least one garden seat in every home grounds.

The Glorious Springtime

There is no time for growing like the ever warming spring days. For forty years I have grown plants and

TEAGUE QUALITY

CITRUS TREES

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teague's bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experience covering a third of a century warrants the assertion that Teague Quality Citrus Trees possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . . Consultations on citrus planting by appointment. 1918 Price list just out; send for a copy.

sown seeds at all times of the year, but at no season has success been so great as in the spring time. This year I sowed both annuals and perennials once a month for four months. The first was sown just at close of the rains in March. This crop was glorious. One of the sorts was Shirley poppies. After the first sowing none responded so well though the same lot of home-saved seeds were drawn upon and soil was part of the same large bed, while treatment did not vary except in the increasing water supply. The fourth and last sowing of poppies, made in real hot weather, was almost a complete failure, though special care was given. It was made about the first of July. The seeds did not respond. There is no season like the good old spring time.

Coral Trees

Erythrinas or coral trees are not often found in small gardens yet I cannot see why they are so rare. They are very showy when in full bloom and at other times are interesting enough to prove an attraction, even when out of leaf. The color, size, shape, and habit of the flowers are good and I consider any species worthy of garden space. In cold locations the young plants are damaged by an occasional hard frost but none are killed and the vigorous output of new shoots when the gentle spring time comes cannot fail to awaken the admiration of all. The two or three species known locally are much alike and to the average garden owner are of equal value. But remember all are good and you should have one.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Anonymous

It is remarkable the number of thoughtless folks there are in this world. Every week, almost every day, letters come to the editorial desk asking for information, with no name signed. Presumably this is almost entirely due to the rush in which modern Americans live. The question is written and the letter slipped into the envelope, and on it comes to us to go into the wastepaper basket. One before us now is a request for the market news bulletins which are issued by the Los Angeles and San Francisco offices of the bureau of markets, U. S. D. A. Many blanks have been filled out and sent in for these reports, and they are turned over to the bureau. from which valuable reports are sent out. The blank we now have requests reports of five different crops and then leaves off the one important feature, name and address. Of course this was purely thoughtlessness, but we fear there is left in the mind of that subscriber the thought that the Cultivator has been delinquent in attending to its correspondence.

Irrigation of Walnut Orchard

We would appreciate it very much, if you could advise us, if an irrigation within the next two weeks would injure the crop on young walnut trees. We are anxious to plant a cover crop in some of the young orchards, and for that reason would like to irrigate at this time.—Inquirer, Santa Susana.

It is perfectly proper and in fact good practice to irrigate walnut orchards at this time of year. If the ground has been kept moist through the season and the trees are in good growing condition there will be no excessive new growth after the irrigation and the wood will harden properly before the cold weather. The irrigation will cause the walnut hulls to open and very materially assist in the work of gathering the walnuts. It is rather early in the season to sow a cover crop as the small seeds will not come up if covered too deeply and die if too near the surface and they do not have a further irrigation at the time the walnuts are being gathered, which it is very inconvenient to give, so it is usually best to gather the walnuts and then irrigate and sow the cover crop.—J. B. N.

Pruning Blackberries

Please give some information regarding bclackberry pruning, irrigating, fertilizing, especially as to pruning Mammoths.—Subscriber, Los Angeles.

Pruning of berries depends somewhat on locality and conditions. That is, long pruning of vines in section near ocean influences might be best, this so as to allow as much fruit as possible. In other words, allow vines to grow full length and support on trellis or wire. In the hotter interior valleys heading back, say in August or earlier, to induce heavy growth which will shade the fruit might be beneficial. Irrigate heavily after fruit is off, and cut out the canes which have borne this season. This will send strong growth into next year's bearing wood. In cutting back it is better only to take out tender tips which check the growth and induce heavy lateral growth. As to pruning Mammoth we quote from "Farm Questions Answered" as follows: "Mammoth blackberries must be trellised, and when pruning the fruitbearing wood of last year should be cut away entirely, thus depending upon the new growth for next season's crop. If these shoots are too close together they should be pruned out so as not to leave too much vine on the plant. The same rule applies to the pruning of dewberry, loganberry and Himalaya blackberry. All canes which have borne fruit should be removed during July or August. Fruit comes only from canes which are one year old."

As to irrigation, berries are not neep rooters, consequently regular and frequent irrigations are necessary, that is under normal conditions. One of the bigger berry producing sections of California which ships berries to Chicago in carlots and finds that they have excellent carrying qualities never irrigates. This section is in Sonoma County, but few other lands have sufficient moisture to perfect tbe canes for next year's fruit without heavy irrigation. As to fertilizing stable manure is best, used as a mulch.

Ancona Standard

I have some Anconas said to be well bred, and some of them are nearly all black. Which is considered the best, the black or the nicely marked black and white ones? — Subscriber, Long Beach.

The Standard of Perfection prescribes "about one feather in five ending with a white tip" over the whole body of the female, and the same for the male, except in the back, where one feather in ten should be tipped with white.—J. A. K.

Stick-Tight Fleas

My hens are infested with sticktight fleas. I never saw anything like it before. The fleas stick in patches around the head and under the bill. Have applied liberal applications of sulphur, coal oil and lard but the pests don't all die. Can you suggest a remedy?—Subscriber, Whittier.

Vaseline, applied liberally, is a sure cure for "stocktights." You may have to apply it several times, but it smothers every one if you give it a chance. You will have to rid your premises of these pests, however, if you want to keep them permanently off the chickens. That requires a thorough cleaning up and possibly moving to new ground, for if the soil is full of them cleaning does little good. — J. A. K.

Grain Ration for Goats

Please give best grain ration for milch goats.—Subscriber.

This question was referred to C. Lyman Shedden who answers:

One and a half pounds of oats divided between morning and night feed. I specify oats as barley should not be fed to does in milk. Bran of a desirable character cannot be obtained and beet pulp just at present is too high priced considering feed value. Goats varying in size and nervous temperament will consume varying amounts of feed, depending largely also on amount of exercise the animal has. My answer to question is a good average but will supplement same by stating that a safe rule for a novice is to feed animal all the grain she will eat before leaving it and no more.

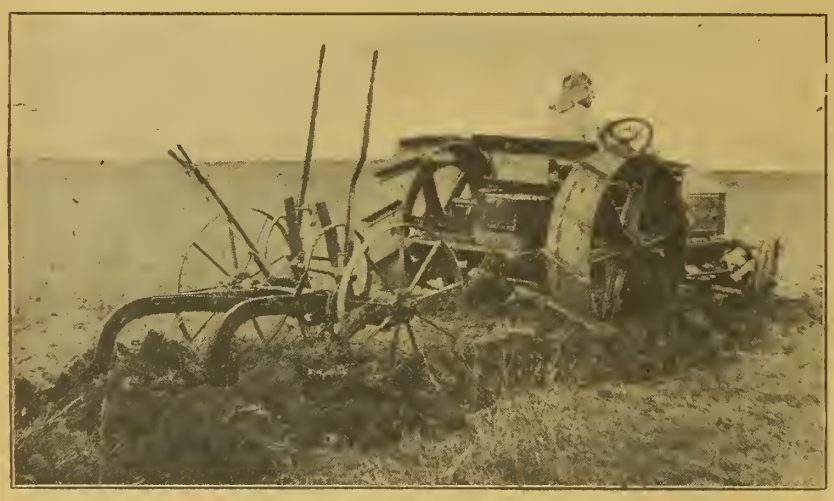
TRACTORS FOR MANY USES

The tractor is so valuable in many ways on the farm that there have been no end of uses for it. It will prepare the seed bed, pull tbe drill that puts in the crop, will pull the binder to harvest it, and drive the separator to thresh it.

Besides this owners may use them for feed grinding, baling, shelling, pumping, sawing and running any kind of machinery that runs from belt power.

It isn't a question of "Can I afford a tractor." It is a question of "How can I afford to get along without one." For economy of power at a small investment there is nothing that will equal a tractor. The longer you have one the more you will find how much you would not be without it.

Zieglers Tractor Attachment



Pulling 2 14-inch Gang Plows in adobe soil, previous to winter rains.

The Ziegler Tractor Attachment makes a solid, substantial tractor out of your pleasure car of any make—costs less than a pair of horses and will do the field work of from 6 to 9 horses—It has 48 inch rear wheels with 12 inch face, fitted with 18 2½ inch grousers which are easily removed for boulevard hauling. Anyone able to operate an automobile can operate this simple tractor.

Valuable territory open for live agents.

We will demonstrate the Ziegler attachment on any ranch within 100 miles of Los Angeles.

Write for descriptive circulars, prices, territory reservations and agents' terms.

Zieglers Tractor Attachment, 611 N. Western Ave. Los Angeles

WATCH FOR REGISTRATION DAY

The President of the United States will soon announce by proclamation, a Registration Day to be held as early in September as possible.

More than 2,000,000 men are needed to put our army on a 5,000,000 men basis. 13,000,000 are expected to register.

Class one is nearly exhausted. This Class must be replenished from new registrants not later than October 1st.

Who must register:

All men from 18 to 20 years of age, inclusive and
All men from 32 to 45 years of age, inclusive, should watch closely for the President's Proclamation, definitely designating who must register.

Where you will register:

In the customary voting precincts in the jurisdiction of your Local Selective Service or at other points to be designated.

Sick and non-resident registrants:

These will be furnished cards by their Local Boards. The sick will be registered by persons deputized to do so. Non-residents may register by mail through the County or City Clerk of the place at which they are stopping. Special provision will be made for felons, persons awaiting trial and others confined in jails or institutions.

The Government of the United States asks your hearty co-operation with your Local Board in making the registration a complete 100 per cent catalogue of every man of the ages to be announced in the President's Proclamation. Selection will take place later by the usual classification method.

The penalty for failure to register is one year imprisonment and NO man can exonerate himself by the payment of a fine

Patriot FARM Truck

Built for Country Roads
Built for Country Loads

The Patriot is the first Motor Truck built especially for farm work. *It is equipped with a practical farm body,* similar to what you have always used on your farm wagon.

It saves horses and high-priced feed. *It brings better markets nearer,* for with a Patriot you can readily drive loads to a market 100 miles distant.

It lays down 15,000 to 20,000 pounds at market in practically the same time that a team will deliver 5,000 pounds, literally bringing the farm to about one-fourth its actual distance from market.

Business farmers can easily see how such perfect transportation greatly increases the value of their farms, to say nothing of the convenience in being master of roads and weather. Every farmer with 160 acres or more should find out what a Patriot Farm Truck will save. Write for information.

HEBB MOTORS COMPANY
Manufacturers of Patriot Farm Trucks
1339 P Street Lincoln, Nebraska

Lincoln Model
Capacity 3000 lbs.
Washington Model
Capacity 5000 lbs.

Powerful Patriot Hand Hoist by which the body, when loaded, may easily and quickly be elevated to dump its load.

CORN HARVESTER Self Gathering for cutting Corn, Cane and Kaffir Corn. Cuts and throws in piles on harvester. Man and horse cuts and shocks equal to a Corn Binder. Sold in every state. Price only $25 with fodder binder. The only self gathering corn harvester on the market that is giving universal satisfaction.—Dexter L. Woodward, Sandy Creek, N. Y. writes: "3 years ago I purchased your Corn Harvester. Would not take 4 times the price of the machine if I could not get another one." Clarence F. Huggins, Speermore, Okla. "Works 5 times better than I expected. Saved $40 in labor this fall." Roy Apple, Farmersville, Ohio: "I have used a corn shocker, corn binder and 2 rowed machines, but your machine beats them all and takes less twine of any machine I have ever used." John R. Haag, Mayfield, Oklahoma. "Your harvester gave good satisfaction while using filling our Silo." K. F. Kuegnitz, Otis, Colo. "Just received a letter from my father saying he received the corn binder and he is cutting corn and cane now. Says it works fine and that I can sell lots of them next year." Write for free catalog showing picture of harvester at work and testimonials.

What Are Non-Essentials?

Dean Thomas Forsyth Hunt of the college of agriculture of the University of California has made an attempt to define the much-debated term "non-essentials" as applied to the winning of the war. He says:

"What are the non-essentials, or the relatively non-essentials or the near non-essentials? They are those commodities and services which people buy in order to maintain the standard of living beyond that of primitive folk. The difficulty with this definition is with the word 'primitive.' It has been suggested that primitive people did not wear clothes. Even so, it answers my purpose, which is to call attention sharply to the fact that during war times standards must fall. Our methods of living must become more primitive. The higher our standards, the more apparent our sacrifices and also the greater our opportunities to win this war if only we are sufficiently determined to do so.

"This determination to live more simply is not the duty of any single class. To be effective it must be universal, each in accordance with his ability. The English now wear soft collars in order to emphasize the need for saving food materials. They have also started the 'Save a Match' campaign. The idea of both these campaigns is to emphasize the importance of even small savings, if universal. This is, of course, the basis of our own thrift stamp campaign. The whole basis for the winning of this war, as well as for the abundance of food, is simpler living.

"I have been tempted to start a pledge among men not to wear a necktie until peace is declared. Not because of the importance of neckties, but it would make visible to us the acceptance of the doctrine of simpler living as an important factor in winning this war. It would be much more emphatic than the wearing of buttons and other badges, for which I have a great personal antipathy. I have been told not to suggest so foolish a notion because I might be quoted as saying that the avoidance of neckties would win this war. Of course, a tieless brigade will not win this war, but the idea of universal saving which underlies it is essential. Let us look at it a moment. Is it conservative to estimate the use of two ties per person annually? A high school boy tells me six are required. Is it conservative to say that the average price of ties is 50 cents? There are 40,000,000 males in the United States over ten years of age. Forty million spending $1.00 each spends $40,000,000 annually. It would keep quite a number of Belgian babies from starving, or it would furnish a million overcoats for our soldiers. The men and women who now manufacture ties should, of course, be engaged in making clothing for soldiers.

"Our motto should not be 'How can I make more money?' not 'How can prices be controlled to our benefit?' but 'How can we live on less in order that our government may have the balance to prosecute the war more expeditiously and effectively?' If we do it voluntarily, we are a true democracy. Whether we do it voluntarily or not, we will do it eventually. True or false democracy, we must win. Democracy or no democracy, we shall win.

"Everyone may help to win this war if he chooses to do so. If he is not carrying a gun, it is by supplying his government with more commodities. There are only two ways that the individual can supply his government with more commodities. It is either by producing more or consuming less. Which are you doing?

"If all the billions of all the millionaires, and if all the war profits of all the profiteers were placed wholly and freely at the feet of the government, it would not help one iota toward winning the war unless thereby it resulted in the production of more goods in proportion to the consumption by the civilian population. It is you and I who must win this war. No one else can do much to help us. It does not matter how many speeches we make in public or private. It does not matter how much we denounce the kaiser; nor how many patriotic luncheons we attend; nor how many war committees we are connected with. Unless you and I in some way increase the surplus of commodities and give it to the government we are not doing a solitary thing to win this war.

"Military authorities agree, I believe, that a military decision in the strict sense of that term is highly improbable. If we win this war, as we surely shall win it, it will probably be because the civilian population of Germany is no longer able to turn over an adequate proportion of the commodities they produce.

"It does not make much difference in the long run what commodities you increase, so long as they are needed commodities. If the war lasts less than a year then it does make some difference because it is not possible for a great population to adjust itself to its new conditions in so short a time. In a similar manner it does not matter much what or how or where we save, if only we save, although for the immediate future there is some choice to be made. In the long run it does not matter whether we are consuming the time of the farmer in raising our food or the time of our tailor or dressmaker in making our clothes or the time of the movie actor furnishing us with entertainment.

"You and I will not help to win this war if while we are saving one dollar's

Home and Bean Ranch Near Ventura by the Sea

Home of Mr. and Mrs. Darveau overlooking the Pacific Ocean. It is to be noted that Mr. Darveau makes gas do much of his work but the pony and cart shows the children love animal life. The Shetland pony, by the way, was won by Miss Beulah Darveau in the California Cultivator subscription contest in September, 1916.

worth of wheat we are consuming two dollars' worth of gasoline; nor if when we are saving five cents on our laundry bill by wearing colored shirts we spend ten cents on cigars. When the Lord balances our account, He will find us in red ink. If there ever was anything personal it is this war.

"You and I may try to ease our consciences by blaming the profiteer, but we know we are not treating our consciences fair when we try to do it. No, my friend, there is nothing else to it. No matter who may be making unholy profits, it has little indeed to do with winning this war except as it affects the morale of the people. You and I must win this war."

Save Gas

Sixteen hundred automobile distributors and dealers, located in as many cities and towns throughout the United States and all identified with one of the larger auto manufacturers of the country, now are preaching the doctrine of gasoline conservation. The gasoline-saving poster, which is printed in colors and illustrated with views of aeroplanes, armored tanks, army trucks and military tractors in action, reads as follows:

GASOLINE
Will Help
Win the War
Don't Waste a Drop!

Our own government and our allies are using tremendous quantities of gasoline for war purposes. The need increases every day MORE motor trucks, MORE aeroplanes, MORE U-boat chasers, MORE motorcycles, MORE army dispatch cars, MORE Tanks, MORE tractors and MORE of other gasoline-using war machines are built and put into service.

Every gallon of gasoline this country can produce must perform some useful function in helping to win the war for America and the world. DON'T WASTE IT—DON'T BE EXTRAVAGANT IN ITS USE. SAVE ALL YOU CAN—SEE THAT OTHER PEOPLE CONSERVE IT.

A united effort to reduce all waste of gasoline will serve the allied cause, as well as bring a personal benefit to you in the more economical operation of your car.

Observe These Rules in Operating Your Car

Don't let engine run when car is standing. It is good for starter battery to be used frequently.

Don't spill or expose gasoline to air—it evaporates rapidly and is dangerous.

Don't use gasoline for cleaning and washing—use kerosene or other material for cutting grease.

Stop all gasoline leakages. Form habit of shutting off gas at tank or feed pipe.

Adjust brake bands so they do not drag. See that all bearings run freely.

Have carburetor adjusted at service stations of carburetor or automobile companies—they will make ordinary adjustments without charge.

Keep needle valve clean and adjust carburetor (while engine is hot) to use as lean mixture as possible. A rich mixture fouls the engine and is wasteful.

Pre-heat air entering carburetor and keep radiator covered in cold weather—this will insure better vaporization.

See that the spark is timed correctly with engine and drive with spark as fully advanced as possible without causing engine to labor.

Have a hot spark, keep plugs clean and spark points properly adjusted.

Avoid high speed. The average car is most economical at 15 to 25 miles per hour.

Don't accelerate and stop quickly—it wastes gas and wears out tires. Stop engine and coast long hills.

Cut down aimless and needless use of cars. Do a number of errands in one trip.

Know your mileage per gallon. Fill your tank full and divide speedometer mileage by gallons consumed.

Barley

"The Cultivation and Utilization of Barley" is the title of Farmers' Bulletin 968. The bulletin states that barley should be more widely grown in the Northern and Western states. It is a protection to our grain supply, as it produces a good, nonglutinous flour and can be milled by wheat mills with little change of machinery.

It is an excellent grain feed for stock, being almost the equal of corn. It, however, competes with corn in few places, as it is mostly grown outside the limits of profitable corn culture. It produces more pounds to the acre than oats or wheat. If necessary, it can be seeded later than spring wheat, and hence interferes little with the wheat acreage in the spring wheat region. It supplies the needed grain feed necessary for the increase of live stock, which some time must come with diversified farming in the areas where grain farming is now the only enterprise.

The best lands for barley are well-drained soils that are not sandy. The best returns are obtained from early seeding. The best methods of preparation are fall plowing in the humid-spring region, disked corn ground in the Great Plains, and summer fallow in sections where the crop is winter seeded. The best method of seeding is with a drill, and the best method of harvesting is with a binder. The grain should not be thrashed too close, as broken kernels lower the market value.

The bulletin may be secured by writing Division of Publications, Washington, D. C.

PRIZES FOR LIBERTY LOAN TALK

The Southern California Liberty Loan State Central Committee wants to hear some good talks on the Fourth Liberty Loan drive. To that end it will give $50 for the best, $30 for the second best, and $20 for the third best speech not exceeding 6000 words. Subscribers of the Cultivator who believe in liberty and the loan which will aid in securing it and can transfer their belief to manuscript with the proper degree of pep and punch have an opportunity for pulling down enough to buy one of the bonds of smaller denomination. We believe it will not be necessary to make actual delivery of the address; it may be submitted in manuscript form. The headquarters of the committee is at room 408, 315 West Fifth St., Los Angeles.

Vessels sailing from New York in June were cut more than 25 per cent in their sugar requisitions, to conform to the food administration ration.

Thousands of Western Farmers Look for the Giant Trade Mark

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

The Giant trade-mark on each case of Giant Farm Powder is put there for your protection. When you see it you know you are getting the real Giant Farm Powder—the kind that has been cutting blasting costs for more than half a century.

Giant Farm Powders—Eureka Stumping and Giant Stumping—have become so popular that many other high explosives are often in error called "giant powders." Don't be misled. There is only one brand of Giant Powder. Demand the genuine.

"I have tried all stumping powders on the market under every practical working condition," writes James Foran, Big Lake, Wash., "hereafter I will use nothing but Giant." Joseph Labunski, Cedar Camp, Ore., says, "Whenever I use powder, it will be Giant."

Farm for Profit

and Help U. S. Win the War

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent, produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

Need of Proposed Feed Control Law

By F. W. Woll

THERE appears to be a demand for a feed law in this state that shall protect stockmen and all buyers of feeding stuffs. To my mind the enactment of such a law by the coming legislature is of greatest importance to the live stock interests of the state. California is away behind most of the other states in the Union in the matter of feed inspection work. Connecticut, Massachusetts and Maine passed laws providing for inspection of feeding stuffs over 20 years ago, and during the following 10 to 12 years other Eastern and Central states followed the example set by them, until at the present time over 40 states have such laws on their statute books. It does not follow, of course, that a movement of great importance to one section of the country is necessarily important to other sections, but there can be but little doubt that the need for such legislation in this state is nearly, if not fully, as great as elsewhere.

California passed an inspection law for commercial fertilizers in 1903 which has saved users of fertilizing materials thousands upon thousands of dollars every year and insured buyers goods of a guaranteed composition and quality. There is every reason to believe that a similar law affecting the manufacture and sale of commercial feeding stuffs would prove of as great or greater importance to our stockmen whose annual purchases of feed stuffs run up into the millions. It is true that the feed market in our state does not include by-products from a number of manufacturing industries found in the states east of us, and that our feeding operations are as a rule simple, relatively few feeds being used by most farmers and dairymen in feeding their stock, but in the aggregate a large number of different feeds are obtainable in the state and are either sold separately or used by manufacturers in the making of mixed feeds.

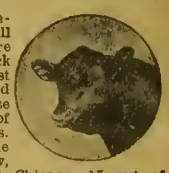
This fact was brought out in a striking manner by a recent study of commercial mixed feeds and their formulas submitted to the live stock commission of the food administration by feed manufacturers in the state. The 94 different feeds of which samples were submitted contained in all 102 different feed components, viz., 41 different flour-mill feeds (by-products in making flour or "cereals" from wheat, barley, rye, oats, rice, Indian corn, milo, Egyptian corn); 20 kinds of cereal grains and leguminous seeds; 12 miscellaneous mixed feeds, condition powders, etc.; 11 kinds of oil meals (cotton seed, linseed, cocoanut, soy bean, rape seed, mustard); 10 kinds of mineral matter, charcoal, etc.; 6 animal feeds (meat meal, tankage, blood meal, whale meat); 2 dairy feeds (dried skim milk, dried buttermilk).

Nearly all these feeds are subject to wide variations in composition and feeding value, and many are of low grade at times due to an admixture of worthless materials that may or may not be intentional. Under feed inspection laws the composition of all feeds must be guaranteed as regards their minimum contents of protein and fat (sometimes also carbohydrates), and maximum fiber contents. Samples are taken in the open market and subjected to chemical analysis and the results are published in bulletin form. With these facts before him the buyer can judge as to the quality of the various feeds offered for sale and the relative economy of feeds sold at different prices, and one may have every assurance that the large majority of manufacturers will furnish goods of the guaranteed quality.

Feed inspection work is of value also to the manufacturer, both because it gives him official backing as to the quality of his feeds and because it protects him from dishonest competition. We find that manufacturers who conduct their business on the principle of furnishing feeds of good quality at fair prices, appreciate the value of feed laws to them and generally give active, whole hearted support in securing the passage of the law as well as in carrying out its provisions when passed. Experiences from elsewhere have shown that states having no feed-control laws soon become the "dumping ground" for low-grade and adulterated feeds that cannot be sold in other states, and also that the quality of the feeds sold is gradually improved under feed control. This will no doubt be the experience in this state as well, and the best interests of the stock men and farmers of the state will, therefore, be served by the passage of a feed-control bill at the next session of the legislature. In order to bring this about candidates for election and the members of the legislature should be informed in no uncertain terms by individual farmers and through the various farmers' organizations that the law is wanted and that the farmers of the state consider it of more importance at this time than ever before to be protected from fraud and misrepresentation in the feed business.

High feed prices and occasional scarcity of certain feed supplies increase the temptation to put out low-grade feed materials and render protective measures even more necessary than during normal market conditions. It would be an easy matter to cite examples of the direct value of feed control work from past experiences, both personal and such as are given in official reports, but it is hardly necessary in order to convince the practical feeder that there is urgent need of improvement in the quality of the feed stuffs sold in the state, and that improvement will be likely to follow the enactment of a feed law. The practice of "buying a cat in the bag," as it were, is neither good business nor in accordance with modern ethics. Time was when the maxim "Let the buyer beware" was a ruling business principle in the world, but now the government extends protection farther and farther as needed and wanted and sees to it that the buyer may receive the kind of goods he expects and of the quality claimed. There should be no difficulty, there-

AT THE STATE FAIRS



Be sure to see the Aberdeen-Angus cattle. There you will have an opportunity at more than 25 leading live stock shows to inspect the choicest representatives of the grand champion beef breed. These show animals are samples of the best American herds. Their produce has won at the world's greatest live stock show, the International Exposition, at Chicago, 15 out of 16 fat carcass grand championships over all breeds, as well as 13 out of 16 fat carlot grand championships, 11 out of 14 steer herd grand championships, and 10 out of 16 single steer grand championships. Calves of the breed have been demonstrating their baby beef making superiority at shows and markets from Canada to Texas. The bulls of the breed have been getting market-topping steers at all leading markets, demonstrating their place in the winning of the war. **"Ask the man who owns some!"**

fore, about having a feed inspection law placed on our statute books at the next session of the legislature if the farmers of the state make their wishes known.

TO SHEEP AND WOOL GROWERS OF CALIFORNIA

FOOD Commissioner Merritt is sending out this message:

Notwithstanding the fact that the food administration has no responsibility in connection with the growing or marketing of the nation's wool supply, the matter of maintenance of an adequate amount of meat for the use of our people at home and our soldiers in the field is so closely related to wool production. in so far as the mutton and lamb crop is concerned, that we feel it very proper and pertinent to urge upon the sheepmen of California such organization as will most effectively promote their industry in the state.

The following brief table shows clearly the relative decrease in the sheep industry in California as compared with the development of population.

Sheep Statistics in California 1890-1918

Year	Population per square mile	Sheep per square mile	Sheep per Capita	Increase in population ten years, per cent.	Decrease in sheep ten years, per cent.
1880	5.6	36.8	6.6	54.3	.....
1890	7.8	21.7	2.5	40.3	41.1
1900	9.5	18.0	1.8	22.4	16.9
1910	15.3	15.5	1.0	60.1	14.3
1918	20.2	16.0	0.7	32.	8.0

Estimated population for 1918 3,138,364; sheep, 2,225,000.

The marked decrease in the number of sheep per capita of population is so serious as to deserve serious consideration.

A movement recently inaugurated by the College of Agriculture to increase sheep production by a campaign for the establishment of a small flock of sheep on every farm is to be commended and deserves your most earnest cooperation.

The time is past when the interests of the sheepman and cattleman are considered to be antagonistic. The most effective use of the ranges of the state calls for an understanding and the closest cooperation among the sheepmen and the cattlemen.

The distribution of the range among sheepmen can be improved. There should be no necessity for sheep in the southern part of the state to be trailed or shipped to the northern part of the state, while northern sheep are ing and shipping should be eliminated by a more effective cooperation.

Cooperation in the use of shearing crews, by so scheduling shearing in different parts of the state that the same crew might go from ranch to ranch, is essential to the most efficient use of labor.

The use of better blood in the range flocks to the end not only that a higher wool clop may be secured but a better mutton carcass as well is most urgently needed in order that the largest possible amount of product in the form of mutton and wool may be had from the smallest number of sheep and the least amount of feed.

The present arrangement for the marketing of wool is temporary. Your attention does not need to be called to the advisability of the sheepmen having well in hand at the close of the war their own marketing machinery. This need is apparent.

The cattlemen and the hog men of the state have already formed organizations which promise to be of the greatest assistance to the food administration by affording central agencies through which they may be promptly reached by the government. An equally strong organization of the sheepmen would be appreciated by the food administration at this time.

VALUABLE TROPHY

Guy H. Miller writes that things will be doing in Jersey circles at the state fair. First, there will be a meeting of the California State Jersey Breeders' Association with a banquet and a genuine good time on September 3, at 8:00 o'clock. Mr. Miller writes "The association extends a cordial invitation to every owner and breeder of Jersey cattle at $2.00 per plate." In addition the state association will hold its annual meeting and election of officers on Wednesday, September 4, on the fair grounds. "Every member is expected to be present."

Another feature which is creating interest is the silver cup offered for the first time this year and to be put up for five succeeding years. The member winning it the greatest number of times in the five years will own the cup. The cup is for a class of five Jersey cows in milk during the time of the state fair. It is a handsome trophy and will be hotly contested for and will doubtless develop the one outstanding Jersey herd in California. There is a liberal entry in this class this first year of the offering.

A CYCLONE SILO Will Save You Big Money On Your Feed Bill

If you are in the farming business to make money you must save as well as earn—a silo will save you its cost in the first year of its use. With a silo you can convert into first-class stock feed a lot of your product that you have wasted in the past—

The CYCLONE SILO

—is constructed to stand up under the most trying conditions. Flat iron bands encircle the CYCLONE (as illustrated) in such a way that it cannot possibly twist or warp out of shape—does not get smaller at top than bottom after usage. No guy wires to stumble over.

We, who make this silo, have been manufacturing wood tanks, wood stave pipe, etc., for use in all parts of the world for 25 years—we know our business and our guarantee that this silo is right means something.

Horse Breeding in California.

Written for California Cultivator By Wayne Dinsmore, Secretary Percheron Society of America

WITH the constantly increasing demand for good big work horses throughout the United States it seems positive that there are many California farmers who ought to be devoting at least some effort toward the production of good draft horses. We fully realize that climatic conditions in California are particularly suitable to the use of tractors, and yet there is always some work on every farm which must be done by horses. Automobiles have taken the place of light horses to go to town on errands where a heavy load is not hauled, and the tractor is found a very useful implement in some kinds of farm work. But the good heavy chunk farm horse that is an easy keeper and a good mover should still have a permanent place upon every farm. No farm, regardless of location, can be run most economically and on a lasting basis without such horses. The need for horses is imperative.

An analysis of the California Stallion Board reports made recently by the Percheron Society of America show that in 1917 there was a decrease of 64 head of pure bred draft stallions licensed as compared with the previous year. It is evident that this falling off is not due to the fact that draft horses are not suitable and that light horses are more effective because in 1916 there were 162 pure bred light horses licensed in the state and in 1917 there were only 85—77 less than were enrolled during the 12 months before. This is a greater decrease than was made in draft stallions. As the figures now stand, there was only one pure bred draft stallion to every 1088 horses owned on the farms and ranches and only one such sire to every 194 farms. A further analysis of this stallion board report indicates that there is only one pure bred draft stallion in California to every 343·60 square miles. No other state needs to look to her horse interests more than California. Just as her farmers need to be encouraged in the production of better hogs, cattle and sheep, so should the economic importance of raising a better class of farm horses be pointed out to her farmers. The farmer who can see far enough ahead to realize his opportunity in horse production is bound to make plenty of money if he acts; and the sooner he does it the better.

Make Soft Cheese at Home

Neufchatel and cream cheese, two of the groups known as soft cheese now made almost exclusively in factories with extensive equipment, can be made in the home. The department of agriculture has worked out a method for their manufacture which is simple and does not require elaborate equipment. The plan offers an excellent opportunity for the disposal of surplus milk on the farm and enables farm housewives to make a fresh, wholesome and attractive food at home.

Neufchatel cheese should be made from whole milk that tests about four per cent, and cream cheese from milk testing six per cent butter fat. Both are made in this way: To a quantity of 30 pounds, or three and one-half gallons of milk, add a pint of good starter or clean flavored sour milk and stir well. Warm the milk between 80 to 83 degrees Fahrenheit. Then add about eight drops of rennet which has previously been dissolved in a cup of cold water. Stir in thoroughly and set the milk aside to curdle. Powdered pepsin (one-half the size of a pea) or one-third of a junket tablet may be used in place of the rennet. The cheese may be made without a starter, in which case the milk should be ripened (allowed to stand at 70 degrees Fahrenheit) for six or seven hours before adding the rennet.

After 16 or 18 hours, the time usually necessary for proper curdling, pour the milk into a drain cloth and allow to drain from two to four hours or until practically no whey drips from the cloth. Then place the bag of curd between two clean boards, put a 50 pound weight upon it and let it stand for six or eight hours. Remove the curd from the cloth to a pail. Sprinkle two level teaspoons of fine salt over it, and thoroughly mix with a potato masher until it has a smooth buttery consistency. Running the cheese through a food chopper or working it with a butter worker produces the same result.

The cheese should then be placed in a crock or enamel dish until ready for use and kept at a temperature of 50 degrees Fahrenheit or below. If it is to be sold, it should be molded into small packages and wrapped in tinfoil, or packed in glass jars.

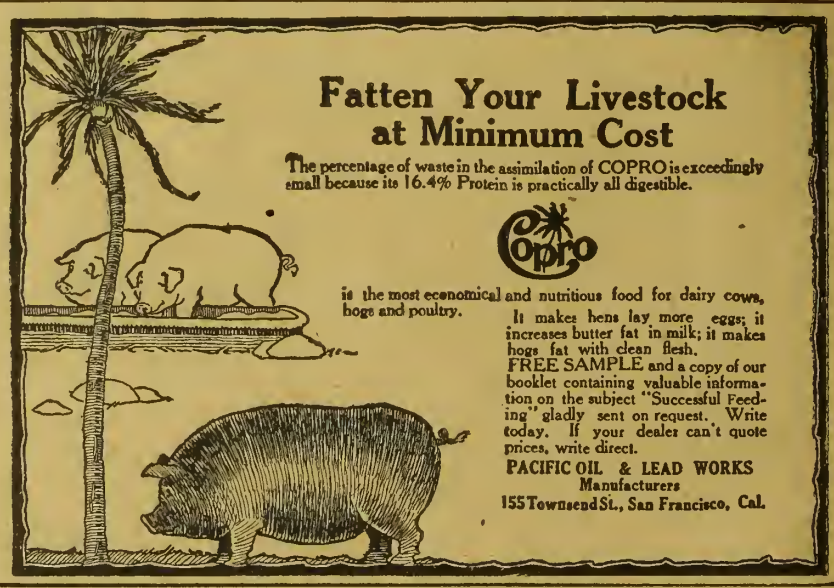
In nutritive value these cheeses compare favorably with other staple foods, especially meat. They are rich in protein and fat and are easily digested. Perhaps the most desirable ways to serve them are in the forms of salads, sandwiches and in combination with other foods such as olives, green peppers, pimientoes, pickles, different kinds of nuts, various vegetables and nearly all fruits.

ORLAND JERSEY CATTLE CLUB

The Orland Jersey Cattle Club held a lively meeting at the Dr. Hand Farm, Thursday, July 25. It was decided that the club have a special Jersey booth at the Glenn County fair which will be held September 16-21 at Orland. The space will be 10x14 in the main tent and is to be used as a Hostess House. It will be a place where fair visitors can rest, write letters and meet their friends. There will be good "Jersey literature" for everybody and easy chairs to rest in while you read it. The name of every member of the O. J. C. C. will be easily obtained; also the pedigrees of their stock and what they have for sale.

The club is going to make a heavy entry in the county fair. Also the Orland Jersey Cattle Club will be well represented at the California state fair. Dr. Hand and S. F. Williams are going to enter a carload of their fine stock.—Mrs. Jacquelyn Nickell, Secretary.

Food control in North America today means chiefly getting the food across the Atlantic at all costs.



Fatten Your Livestock at Minimum Cost

The percentage of waste in the assimilation of COPRO is exceedingly small because its 16.4% Protein is practically all digestible.

Copro

is the most economical and nutritious food for dairy cows, hogs and poultry.

It makes hens lay more eggs; it increases butter fat in milk; it makes hogs fat with clean flesh.

Seven Years Silo Experience

Written for California Cultivator By Geo. A. Smith

I HAVE used two reenforced concrete silos for seven years. They are 20 feet in diameter and 40 feet high. Walls are eight inches thick at bottom and five inches thick at top, reenforced with electric welded wire like the Pittsburg hog fence only much heavier and wider. The wires at the bottom of the silo wall are one-quarter inch, three-sixteenths about half way up, one-eighth near the top. It is the same as that used in the floors of reenforced concrete buildings in cities and comes in rolls and is eight to ten feet wide, and has proven very satisfactory as there is not a crack in the silo after seven years of use.

Reenforced Concrete Silo

Silo on place of James McGillivray, Sacramento, holds 600 tons of corn silage or 800 tons of alfalfa silage.

I have used first crop alfalfa in which there was considerable foxtail, bur clover, alfilaria, barley and other grasses that came in the first crop. I do not run this through a feed cutter but put into the silo whole with a hay derrick. I haul it to the silo from the field immediately after cutting so as to get it into the silo as green and wet as possible. I do not stop for rainy weather, which sometimes occurs in March and April. It keeps perfectly, and is not hard to remove from the silo. I have used some this year that was three years old and found it just as good as the first year. If I do not use it all in any one season I take off the top that is spoiled and put the fresh silage in on top of that which is left in the silo. I use about 15 pounds of salt to the ton.

I have also used Indian corn, kafir corn, milo, feterita and sugar cane. I have also mixed these with good results. These are all run through the feed cutter and a half inch stream of water added. I also use about 15 pounds of salt to the ton of silage with these feeds.

I regard Indian corn silage as the best. Corn silage with alfalfa hay or alfalfa pasturage is pretty hard to beat as a milk producer. My cows produced twice as much last winter as my neighbors who did not have silos. When they were getting from one-third to one-half pound of butter fat per day per cow I was getting one and a quarter pounds of butter fat per cow. The quality of the cows, of course, had something to do with the yield. Neither feed nor breed is the whole thing, but both go very well together, and success in the dairy business is extremely doubtful unless they do go together. I would not think of running a dairy without a silo no matter how much alfalfa I had. Cows need a variety of feed. Nothing but alfalfa all the time is not the best. Reenforced concrete silos I believe are the best and I believe the cheapest in the end. The older they get the better they are, which can be said of no other silo. Concrete improves with age.

I am now, August 20, planting vetch and barley, 25 pounds of vetch and 25 pounds of barley to the acre, for silage next spring to be fed out in the summer before the corn silage is ready again, and also for green winter pasture. I aim to keep up a full flow of milk through the winter.

Stave Silo Being Filled with Rye

The power to operate the cutter and elevator is from electric motor which is very satisfactory and available.

"Slipping" not "Saving"

"I kept slipping back two feet every time I went ahead one." That's what the small boy gave as an excuse to his teacher for being late for school one winter day.

And that's just what is happening to the cow owner who is trying to get along without a cream separator or with an inferior or half-worn-out machine. Like the small boy he is "slipping." He thinks he is thrifty, but for every dollar he saves by not buying a De Laval he loses two through not having one.

It *isn't* economy to do without labor saving and money saving and food saving machines. It *isn't* economy to feed 40-cent butter to the calves and hogs.

It *is* economy to buy and use only the best cream separator made—and that's the De Laval.

Viewed from every standpoint—clean skimming, ample capacity, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

It's real thrift and genuine economy to buy a De Laval Separator NOW.

Why not see the nearest De Laval agent at once! See a new 1918 De Laval machine for yourself. Try it to prove every claim made for it. If you don't know a De Laval agent write direct to one of the addresses below.

Judging Fowls for Egg Production

ONE of the most carefully conducted and helpful egg laying contests is the Northwestern, under direction of the state college of Washington at Pullman. It is under the management of Helen Dow Whitaker. Especial effort has been made to determine conditions which make for a more profitable poultry industry. The next contest conducted by the state college begins on November 5. The director is now sending out entry blanks with rules and regulations of the contest. Among the literature sent out is a report of a committee on judging fowls for egg production, which appears below:

In order to lay well a bird must have a sound body. As a first consideration a bird must be vigorous and healthy if it is to be able to lay well. Vigor and health are shown by a bright, clear eye, a well set body, a comparatively active disposition and a good circulation.

Further, the bird must be free from physical defects such as crooked beak, excessively long toe nails, eyelids that overhang so that the bird cannot see well, scaly leg, or anything else that would keep the bird from seeing or getting an abundance of food.

Loss of Fat Due to Laying

Color or pigmentation changes. (These should be observed by daylight.)

A laying fowl uses up the surplus fat in the body, especially it removes the fat from the skin. In yellow skinned breeds this loss of fat can readily be seen by the loss of the yellow color. The different parts of the body become white, according to the amount of fat stored in the body and the amount of circulation of blood through that part. The changes occur in the following order:

The vent changes very quickly with egg production so that a white or pink vent on a yellow skinned bird generally means that the bird is laying, while a yellow vent means a bird is not laying. It should be recognized that all yellow color changes are dependent on the feed, coarseness of skin and size of bird. A heavy bird fed on an abundance of green feed or other material that will color the fat deep yellow will not bleach out nearly as quickly as a smaller, paler yellow bird.

The eye ring, that is, the inner edges of the eyelids, bleach out a trifle slower than the vent. The earlobes on Leghorns and Anconas bleach out a little slower than the eye ring, so that a bleached earlobe means a little longer or greater production than a bleached vent or eyelid.

The color goes out of the beak beginning at the base and gradually disappears until it finally leaves the front part of the upper beak. The lower beak bleaches faster than the upper but may be used where the upper is obscured by horn or black. On the average colored, yellow skinned bird, a bleached beak means heavy production for at least the past four to six weeks.

The shanks are the slowest to bleach out and hence indicate a much longer period of production than the other parts. The yellow goes out from the scales on the front of the shanks first and finally from the scales on the rear. The scales on the heel or rear hock joint are the index as to the natural depth of yellow color of the bird. A bleached out shank usually indicates fairly heavy production for at least 15 to 20 weeks.

The yellow color comes back into the vent, eye ring, earlobe, beak, and shanks in the same order that it went out, only the color returns much quicker than it goes out. A vacation or rest period can sometimes be determined by the tip of the beak being bleached and the base being yellow.

Body Changes Due to Laying

A laying hen has a large, moist vent showing a dilated condition and looseness as compared with the hard, puckered vent of a non-laying hen.

Heavy production is shown by the quality of the skin and the thickness and stiffness of the pelvic arches. Fat goes out from the skin and body with production so that the heavy producers have a soft velvety skin that is not underlaid by layers of hard fat. The abdomen in particular is soft and pliable. The sternal processes are very prominent and are generally bent outward. The thicker and blunter the pelvic arches and the greater the amount of hard fat in the abdomen the less the production or the longer time since production.

One of the finer indications, but yet one of the most valuable in picking the high layer is the fineness of the head and the closeness and dryness of feathering. The head of a high layer is fine. The wattles and earlobes fit close to the beak and are not loose and flabby. The face is clean cut. The eye is full, round and prominent, especially when seen from the front. The high layer is thinner, that is, the feathers lie closer to the body and after heavy production the oil does not keep the plumage relatively sleek and glossy but the plumage becomes worn and threadbare.

Changes in Secondary Characters.

The comb, wattles, and earlobes enlarge or contract, depending on the ovary. If the comb, wattles and earlobes are large, full and smooth, or hard and waxy, the bird is laying heavily. If the comb is limp the bird is only laying slightly but is not laying at all when the comb is dried down, especially at molting time. If the comb is warm it is an indication that the bird is coming back into production.

Molting

When a bird stops laying in the summer she usually starts molting. The later a hen lays in the summer or the longer the period over which she lays, the greater will be her production, so that the higher producer is the late layer and hence the late molter. The length of time that a hen has been molting or has stopped laying can be determined by the molting of the primary feathers. It takes about six weeks to completely renew the primary feathers next to the axial feathers and an additional two weeks for each subsequent outer primary to be renewed.

Temperament and Activity

A good layer is more active and nervous and yet more easily handled than a poor layer. A high layer shows more friendliness and yet elusiveness than a poor bird. A low producer is shy and stays on the edge of the flock and will squawk when caught.

While the characters discussed have dealt specifically with the current year's production it should be borne in mind that a high producer one year is, generally speaking, a high producer in all other years.

NATIONAL EGG LAYING CONTEST

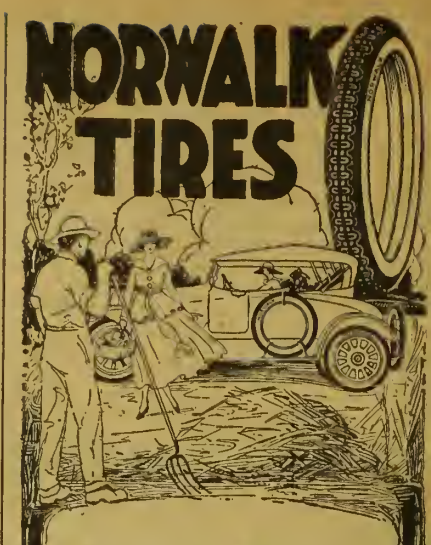
By T. W. Noland, Director

Mountain Grove, Missouri. Pen 36, S. C. White Leghorns, from Missouri, won the cup again for July, with a record of 127 eggs, having won four cups in succession. The total number of eggs laid in July was 4670, or an average of 15.57 per hen. Following are the leading pens for each variety for July:

S. C. White Leghorn, Missouri, 127 eggs; S. C. Reds, Missouri, 111; R. I. Whites, New Jersey, 111; W. P. Rocks, Idaho, 110; W. P. Rocks, Illinois, 110; Anconas, Missouri, 110; W. Wyandotter, Missouri, 109; Barred Rocks, Michigan, 108; Buff Wyandottes, Missouri, 102; R. C. Reds, Missouri, 95; Buff Rocks, Missouri, 91; S. Wyandottes, Missouri, 91; S. C. Brown Leghorns, Missouri, 89; Buff Orpintons, Missouri, 77; Black Orpingtons, Indiana, 71; White Orpingtons, Missouri, 70.

The ten leading pens to date are as follows:

White Leghorns, Missouri, 926 eggs; Whites, New Jersey, 914; Wyandottes, Missouri, 913; Rocks, Michigan, 893; Missouri, 889; Reds, Missouri, 866; Wyandottes, Illinois, 856; Orpingtons, Missouri, 846; Rocks, Missouri, 839; Wyandottes, Missouri, 823.



HAND MADE

The joy of riding is heightened when your car is equipped with these famous casings. Norwalks permit the least amount of road vibration. They bound over rough road surfaces, absorbing the multitudinous jars to a remarkable extent.
